If thou hast a duty, this is thy duty; if thou ask what shall be thy aim, let this be thy aim; if thou demand pleasure, there is no greater joy, for all other joy is broken or limited, the joy of a dream or the joy of a sleep or the joy of self-forgetting. But this is the joy of thy whole being. For if thou say what is my being, this is thy being, the Divine, and all else is only its broken or its perverse appearance. If thou seek the Truth, this is the Truth. Place it before thee and in all things be faithful to it.

It has been well said by one who saw but through a veil and mistook the veil for the face, that thy aim is to become thyself; and he said well again that the nature of man is to transcend himself. This is indeed his nature and that is indeed the divine aim of his self-transcending.

What then is the self that thou hast to transcend and what is the self that thou hast to become? For it is here that thou shouldst make no error; for this error, not to know thyself, is the fountain of all thy grief and the cause of all thy stumbling.

That which thou hast to transcend is the self that thou appearest to be, and that is man as thou knowest him, the apparent Purusha. And what is this man? He is a mental being enslaved to life and matter; and where he is not enslaved to life and
matter, he is the slave of his mind. But this is a great and heavy
servitude; for to be the slave of mind is to be the slave of the false,
the limited and the apparent. The self that thou hast to become,
is the self that thou art within behind the veil of mind and life
and matter. It is to be the spiritual, the divine, the superman, the
real Purusha. For that which is above the mental being, is the
superman. It is to be the master of thy mind, thy life and thy
body; it is to be a king over Nature of whom thou art now the
tool, lifted above her who now has thee under her feet. It is to be
free and not a slave, to be one and not divided, to be immortal
and not obscured by death, to be full of light and not darkened,
to be full of bliss and not the sport of grief and suffering, to be
uplifted into power and not cast down into weakness. It is to
live in the Infinite and possess the finite. It is to live in God and
be one with him in his being. To become thyself is to be this and
all that flows from it.

Be free in thyself, and therefore free in thy mind, free in thy
life and thy body. For the Spirit is freedom.

Be one with God and all beings; live in thyself and not in
thy little ego. For the Spirit is unity.

Be thyself, immortal, and put not thy faith in death; for
death is not of thyself, but of thy body. For the Spirit is immor-
tality.

To be immortal is to be infinite in being and consciousness
and bliss; for the Spirit is infinite and that which is finite lives
only by his infinity.

These things thou art, therefore thou canst become all this;
but if thou wert not these things, then thou couldst never become
them. What is within thee, that alone can be revealed in thy be-
ing. Thou appearest indeed to be other than this, but wherefore
shouldst thou enslave thyself to appearances?

Rather arise, transcend thyself, become thyself. Thou art
man and the whole nature of man is to become more than
himself. He was the man-animal, he has become more than the
animal man. He is the thinker, the craftsman, the seeker after
beauty. He shall be more than the thinker, he shall be the seer
of knowledge; he shall be more than the craftsman, he shall be
the creator and master of his creation; he shall be more than the seeker of beauty, for he shall enjoy all beauty and all delight. Physical, he seeks for his immortal substance; vital he seeks after immortal life and the infinite power of his being; mental and partial in knowledge, he seeks after the whole light and the utter vision.

To possess these is to become the superman; for [it] is to rise out of mind into the supermind. Call it the divine mind or Knowledge or the supermind; it is the power and light of the divine will and the divine consciousness. By the supermind the Spirit saw and created himself in the worlds, by that he lives in them and governs them. By that he is Swarat Samrat, self-ruler and all-ruler.

Supermind is superman; therefore to rise beyond mind is the condition.

To be the superman is to live the divine life, to be a god; for the gods are the powers of God. Be a power of God in humanity.

To live in the divine Being and let the consciousness and bliss, the will and knowledge of the Spirit possess thee and play with thee and through thee, this is the meaning.

This is the transfiguration of thyself on the mountain. It is to discover God in thyself and reveal him to thyself in all things. Live in his being, shine with his light, act with his power, rejoice with his bliss. Be that Fire and that Sun and that Ocean. Be that joy and that greatness and that beauty.

When thou hast done this even in part, thou hast attained to the first steps of supermanhood.
Section Five

1927 and after
The Law of the Way

First be sure of the call and of thy soul’s answer. For if the call is not true, not the touch of God’s powers or the voice of his messengers, but the lure of thy ego, the end of thy endeavour will be a poor spiritual fiasco or else a deep disaster.

And if not the soul’s fervour, but only the mind’s assent or interest replies to the divine summons or only the lower life’s desire clutches at some side attraction of the fruits of Yoga-power or Yoga-pleasure or only a transient emotion leaps like an unsteady flame moved by the intensity of the Voice or its sweetness or grandeur, then too there can be little surety for thee in the difficult path of Yoga.

The outer instruments of mortal man have no force to carry him through the severe ardours of this spiritual journey and Titanic inner battle or to meet its terrible or obstinate ordeals or nerve him to face and overcome its subtle and formidable dangers. Only his spirit’s august and steadfast will and the quenchless fire of his soul’s invincible ardour are sufficient for this difficult transformation and this high improbable endeavour.

Imagine not the way is easy; the way is long, arduous, dangerous, difficult. At every step is an ambush, at every turn a pitfall. A thousand seen or unseen enemies will start up against thee, terrible in subtlety against thy ignorance, formidable in power against thy weakness. And when with pain thou hast destroyed them, other thousands will surge up to take their place. Hell will vomit its hordes to oppose thee and enring and wound and menace; Heaven will meet thee with its pitiless tests and its cold luminous denials. Thou shalt find thyself alone in thy anguish, the demons furious in thy path, the Gods unwilling above thee. Ancient and powerful, cruel, unvanquished and close and innumerable are the dark and dreadful Powers that profit by the reign of Night and Ignorance and would have no
change and are hostile. Aloof, slow to arrive, far-off and few and brief in their visits are the Bright Ones who are willing or permitted to succour. Each step forward is a battle. There are precipitous descents, there are unending ascensions and ever higher peaks upon peaks to conquer. Each plateau climbed is but a stage on the way and reveals endless heights beyond it. Each victory thou thinkest the last triumphant struggle proves to be but the prelude to a hundred fierce and perilous battles... But thou sayest God’s hand will be with me and the Divine Mother near with her gracious smile of succour? And thou knowest not then that God’s grace is more difficult to have or to keep than the nectar of the Immortals or Kuvera’s priceless treasures? Ask of His chosen and they will tell thee how often the Eternal has covered his face from them, how often he has withdrawn from them behind his mysterious veil and they have found themselves alone in the grip of Hell, solitary in the horror of the darkness, naked and defenceless in the anguish of the battle. And if his presence is felt behind the veil, yet is it like the winter sun behind clouds and saves not from the rain and snow and the calamitous storm and the harsh wind and the bitter cold and the grey of a sorrowful atmosphere and the dun weary dullness. Doubtless the help is there even when it seems to be withdrawn, but still is there the appearance of total night with no sun to come and no star of hope to pierce the blackness. Beautiful is the face of the Divine Mother, but she too can be hard and terrible. Nay, then, is immortality a plaything to be given lightly to a child or the divine life a prize without effort or the crown for a weakling? Strive rightly and thou shalt have; trust and thy trust shall in the end be justified; but the dread Law of the Way is there and none can abrogate it.
Man and the Supermind

Man is a transitional being, he is not final; for in him and high beyond him ascend the radiant degrees which climb to a divine supermanhood.

The step from man towards superman is the next approaching achievement in the earth’s evolution. There lies our destiny and the liberating key to our aspiring, but troubled and limited human existence — inevitable because it is at once the intention of the inner Spirit and the logic of Nature’s process.

The appearance of a human possibility in a material and animal world was the first glint of a coming divine Light, — the first far-off intimation of a godhead to be born out of Matter. The appearance of the superman in the human world will be the fulfilment of that distant shining promise.

The difference between man and superman will be the difference between mind and a consciousness as far beyond it as thinking mind is beyond the consciousness of plant and animal; the differentiating essence of man is mind, the differentiating essence of superman will be supermind or a divine gnosis.

Man is a mind imprisoned, obscured and circumscribed in a precarious and imperfect living but imperfectly conscious body. The superman will be a supramental spirit which will envelop and freely use a conscious body, plastic to spiritual forces. His physical frame will be a firm support and an adequate radiant instrument for the spirit’s divine play and work in Matter.

Mind, even free and in its own unmixed and unhampered element, is not the highest possibility of consciousness; for mind is not in possession of Truth, but only a minor vessel or an instrument and here an ignorant seeker plucking eagerly at a mass of falsehoods and half-truths for the unsatisfying pabulum of its hunger. Beyond mind is a supramental or gnostic power of consciousness that is in eternal possession of Truth; all its motion
and feeling and sense and outcome are instinct and luminous with the inmost reality of things and express nothing else.

Supermind or gnosis is in its original nature at once and in the same movement an infinite wisdom and an infinite will. At its source it is the dynamic consciousness of the divine Knower and Creator.

When in the process of unfolding of an always greater force of the one Existence, some delegation of this power shall descend into our limited human nature, then and then only can man exceed himself and know divinely and divinely act and create; he will have become at last a conscious portion of the Eternal. The superman will be born, not a magnified mental being, but a supramental power descended here into a new life of the transformed terrestrial body. A gnostic supermanhood is the next distinct and triumphant victory to be won by the spirit descended into earthly nature.

The disk of a secret sun of Power and Joy and Knowledge is emerging out of the material consciousness in which our mind works as a chained slave or a baffled and impotent demiurge; supermind will be the formed body of that radiant effulgence.

Superman is not man climbed to his own natural zenith, not a superior degree of human greatness, knowledge, power, intelligence, will, character, genius, dynamic force, saintliness, love, purity or perfection. Supermind is something beyond mental man and his limits, a greater consciousness than the highest consciousness proper to human nature.

Man is a being from the mental worlds whose mentality works here involved, obscure and degraded in a physical brain, shut off from its own divinest powers and impotent to change life beyond certain narrow and precarious limits. Even in the highest of his kind it is baulked of its luminous possibilities of supreme force and freedom by this dependence. Most often and in most men it is only a servitor, a purveyor of amusements, a caterer of needs and interests to the life and the body. But the superman will be a gnostic king of Nature; supermind in him even in its evolutionary beginnings will appear as a ray of the eternal omniscience and omnipotence. Sovereign and irresistible
it will lay hands on the mental and physical instruments, and, standing above and yet penetrating and possessing our lower already manifested parts, it will transform mind, life and body into its own divine and luminous nature.

Man in himself is hardly better than an ambitious nothing. He is a narrowness that reaches towards ungrasped widenesses, a littleness straining towards grandeurs which are beyond him, a dwarf enamoured of the heights. His mind is a darkened ray in the splendidours of the universal Mind. His life is a striving exulting and suffering wave, an eager passion-tossed and sorrow-stricken or a blindly and dully toiling petty moment of the universal Life. His body is a labouring perishable speck in the material universe. An immortal soul is somewhere hidden within him and gives out from time to time some sparks of its presence, and an eternal spirit is above and overshadows with its wings and upholds with its power this soul continuity in his nature. But that greater spirit is obstructed from descent by the hard lid of his constructed personality and this inner radiant soul is wrapped, stifled and oppressed in dense outer coatings. In all but a few it is seldom active, in many hardly perceptible. The soul and spirit in man seem rather to exist above and behind his formed nature than to be a part of its visible reality; subliminal in his inner being or superconscient above in some unreached status, they are in his outer consciousness possibilities rather than things realised and present. The spirit is in course of birth rather than born in Matter.

This imperfect being with his hampered, confused, ill-ordered and mostly ineffective consciousness cannot be the end and highest height of the mysterious upward surge of Nature. There is something more that has yet to be brought down from above and is now seen only by broken glimpses through sudden rifts in the giant wall of our limitations. Or else there is something yet to be evolved from below, sleeping under the veil of man’s mental consciousness or half visible by flashes, as life once slept in the stone and metal, mind in the plant and reason in the cave of animal memory underlying its imperfect apparatus of emotion and sense-device and instinct. Something
there is in us yet unexpressed that has to be delivered by an enveloping illumination from above. A godhead is imprisoned in our depths, one in its being with a greater godhead ready to descend from superhuman summits. In that descent and awakened joining is the secret of our future.

Man’s greatness is not in what he is but in what he makes possible. His glory is that he is the closed place and secret workshop of a living labour in which supermanhood is made ready by a divine Craftsman.

But he is admitted to a yet greater greatness and it is this that, unlike the lower creation, he is allowed to be partly the conscious artisan of his divine change. His free assent, his consecrated will and participation are needed that into his body may descend the glory that will replace him. His aspiration is earth’s call to the supramental Creator.

If earth calls and the Supreme answers, the hour can be even now for that immense and glorious transformation.
The Involved and Evolving Godhead

The involution of a superconscient Spirit in inconscient Matter is the secret cause of this visible and apparent world. The key-word of the earth’s riddle is the gradual evolution of a hidden illimitable consciousness and power out of the seemingly inert yet furiously driven force of insensible Nature. Earth-life is one self-chosen habitation of a great Divinity and his aeonic will is to change it from a blind prison into his splendid mansion and high heaven-reaching temple.

The nature of the Divinity in the world is an enigma to the mind, but to our enlarging consciousness it will appear as a presence simple and inevitable. Freed we shall enter into the immutable stability of an eternal existence that puts on this revealing multitude of significant mutable forms. Illumined we shall become aware of the indivisible light of an infinite consciousness that breaks out here into multiform grouping and detail of knowledge. Sublimated in might, we shall share the illimitable movement of an omnipotent force that works out its marvels in self-imposed limits. Fixed in griefless bliss we shall possess the calm and ecstasy of an immeasurable Delight that creates for ever the multitudinous waves and rhythms and the ever increasing outward-going and inward-drawing intensities of its own creative and communicative world-possessing and self-possessing bliss. This, since we are inwardly souls of that Spirit, will be the nature of our fourfold experience when the evolving Godhead will work here in its own unveiled movement.

If that full manifestation had been from the beginning, there would be no terrestrial problem, no anguish of growth, no baffled seeking out of mind and will and life and body towards knowledge and force and joy and an immortal persistence. But this Godhead, whether within us or outside in things and forces and creatures, started from an involution in inconscience of
Nature and began by the manifestation of its apparent opposites. Out of a vast cosmic inconscience and inertia and insensibility, an initial disguise that is almost non-existence, the Spirit in Matter has chosen to evolve and slowly shape, as if in a grudging and gradually yielding material, its might and light and infinity and beatitude.

The significance of the terrestrial evolution lies in this slow and progressive liberation of some latent indwelling Spirit. The heart of its mystery is the difficult appearance, the tardy becoming of a divine Something or Someone already involved in physical Nature. The Spirit is there with all its potential forces in a first formal basis of its own supporting, yet resistant substance. Its greater subsequent and deliberately emerging movements, life and mind and intuition and soul and supermind and the light of the Godhead are already there, locked up and obscurely compressed into the initial power and first expressive values of Matter.

Before there could be any evolution, there must needs be this involution of the Divine All that is to emerge. Otherwise there would have been not an ordered and significant evolution, but a successive creation of things unforeseeable, not contained in their antecedents, not their inevitable consequences or right followers in sequence.

This world is not an apparent order fortuitously managed by an inexplicable Chance. Neither is it a marvellous mechanism miraculously contrived by a stumblingly fortunate unconscious Force or mechanical Necessity. It is not even a structure built according to his fancy or will by an external and therefore necessarily a limited Creator. Mentally conceivable, each of these solutions can explain one side or appearance of things; but it is a greater truth that can alone successfully join all the aspects and illumine all the facts of the enigma.

If all were indeed a result of cosmic Chance, there would be no necessity of a new advance; nothing beyond mind need appear in the material world,—as indeed there was then no necessity for even mind to arise at all out of the meaningless blind material whirl. Consciousness itself would be only a
fortuitous apparition, a strange hallucinating reflection or ghost of Matter.

Or if all were the work of a mechanical Force, then too mind need not have appeared at all as part of the huge grinding engine; there was no indispensable call for this subtler and yet less competent groping mechanic contrivance. No frail thinking brain should have been there to labour over the quite sufficient cogs and springs and pistons of the first unerring machine. A supermind added on this brilliant and painful complication would be still more a superfluous and a luminous insolence; it could be nothing more than a false pretension of transitory consciousness to govern and possess the greater inconscient Force that is its creator.

Or if an experimenting, external and therefore limited Creator were the inventor of the animal's suffering life and man's fumbling mind and this huge mainly unused and useless universe, there was no reason why he should not have stopped short with the construction of a mental intelligence in his creatures, content with the difficult ingenuity of his labour. Even if he were all-powerful and all-wise, he might well pause there, — for if he went farther, the creature would be in danger of rising too near to the level of his Maker.

But if this is the truth of things that an infinite Spirit, an eternal Divine Presence and Consciousness and Force and Bliss is involved and hidden here and slowly emerges, then is it inevitable that its powers or the ascending degrees of its one power should emerge too one after the other till the whole glory is manifested, a mighty divine Fact embodied and dynamic and visible.

All mental ideas of the nature of things, are inconclusive considerations of our insufficient logical reason when it attempts in its limited light and ignorant self-sufficiency to weigh the logical probabilities of a universal order which after all its speculation and discovery must remain obscure to it still and an enigma. The true witness and discoverer is our growing consciousness; for that consciousness is itself the sign and power of the evolving Divine, and its growth out of the apparent inconscience
of the material universe is the fundamental, the one abiding, progressive index event of the long earth-story.

Only when this evolving consciousness can grow into its own full divine power will we directly know ourselves and the world instead of catching at tags and tail ends of an insufficent figure of knowledge. This full power of the consciousness is supermind or gnosis, — supermind because to reach it we have to pass beyond and turn upon mind as the mind itself has passed and turned upon life and inconscient matter and gnosis because it is eternally self-possessed of Truth and in its very stuff and nature it is dynamic substance of knowledge.

The true knowledge of things is denied to our reason, because that is not our spirit’s greatest essential power but only an expedient, a transitional instrument meant to deal with the appearance of things and their phenomenal process. True knowledge commences only when our consciousness can pass beyond its present normal limit in man: for then it becomes directly aware of its self and of the Power in the world and begins to have at least an initial knowledge by identity which is the sole true knowledge. Henceforward it knows and sees, no longer by the reason groping among external data, but by an ever increasing and always more luminous self-illumining and all illuminating experience. In the end it will become a conscious part of the Divine revealing itself in the world; its life will be a power for the conscious evolution of that which is still unmanifested in the material universe.
The Evolution of Consciousness

All life here is a stage or a circumstance in an unfolding progressive evolution of a Spirit that has involved itself in Matter and is labouring to manifest itself in that reluctant substance. This is the whole secret of earthly existence.

But the key of that secret is not to be found in life itself or in the body; its hieroglyph is not in embryo or organism,—for these are only a physical means or base: the one significant mystery of this universe is the appearance and growth of consciousness in the vast mute unintelligence of Matter. The escape of Consciousness out of an apparent initial Inconscience,—but it was there all the time masked and latent, for the inconscience of Matter is itself only a hooded consciousness—its struggle to find itself, its reaching out to its own inherent completeness, perfection, joy, light, strength, mastery, harmony, freedom, this is the prolonged miracle and yet the natural and all-explaining phenomenon of which we are at once the observers and a part, instrument and vehicle.

A Consciousness, a Being, a Power, a Joy was here from the beginning darkly imprisoned in this apparent denial of itself, this original night, this obscurity and nescience of material Nature. That which is and was for ever, free, perfect, eternal and infinite, That which all is, That which we call God, Brahman, Spirit, has here shut itself up in its own self-created opposite. The Omniscient has plunged itself into Nescience, the All-Conscious into Inconscience, the All-Wise into perpetual Ignorance. The Omnipotent has formulated itself in a vast cosmic self-driven Inertia that by disintegration creates; the Infinite is self-expressed here in a boundless fragmentation; the All-Blissful has put on a huge insensibility out of which it struggles by pain and hunger and desire and sorrow. Elsewhere the Divine is; here in physical life, in this obscure material world, it would seem almost as if the Divine
Divine is not but is only becoming, θεός ουκ ἐστιν ἀλλὰ γίγνεται. This gradual becoming of the Divine out of its own phenomenal opposites is the meaning and purpose of the terrestrial evolution.

Evolution in its essence is not the development of a more and more organised body or a more and more efficient life — these are only its machinery and outward circumstance. Evolution is the strife of a Consciousness somnambulised in Matter to wake and be free and find and possess itself and all its possibilities to the very utmost and widest, to the very last and highest. Evolution is the emancipation of a self-revealing Soul secret in Form and Force, the slow becoming of a Godhead, the growth of a Spirit.

In this evolution mental man is not the goal and end, the completing value, the highest last significance; he is too small and imperfect to be the crown of all this travail of Nature. Man is not final, but a middle term only, a transitional being, an instrumental intermediate creature.

This character of evolution and this mediary position of man are not at first apparent; for to the outward eye it would seem as if evolution, the physical evolution at least were finished long ago leaving man behind as its poor best result and no new beings or superior creations were to be expected any longer. But this appears to us only so long as we look at forms and outsides only and not at the inner significances of the whole process. Matter, body, life even are the first terms necessary for the work that had to be done. New living forms may no longer be appearing freely, but this is because it is not, or at least it is not primarily, new living forms that the Force of evolution is now busied with evolving, but new powers of consciousness. When Nature, the Divine Power, had formed a body erect and empowered to think, to devise, to inquire into itself and things and work consciously both on things and self, she had what she wanted for her secret aim; relegating all else to the sphere of secondary movements, she turned toward that long-hidden aim her main highest forces. For all till then was a long strenuously slow preparation; but throughout it the development of consciousness in which the appearance of man was the crucial
This slow preparation of Nature covered immense aeons of time and infinities of space in which they appeared to be her only business; the real business strikes on our view at least when we look with the outward eye of reason as if it came only as a fortuitous accident, in or near the end, for a span of time and in a speck and hardly noticeable corner of one of the smallest provinces of a possibly minor universe among these many boundless finites, these countless universes. If it were so, we could still reply that time and space matter not to the Infinite and Eternal; it is not a waste of labour for That—as it would be for our brief death-driven existences—to work for trillions of years in order to flower only for a moment. But that paradox too is only an appearance—for the history of this single earth is not all the story of evolution—other earths there are even now elsewhere, and even here many earth-cycles came before us, and many are those that will come hereafter.

Nature laboured for innumerable millions of years to create a material universe of flaming suns and systems; for a lesser but still interminable series of millions she stooped to make this earth a habitable planet. For all that incalculable time she was or seemed busy only with the evolution of Matter; life and mind were kept secret in an apparent non-existence. But the time came when life could manifest, a vibration in the metal, a growing and seeking, a drawing in and a feeling outward in the plant, an instinctive force and sense, a nexus of joy and pain and hunger and emotion and fear and struggle in the animal,—a first organised consciousness, the beginning of the long-planned miracle. Thenceforward she was busy no more exclusively with matter for its own sake, but most with palpitant plasmic matter useful for the expression of life; the evolution of life was now her one intent purpose. And slowly too mind manifested in life, an intensely feeling, a crude thinking and planning vital mind in the animal, but in man the full organisation and apparatus, the developing if yet imperfect mental being, the Manu, the thinking, devising, aspiring, already self-conscient creature. And from
that time onward the growth of mind rather than any radical change of life became her shining preoccupation, her wonderful wager. Body appeared to evolve no more; life itself evolved little or only so much in its cycles as would serve to express Mind heightening and widening itself in the living body; an unseen internal evolution was now Nature’s great passion and purpose.

And if Mind were all that consciousness could achieve, if Mind were the secret Godhead, if there were nothing higher, larger, [no] more miraculous ranges, man could be left to fulfil mind and complete his own being and there would or need be nothing here beyond him, carrying consciousness to its summits, extending it to its unwalled vastnesses, plunging with it into depths unfathomable; he would by perfecting himself consummate Nature. Evolution would end in a Man-God, crown of the earthly cycles.

But Mind is not all; for beyond mind is a greater consciousness; there is a supermind and spirit. As Nature laboured in the animal, the vital being, till she could manifest out of him man, the Manu, the thinker, so she is labouring in man, the mental being till she can manifest out of him a spiritual and supramental godhead, the truth conscious Seer, the knower by identity, the embodied Transcendental and Universal in the individual nature.

From the clod and metal to the plant, from the plant to the animal, from the animal to man, so much has she completed of her journey; a huge stretch or a stupendous leap still remains before her. As from matter to life, from life to mind, so now she must pass from mind to supermind, from man to superman; this is the gulf that she has to bridge, the supreme miracle that she has to perform before she can rest from her struggle and discontent and stand in the radiance of that supreme consciousness, glorified, transmuted, satisfied with her labour.

The subhuman was once here supreme in her, the human replacing it walks now in the front of Time, but still, aim and goal of the future there waits the supramental, the superman, an unborn glory yet unachieved before her.
The Path

The supramental Yoga is at once an ascent towards God and a descent of Godhead into the embodied nature.

The ascent can only be achieved by a one-centred all-gathering upward aspiration of the soul and mind and life and body; the descent can only come by a call of the whole being towards the infinite and eternal Divine. If this call and this aspiration are there, or if by any means they can be born and grow constantly and seize all the nature, then and then only a supramental uplifting and transformation becomes possible.

The call and the aspiration are only first conditions; there must be along with them and brought by their effective intensity an opening of all the being to the Divine and a total surrender.

This opening is a throwing wide of all the nature on all its levels and in all its parts to receive into itself without limits the greater divine Consciousness which is there already above and behind and englobing this mortal half-conscious existence. In the receiving there must be no inability to contain, no breaking down of anything in the system, mind or life or nerve or body under the transmuting stress. There must be an endless receptivity, an always increasing capacity to bear an ever stronger and more and more insistent action of the divine Force. Otherwise nothing great and permanent can be done; the Yoga will end in a break-down or an inert stoppage or a stultifying or a disastrous arrest in a process which must be absolute and integral if it is not to be a failure.

But since no human system has this endless receptivity and unfailing capacity, the supramental Yoga can succeed only if the Divine Force as it descends increases the personal power and equates the strength that receives with the Force that enters from above to work in the nature. This is only possible if there is on our part a progressive surrender of the being into the hands
of the Divine; there must be a complete and never failing assent, a courageous willingness to let the Divine Power do with us whatever is needed for the work that has to be done.

Man cannot by his own effort make himself more than man; the mental being cannot by his own unaided force change himself into a supramental spirit. A descent of the Divine Nature can alone divinise the human receptacle.

For the powers of our mind, life and body are bound to their own limitations and, however high they may rise or however widely expand, they cannot rise above their natural ultimate limits or expand beyond them. But, still, mental man can open to what is beyond him and call down a supramental Light, Truth and Power to work in him and do what the mind cannot do. If mind cannot by effort become what is beyond mind, supermind can descend and transform mind into its own substance.

If the supramental Power is allowed by man’s discerning assent and vigilant surrender to act according to its own profound and subtle insight and flexible potency, it will bring about slowly or swiftly a divine transformation of our present semiperfect nature.

This descent, this working is not without its possibility of calamitous fall and danger. If the human mind or the vital desire seizes hold on the descending force and tries to use it according to its own limited and erring ideas or flawed and egoistic impulses, — and this is inevitable in some degree until this lower mortal has learned something of the way of that greater immortal nature, — stumblings and deviations, hard and seemingly insuperable obstacles and wounds and suffering cannot be escaped and even death or utter downfall are not impossible. Only when the conscious integral surrender to the Divine has been learned by mind and life and body, can the way of the Yoga become easy, straight, swift and safe.

And it must be a surrender and an opening to the Divine alone and to no other. For it is possible for an obscure mind or an impure life force in us to surrender to undivine and hostile forces and even to mistake them for the Divine. There can be no more calamitous error. Therefore our surrender must be no
blind and inert passivity to all influences or any influence, but sincere, conscious, vigilant, pointed to the One and the Highest alone.

Self-surrender to the divine and infinite Mother, however difficult, remains our only effective means and our sole abiding refuge. Self-surrender to her means that our nature must be an instrument in her hands, the soul a child in the arms of the Mother.
Part Two

From Man to Superman

Notes and Fragments on Philosophy,

Psychology and Yoga

1912–1947

The notes, drafts and fragments collected in this part were not written by Sri Aurobindo in the present sequence nor intended by him to form a single work. They have been arranged by the editors by topic in three sections—Philosophy: God, Nature and Man; Psychology: The Science of Consciousness; Yoga: Change of Consciousness and Transformation of Nature.
Section One

Philosophy

God, Nature and Man
God
The One Reality

The Divine Eternal and Infinite

There are three Powers with whom we have to reckon, three and no others; for no others are in the universe or out of the universe: God, the Soul and Nature. And these three are, as it were, different fronts of One Being.

All existence, whatever its appearance or its process of being, is and draws its substance, origin, energy, truth from a Spirit which is the beginning, middle and end of all — itself being eternal, infinite, self-existent beyond end or beginning, beyond Space and Time, beyond Form and Quality and Circumstance as well as in Space and Time, in Form and Quality and Circumstance. This is the fundamental Reality which is hidden from our knowledge, the one Truth on which all other truths depend, those that affirm it as well as those that seem to contradict it. To be conscious of this Reality and its right relations with the other truths or appearances of existence, to live in it and govern by its Truth all our being, consciousness, nature, will, action would then be the law of a perfect life. If human life is imperfect, it is because its consciousness moves seeking, groping, experimenting in a fundamental ignorance of the real truth of its own being and is therefore unable to know or to effectuate the true law of its life. It is only if man can overcome this ignorance and inability that he can hope to perfect his life and nature. If there is no means of doing that, then he can never hope to escape from his
imperfection—and the suffering which is its consequence. He can only either die in his ignorance escaping from an incurable imperfection and suffering by a physical extinction or escape out of it by a spiritual extinction gained through an awakening of the soul to the illusoriness of birth and world and Nature or [ . . . ] & hope to get [out] of it into some other supraterrestrial state of existence. Human life on earth can then never grow into anything fundamentally other, better or more perfect than it is now. The hope that by using our reason and observing or utilising the laws of Nature we can arrive at a perfect life here is futile, for our nature here being itself ignorant and imperfect cannot arrive at anything better than a mitigated imperfection and ignorance. But if there is a means by which we can arrive at a true knowledge of the reality behind things and enter into its Truth and Light and Power then there is no reason why our life here should not become divine and perfect. It is through Yoga that this means can be found and this emergence become possible.

A greater existence and consciousness than what we are now or are in our surface being, to which yet we can by certain means raise ourself and become or enter into that,—this is the postulate of all Yoga.

What is this greater consciousness and existence? It is something or someone eternal and infinite, absolute or perfect, in which all is, from which all comes, to which all returns and which is the secret self of all things. All is by its existence, all is conscious by its consciousness, continues to be by its Ananda of being, thinks by its Mind, lives by its life, is a form of its Energy in the Cosmos. But still the existence we live, the consciousness we use, the highest joy of being which we experience, our mind, life, body, force are but a fragmentary phenomenon of or in It. That Eternal is the All, the whole, our greater Self, our completeness, our universe, yet is it more than any universe. If no universe were, it still would be.

This Eternal and Infinite is not only an Eternal of endless Time and Space. For its eternity can be realised not only in
the endless progression of the years and aeons but in a single
moment of Time, its infinity not only in the boundless extension
of space to which we can assign no end or border, but in the
most infinitesimal atom of an atom. But beyond the moment
and the endless aeons the eternity of the Eternal is timeless and
beyond the spatial Infinite and Infinitesimal the infinity of the
Infinite is spaceless.

4

All begins from the Divine, from the Eternal, from the Infinite,
al abides in it alone and by it alone, all ends or culminates
in the divine Eternal and Infinite. This is the first postulate
indispensable for our spiritual seeking — for on no other base
can we found the highest knowledge and the highest life.

All time moves in the Eternal; all space is spread in the
Infinite; all creatures and creations live by that in them which is
Divine. This is patently true of an inner spiritual but also proves
in the end to be true of this outer space and time. It is known
to our inmost being that it lives because it is part of the Divine,
but it is true also of the external and phenomenal creature com-
pounded of ignorant Mind, blind life and subconscious Matter.

A secret Self is the Alpha and Omega of this manifested
existence; it is also the constant term, the omnipresent x into
which all things resolve separately or together and which is their
sum, their constituting material and their essence. All here is
secretly the Divine, all is the Eternal, all is the Infinite.

But this secret truth of things is contradicted by the world’s
external appearances, it is denied by all the facts placed before
us by our mind and senses, inconsistent with the sorrow and
suffering of the world, incompatible with the imperfection of
living beings and the unchangeable insconcience of things. What
then pushes the mind to affirm it? what compels us to admit a
seeing of things which is in conflict with our outer seeing and
experience?

For on the surface of our consciousness and all around us
there is only the temporal and transient, only [the] confined and
finite. What seems largest to us finds its limit, what we dreamed
to be enduring comes to an end; even this vast universe with its masses of worlds upon worlds which seemed to stretch into infinity is convicted in the end of being only a boundless finite. Man claiming to be a divine soul and an all-discovering intellect is brought up short by Nature's rude proof of his ignorance and incompetence and exhibits constantly in his thoughts the proneness to self-confident error and in his feelings and acts the petty faultiness, meanness, and darkness or suddenly the abysses of falsehood or foulness or cruelty of his nature. In the management of his world the much that is undivine prevails easily over the little that is divine or they are inextricably mixed together. The ideal fails in practice, religion degenerates quickly into a settled sectarian fanaticism or formality, the triumphant good turns into an organised evil. The Christian doctrine of the fall, the Indian idea of the wandering of the Soul in a cosmic illusion or the sceptic affirmation of an inconscient material Nature producing the freak of consciousness seems often to be the kernel of the whole matter.

And yet if we go deep enough into ourselves, we strike against something valid that proves to be a veiled divine element which affirms its immortality, Soul. If we go beyond our embodied mind and senses we break suddenly into something permanent that feels itself to be eternal and infinite, that cannot see itself as anything else and we also cannot conceive of it as anything else, an infinite Self, an eternal Spirit. Moreover in our most secret essence we are convinced of perfection or of perfectibility — perfection in our deepest spiritual being, perfectibility in our nature; we have the instinct and intuition of the Divine.

Even to Time and Space our mind cannot fix or conceive a beginning or an end; it cannot conceive a first bound or a last, a primary or ultimate moment without at once looking beyond it. If we see the imperfection of things, the very idea implies a potentiality of a perfection by comparison with which they are imperfect, and this potentiality points to a beyond Mind and beyond Sense which is the integrally and permanently perfect. Every relative supposes an absolute.

For a long time we have been asked not to believe in these
things, to put our trust only in the measuring rods of science and its calculations and crucibles, to accept only what is materially ascertainable and measurable. But these measurements are those of something that is limited — how can we ascertain by it whether there is or is not the Illimitable? The instruments by which we question Nature in order to find out what is ascertainable have been proved to give only the results which are already contained in the question or in the questioner. Science gives us the measures and process of things within the physical limit, but it has failed to tell us what things are, their final origin or their reason of existence.

In all this questing by one end or the other we cannot get beyond ourselves and it is better then to look into the inner side of ourselves, — why should we limit ourselves only to our responses to an outer evidence? Let us explore ourselves and not only our sense or perception of what is around us. And in ourselves let us look not only at our surfaces but at the inner and the inmost of our being and nature.

This self-knowledge pursued far enough shows us a deeper than the surface mind and a deeper than the physical sense, a profounder than the outward life. It shows us also a Beyond-Mind and Beyond-Sense, a Beyond-Life; the limited passes into [the] illimitable. If there were not this capacity of research, we would have to be content with an unsatisfied agnosticism; but the means is there by which we can know ourselves and this Alpha and X and Omega of things or if not absolutely It at any rate its status and its dynamis, the law of its being and the law of its nature quite as deeply and more deeply than Science can show us the law and process of the physical universe.

For the moment let us affirm only this result that this spiritual search and knowledge leads us beyond the phenomenon which apparently contradicts it to that which beyond the phenomenon brings us to the Divine Eternal and Infinite.

The rooted and fundamental conception of Vedanta is that there exists somewhere, could we but find it, available to experience
or self-revelation, if denied to intellectual research, a single truth comprehensive & universal in the light of which the whole of existence would stand revealed and explained both in its nature and its end. This universal existence, for all its multitude of objects and its diversity of faces, is one in substance and origin; and there is an unknown quantity, X or Brahman to which it can be reduced, for from that it started and in & by that it still exists.

6

Brahman is that which was before the beginning and will be after the end of things. In the beginning, says the Upanishad, Self was, Being was or Non-Being was; that saw world-creation in itself or from that Non-Being or eternal Being temporal existence was born. What prevents the timeless Eternal from conceiving Time in himself and ceasing from the conception? But the very idea supposes time[.]

7

One says “In the beginning was the Self, the Spirit, God, the Eternal.” But there was never a beginning, for the Eternal and its works are always and for ever.

“In the beginning” is a phrase that has no meaning unless we speak of sections of existence, sections of it in Time, sections of it in Space, sections of it in substance; for these have a beginning and an end. Existence in itself has no end even as it never had a beginning.

It is not of pure existence only that this [can be said], existence in its essence without any expressive motion or feature, but of existence with all it contains and reveals in its depths as on its surface. For pure existence is only a state of being and not being in its whole truth and integral significance.

And even this state, although it appears to the quiescent mind featureless, motionless, concentrated in bare uniqueness, is still not empty or without feature,—it contains enveloped in itself all truth of feature, all power of motion, all that ever was, is or shall be manifested in this or any universe.
But the supreme divine Being is beyond any distinction of pure existence and phenomenal existence, feature or no feature, form or no form, being or non-being, manifestation and the unmanifest — for these are distinctions, separate states, opposite ideas to the mind, separate experiences to the Soul on the mental level, *manomaya purusha*. But the Supreme is beyond Mind and has no need for these divisions and contradictions of its nature.

### Ekamevadvitiyam: One Without a Second

8

All existence is existence of the one Eternal and Infinite. Ekamevadvitiyam, — there is one without a second and there can be nothing else at any time or anywhere.

Even existence in Time is that, even the finite is that; for the finite is only a circumstance of the Infinite and Time is only a phase of Eternity. What we call undivine is that, for it is only a disguise of the omnipresent Divinity.

9

All existence is the existence of the one Divine Eternal and Infinite, there is and can be nothing else; not only the infinite is that but the finite, not only the timeless but Time and all that is in Time, not only the Impersonal but the Person, quality and number and that which [is] beyond quality and number; the Formless and form, the individual no less than the cosmic and supracosmic, matter and life and mind as well as the spirit, the relative and the absolute. All is that: *ekam evadvitiyam*.

All that is is reality of the Real; there is no need to invent an eternal illusive principle of Maya to account for world existence. The idea that the Supreme Reality is incapable of self-manifestation and that its only power is a power of self-delusion is a last desperate refuge of the human Mind and Reason trying to escape from a difficulty which is of its own creation, its own
self-imposed illusion or Maya and does not exist for the true and perfect supramental consciousness of the luminous Spirit.

There is no incompatibility between the Eternal and existence in Time. Time and the Timeless are the same Eternity in a self-contained status and a self-developing movement. The Timeless is eternal and knows itself in an everlasting present; Time too is eternal and is known in an indivisible movement of past, present and future. It is our consciousness poising itself in the mobile moment that gives us the impression of a divided Time, of consciousness moving from moment to moment, losing its past, gaining its future, connecting the three only by an act of memory which binds the is to the was and the to be. In the eternal Consciousness the past still exists and extends through the present into the future. To suppose that the Timeless is debarred by its timelessness from throwing itself out in a movement of Time and that Time therefore and all in time is an illusion or to suppose that Time alone exists and we are its temporal creations is to impose the ignorance and limitation of our little surface consciousness on the Divine Eternal. In reality we ourselves below our surface are the timeless developing in movement our existence in eternal Time.

One sole Reality constitutes all the infinite, the One, the Divine, the Eternal and Infinite — there is That alone and no other existence. Ekamevadvitiyam.

Infinite, but the finite existence is also that one being, that infinite Being; it has no separate reality: Eternal, but the temporal is nothing more than a movement of that Eternity, Time has no independent self-sustenance: Divine, but all that seems undivine is a disguise of the Divinity, it is no creation out of some unaccountable Opposite.

The Divine Reality is unconfined by form or quality; but form and quality also are his, infinite quality, innumerable figure, vessel of that earth, coin of that gold, colour inherent in that transcendent whiteness. All is the divine Eternal and Infinite.

Impersonal and Personal are not contrary appearances or
even dual aspects nor is the Person our convenient imagination of an ever impersonal Entity, but rather both are for ever the One.

All is the Divine, even that which is undivine. There is no not self; all this is the eternal Self; all this universe and every other universe is the Time existence of the timeless Spirit.

11

There is one sole reality and there can be no other, the One, the Divine, the Eternal and Infinite. *Ekam evadviyam brahma.*

The One is at the same time the All, for it exists in all, all exists by it, it is all. Whatever be [the] plane of being, whatever be the cosmos, whatever be the individual, the truth of its existence is the same; that it or he is the One; for there is and can be no other. The Transcendent is the Divine, the universal is the Divine, the individual is the Divine; all are the one Reality.

Not only what we see as the Infinite, but the finite also is that One Existence; it has no separate and independent reality. Not only the Eternal [is] that, but the temporal also, for the temporal is only a circumstance of the Eternal apart from which Time has no self-existence. Not only what we see as Divine is that, but the undivine is no more than a disguise of the one Divinity, it is no creation out of an unaccountable Opposite.

12

All existence is one; it is existence of the One Being, divine, infinite, eternal, absolute.

What we see as the Many, is the multiplicity of the One. All these apparently separate persons and objects are also the one existence; they are beings of the One Being. For That is their one self; in their spiritual essence they are That, even in the play and form of their being they are That; they are personalities of the one Person, they are manifestations of the one Existence, they are so many realities of the only Real. In no way are they separate and independent from It, but in every way live by It, are of It, can be nothing else. All forces are powers of the one Force,
the sole Power of the One Being; there is no other force than his. All objects are formations of the one Existence; there is nothing that exists in itself and apart from That, nothing that is of an individual essence other than the one Essence of the universe.

What we see as finite is not other than the Infinite. All is in the Infinite, all exists by the Infinite, all is of the stuff of the Infinite. No object or person could come into being or remain in being by its own finite and individual power; none exists by its own limited substance and essence other than the substance and essence of all others; all are at bottom indissolubly one. There is effective determination, definition, demarcation, diverse formation in the universe but no essential separation or division. A tree is separate as an object or phenomenon, but it is not a separate existence divided from all around it; there is a one-existence and a one-energy that has taken form of tree, constitutes every atom, molecule, fibre of it, pervades and is its whole structure of being and this existence, this energy not only abides in all of it and flows through all of it but extends everywhere around and is, constitutes, energises all other objects in the cosmos. Each finite is in fact the Infinite; all apparently separate or divided existence is only a front of the Indivisible.

All that we see as temporal is not other than the Eternal. The form of that which is in Time is or appears to be evanescent, but the self, the substance, the being that takes shape in that form is eternal and is one self, one substance, one being with all that is, all that was, all that shall be. But even the form is in itself eternal and not temporal, but it exists for ever in possibility, in power, in consciousness in the Eternal. Form is manifested and withdrawn from manifestation; it may be manifested by immediate apparition or it may be manifested by construction and withdrawn from manifestation by destruction or disaggregation, but in either case it exists beforehand in the consciousness and being of the Eternal. If it did not so preexist in power and possibility, it could not be created in actuality. For the actual proceeds from the possible and the possible is always a possibility of the truth of the Eternal.
All existence of whatever nature is existence of the One Divine, the Eternal and Infinite.

For not only the Infinite is that existence, but the finite also; not only the existence of the One, but the existence of the Many, not only the existence of the Unmanifest, but the existence of the manifested universe and of all actual or possible universes, not only the Impersonal, but the Personal, not only the Pure Existence, Consciousness, Bliss of Sachchidananda but all forms of existence or consciousness blissful or unblissful, not only the existence of the Absolute but the existence of all that is relative. There is nothing that is not the existence of the One Divine, the Eternal and Infinite. *Ekam evadvitiyam*.

There is one Being, infinite, eternal and divine, the sole Reality. All is the [], there is nothing else in the universe or outside the universe. *Ekam evadvitiyam*.

This eternity is not of Time; the eternity of Time is an extension in movement of the Timeless.

This infinity is not of Space; the infinity of Space is an extension in self of this spaceless Infinite.

All existence is the existence of the Eternal, the Infinite, the Divine, the Ineffable — existence in Time no less than existence in Eternity, existence in the finite no less than existence in the Infinite, of the Many no less than of the One, of the Personal no less than of the Impersonal, of the individual and the cosmos no less than of the supercosmic, of the relative no less than of the Absolute. *Ekam evadvitiyam Brahma*.

The Eternal is in his very truth of being Existence, Consciousness and Bliss of existence. These three are a trinity and inseparable — they are not three but one; it is only in a certain play of the Manifestation that they can be distinguished and
separated from each other or turned phenomenally into their opposites. What appears to us as Nonexistence (Asat, Nihil or Sunya) is only an existence other than the existence of which we are aware. What appears to us as Inconscience is only a veiled or involved consciousness or else a consciousness to which our mind or sense has no access. What affects us as pain or suffering is only Ananda turned against itself, a distorted and tortured Bliss of existence. These contradictions are real in the Ignorance and because of the Ignorance, but to the true consciousness they are only phenomenal and superficial, not true truths of being.

Non-Being, Being and the Absolute

Nothing can arise from Nothing. Asat, nothingness, is a creation of our mind; where it cannot see or conceive, where its object is something beyond its grasp, too much beyond to give even the sense of a vague intangible, then it cries out “Here there is nothing.” Out of its own incapacity it has created the conception of a Zero. But what in truth is this zero? It is an incalculable Infinite.

Our sense by its incapacity has invented darkness. In truth there is nothing but Light, only it is a power of light either above or below our poor human vision’s limited range.

For do not imagine that light is created by the Suns. The Suns are only physical concentrations of Light, but the splendour they concentrate for us is self-born and everywhere.

God is everywhere and wherever God is, there is Light. Jnanam chaitanyam jyotir Brahma.

* * *

Of all that we know we know only the outside; even when we imagine that we have intimately seized the innermost thing, we have touched only an inner external. It is still a sheath of the covering, only it is a second or third or even a seventh sheath, not the most outward and visible.
It is the same when we think we know God or have possession of our highest inmost Self or have entered intimately into the inmost and supreme Spirit. What we know and possess is power or some powers of God, an aspect or appearance or formulation of the Self; what we have entered into is only one wideness or one depth of the Spirit.

This is because we know and possess by the mind or even what is below the mind, and when we find ourselves most spiritual, it is the mind spiritualised that conceives of itself as spirit. Imagining that we have left mind behind us, we take it with us into its own spiritual realms and cover with it the Supramental Mystery. The result is something to us wonderful and intense; but compared with That Intensity and Wonder, it is something thin and inadequate.

All existence,—as the mind and sense know existence,—is manifestation of an Eternal and Infinite which is to the mind and sense unknowable but not unknowable to its own self-awareness.

Whatever the manifestation spiritual or material or other may be, it has behind it something that is beyond itself, and even if we reached the highest possible heights of manifested existence there would be still beyond that even an Unmanifested from which it came.

The Unmanifested Supreme is beyond all definition and description by mind or speech; no definition the mind can make, affirmative or negative, can be at all expressive of it or adequate.

To the Mind this Unmanifest can present itself as a Self, a supreme Nihil (Tao or Sunya), a featureless Absolute, an Indeterminate, a blissful Nirvana of manifested existence, a Non-Being out of which Being came or a Being of Silence out of which a world-illusion came. But all these are mental formulas expressing the mind’s approach to it, not That itself; impressions which fall from That upon the receiving consciousness, not the true essence or nature (swarupa) of the Eternal and Infinite. Even the words Eternal and Infinite are only symbolic expressions
through which the mind feels without grasping some vague impression of this Supreme.

If we say of it neti neti, this can mean nothing except that nothing in the world or beyond it of which the mind can take cognisance is the Supreme in Its entirety or Its essence. If we say of it iti iti, this can mean at the most that what we see of it in the world or beyond is some indication of something that is there beyond and by travelling through all these indications to their absolutes we may get a step or two nearer to the Absolute of all absolutes, the Supreme. Both formulas have a truth in them, but neither touches the secret truth of the Supreme.

The Origin and eternal Supporter of all existence, as of all that seems to ignorant Mind to be non-existence, is a supreme infinite and absolute. This Infinite is an essential, not, except in manifestation, a mobile temporal or extended spatial infinite; this Absolute is an expressibly positive, not a merely negating absolute — not excluding, but containing all relatives; for in it they find their own eternal and stable truth behind their present temporary and fluctuating appearance.

The Supreme is knowable to itself but unknowable to mind, inexpressible by words, because mind can grasp and words coined by the mind can express only limited, relative and divided things. Mind gets only misleading indefinite ideas of things too much beyond itself. Even here in its own field it grasps not things in themselves, but processes and phenomena, significant aspects, constructions and figures. But the Supreme is to its own absolute consciousness for ever self-known and self-aware, as also to supramental gnosis it is intimately known and knowable.

This Infinite and Eternal is the supreme Self of all, the supreme Source, Spirit and Person of all, the supreme Lord of all; there is nothing beyond it, nothing outside it. A million universes for ever persist or for ever recur because they are substantial expressions and manifestations of the supreme Infinite and Eternal.
All is existence. Non-existence is a fiction of the mind; for we describe as non-existent all that has never been within the range of our limited consciousness or is not in that range at the moment or was there once but has gone beyond it.

Being is not Parabrahman nor is Non-Being Parabrahman; these are only affirmative & negative terms in which Consciousness envisages its self-existence.

Parabrahman is beyond Knowledge because Knowledge cannot comprehend that which comprehends it & is anterior to itself.

The beginning of Wisdom is to renounce the attempt to know the Unknowable.

Nevertheless vast shadows of the Unknowable are reflected in Knowledge & to these infinities we give names, the Absolute, the Relative, Being, Non-Being, Consciousness, Force, Bliss, God, Self, the Personal, the Impersonal, Krishna, Shiva, Brahman.

Each thing in the universe is All in the Universe and also That which is beyond the universe, — what Knowledge sees of it is only the face that the All presents in some play of Its infinite consciousness. We are our own Knowledge & all that is unknown to our Knowledge.

What matters in the universe is the play of the All in Itself & its ultimate self-fulfilment in Knowledge, Bliss & Being.

There is an individual self-fulfilment, a collective, a cosmic & an extra-cosmic. We may move towards any of these ultimate affirmations, but he who accepts them all & harmonises them, is the highest human expression of Parabrahman. He is the Avatar or the divine Unit.

All being is the Eternal, the Infinite, the Divine; there is nothing beyond the Eternal and Infinite, neither is there anything else
anywhere whether in existence or in non-existence.

All being ranges between the Manifestation and the Non-Manifestation. These are the two poles of the Infinite.

The Non-Manifestation is not a Non-Existence. Non-Existence is a term created by the mind and has no absolute significance; there is no such thing as an absolute Nihil or Zero. It is agreed even by the philosophies of the Nihil, Tao or Zero (Sunya) that the Non-Existence of which they speak is a Nought in which all is and from which all comes. Tao, Nihil or Zero is not different from the Absolute or the Supreme Brahman of Vedanta; it is only another way of describing or naming it. The Supreme is an Existence beyond what we know of our existence and therefore only it can seem to our mind as a Zero, a Nihil, a Non-Existence. There is nothing there of what we know as existence, for though all is in Tao, yet all is there in a way of which our mind can have no conception or experience, therefore to the mind it has no reality and brings no concept of existence.

The manifestation in the Ignorance, that in which we live, has also been described as Asat, a non-existence, because it is not real, eternal, infinite, divine; it must therefore be an illusion, since only That exists and nothing else. But even Illusionism agrees that the manifested world is not without reality, — it is practically real, but not eternal. Moreover manifestation even if illusory in this sense, has no end or beginning in itself, but only to the soul that withdraws from it. It goes on existing eternally to other souls, it goes on existing to the Eternal. It is in the eternal consciousness that it exists, though apart from that consciousness it has no existence. Moreover the stuff of which it is made is not nothingness or void, but the Eternal itself which manifests it from itself and out of its own substance cast into form and force. It is therefore not a real Nihil, but a limited and constantly renewed, recurrent or mutable existence.

It is therefore permissible to say that all being ranges between Manifestation and Non-Manifestation, for both are degrees of existence, the one rising towards the Absolute, the other in appearance, but in appearance only, determined and relative.
All existence is Brahman, Atman & Iswara, three names for one unnameable reality which alone exists. We shall give to this sole real existence the general name of God, because we find it ultimately to be not an abstract state of Existence not conscious of itself, but a supreme & self-aware One who exists — absolutely in Himself, infinitely in the world & with an appearance of the finite in His various manifestations in the world.

God in Himself apart from all world manifestation or realisable relation to world manifestation is called the Paratpara Brahman, & is not knowable either to the knowledge that analyses or the knowledge that synthetically conceives. We can neither say of Him that He is personal or impersonal, existence or non-existence, pure or impure, Atman or unAtman. We can only say to every attempt to define Him positively or negatively, neti neti, Not this, not this. We can pass into the Paratpara Brahman, but we cannot know the Paratpara Brahman.

God in the world is Brahman-Iswara-Atman, Prakriti or Shakti and Jiva. These are the three terms of His world-manifestation.

The One and the Many are both of them eternal aspects of the Absolute Parabrahman which is Itself neither one nor many in an exclusive sense. It is beyond unity and multiplicity in its essential truth as it is beyond all other oppositions, but neither unity nor
multiplicity, neither the One nor the Many are illusions, they are
both of them truths of the Absolute, otherwise they could have
no existence nor could they come into existence. The world is
a manifestation, and in it the absolute Parabrahman manifests
as the Ishwara, the one Eternal, but also It manifests the multi-
plicity of the One in the Jiva. This creates in the manifestation
the double aspect of Being and Becoming. But becoming does
not mean that Being becomes what it never was before or that
it ceases to be its eternal self; it manifests something that is
already in its existence, a truth, a power, an aspect of itself; only
the forms are temporal and can be deformed by the Ignorance.
The Power of itself which thus manifests what is in its being is
its Shakti, Maya or Prakriti, three names for the same thing. It is
called Prakriti when it is seen in its executive aspect as working
out the manifestation for the Purusha or Ishwara.

Whether we regard the soul that manifests in a body as a portion
of the Divine, eternal therefore like the Divine, as is held by the
Gita, or the Divine himself in his aspect of multiplicity, or a sep-
rate being dependent on the Divine, as is held by the dualists, or
an illusory self-perception of the soul subject to Maya, the reality
being the Divine himself, indivisible and ever unmanifested—
one thing is certain that what appears as the Jiva is something
unborn and eternal.

24

The self which we have to perfect, is neither pure atman which
is ever perfect nor the ego which is the cause of imperfection,
but the divine self manifested in the shifting stream of Nature.

Existence is composed of Prakriti & Purusha, the consciousness
that sees and the consciousness that executes & formalises
what we see. The one we call Soul, the other Nature. These
are the first double term from which our Yoga has to start.
When we come to look in at ourselves instead of out at the
world and begin to analyse our subjective experience, we find
that there are two parts of our being which can be,
to all appearance, entirely separated from each other, one a consciousness which is still & passive and supports, and the other a consciousness which is busy, active & creative, and is supported. The passive & fundamental consciousness is the Soul, the Purusha, Witness or Sakshi; the active & superstructural consciousness is Nature, Prakriti, processive or creative energy of the Sakshi. But the two seem at first to stand apart & distinct, as if they had no share in each other.

The Purusha, still & silent witness of whatever Prakriti chooses to create, not interfering with her works, but reflecting only whatever forms, names & movements she casts on the pure mirror of his eternal existence and the Prakriti restlessly creating, acting, forming & effecting things for the delight of the Purusha, compose the double system of the Sankhyas. But as we continue analysing their relations and accumulate more and more experience of our subjective life, we find that this seeing of the Purusha is in effect a command. Whatever Prakriti perceives it to be the pleasure of the Purusha to see, she tends to preserve in his subjective experience or to establish; whatever she perceives it to be his pleasure to cease to see, she tends to renounce & abolish. Whatever he consents to in her, she forces on him & is glad of her mastery & his submission, but whenever he insists, she is bound eventually to obey. Easily found to be true in our subjective experience, this ultimate principle of things is eventually discovered by the Yogin to determine even objective phenomena. The Purusha & Prakriti are therefore not only the Witness & the Activity witnessed, but the Lord & his executive energy. The Purusha is Ishwara, the Prakriti is His shakti. Their play with each other is both the motive & the executive force of all existence in the universe.

25

The Divine is the eternal Self and Spirit; but Nature too is everlasting power of the Self, eternal conscious-Force of the Spirit.
Mind, life and Matter are powers of that Power, energies of that Force, substance of that Spirit, Spirit and Matter are not separate and contrary creations, but Matter itself is a self-creation of the Spirit.

Being and Becoming are the single One. The One does not become the Many, but the One is for ever the Many even as the Many are for ever the One.

This by a self-existent self-knowledge thou shalt know, through a supramental knowledge by identity — the problem, the opposition, the shifts of philosophy, the rifts of Science, the fragmentary upliftings of Religion are the devices of a still ignorant consciousness, a [ . . . ] seeking knowledge.

All existence is one in the Reality; manifold in its manifestation of the Reality. The Reality is the Absolute, the Spirit, the Self, the Being, the One-Existence, which is all and everywhere, but which is also more than all and nowhere. This One can be all because it is no one in particular, it can be all-pervading and eternal in its essence because it is not bound by Space or by Time. It is One but it is also multitudinous, its multitudes are the self-expression, not the denial, the abundance, not the division or fragmentation of its oneness. Each being of its multitudes seems to be a portion of the One, a finite of the Infinite, a time-face and time-form of the Eternal; but in and behind this appearance is the Reality, and there each is itself the One displaying something of itself, each is the Infinite in a finite phenomenon of itself, each is the Eternal playing in Time. But Time too is eternal, Time is eternity in extension and movement, therefore each is in its reality an eternal being of the Eternal, an infinite of the Infinite, a spirit of the One spirit, a self of the One Self. For the Reality is beyond our oppositions of one and many; its oneness and its multitude are for ever inherent in each other; yet it is bound neither by its unity nor its multiplicity, though both are true, because it is that of which both are intimate aspects, — it is the Absolute.
God is not a Being who creates & governs the universe, but the universe itself & all besides that is Timeless & Spaceless.

God is also a Being who creates the universe in Himself & governs it; for the universe is only one term of His existence. If one could conceive a centre that contains its own circle, we might have a just definition of God in the universe.

What is the Impersonality of God? It is the fact of the Is Not, the Is & the Becoming. And what is the personality of God? It is the fact that all this, the Is like the Becoming, the Is not like the Is, is aware of itself in Time & Space & beyond them.

The Impersonality of Love is a self-existent Delight which embraces, possesses & makes one in being all that manifests in Brahman. The Personality of Love is One who is aware of self-Delight & extends His Love in all creatures.

Personality & Impersonality are the same reality differently conceived by Knowledge. Ego is the consciousness of the One Infinite Personality reflected in a limiting form of consciousness & distorted by the limitation. The form itself is a face of the All which has forgotten in the succession of Time moments, in the coherence of Space-units all that is behind itself & involved in itself. Ego is a bridge by which it awakes to self-Ignorance & returns towards self-Knowledge.

If we stand on the bridge facing the world of Forms we tend towards the Relative; if we face away from them we tend towards the Absolute. It is only when we have crossed the bridge that we can easily & perfectly embrace the Relative in the Absolute.

Spirit & Matter, Pure Being & Being formally extended in Space are the two poles of the universe. In Spirit there is no ego; in substance of Matter there is no ego. In each pole ego loses itself, but in Spirit through synthesis, in Matter through dissolution.

Substance of matter, life & mind are the material which Ego uses to develop its conscious existence; there are higher infinite affirmations in which it fulfils its conscious existence.
There is a unity of essence & a unity of sum. The latter is only a synthetic formula & affirmation of multiplicity. The unity of essence is the true unity.

Unity & multiplicity are necessary to each other & one reality. Multiplicity is unity extended in its possibility; unity is multiplicity self-gathered into its essence.

The infinite Being in rest aware of its own eternal oneness. There is the everlasting silence of the Absolute.

The infinite Conscious Power in movement aware of its own eternal many-ness — the everlasting movement and creation of the Supreme.

As in the immobile ether arises, first sign of the creative impulse of Nature, vibration, Shabda, and this vibration is a line of etheric movement, is ether contacting ether in its own field of mobile self-force and that primal stir is sufficient to initiate all forms and forces, even such is the original movement of the Infinite.

But this vibration is not the stir of any material force or substance and this contact is not material contact. This is a vibration of consciousness in spiritual essence; this is the contact of consciousness with itself in spiritual substance.

This original movement, not original or first in Time, for it was from ever and continues for ever, but original in that action of consciousness which is an eternal repetition of all things in an eternal present. Or, if you will, an eternal past-present-future, the three simultaneous times of that ever packed Time of the Infinite that translates [to] our blind finite conception as the void timelessness of the Absolute.

All existence and all force proceeds from the One Supreme and all works of whatever being or whatever force are movements of the Universal and take place in the Eternal and Infinite.
The Supreme is not manifest to our minds encased in matter; numberless superphysical planes separate our terrestrial consciousness from all direct touch of our Source, and there can be no question of an unveiled immediate intimate presence and guidance of that Ineffable. And yet the Divine Consciousness and Force, the everlasting Chitshakti, the original Power, the transcendent and eternal Mother, because she holds the Supreme concealed in her, can put us into some kind of touch with that inexpressible Glory and communicate to us a highest Will and its consequence. This cannot be done through the mind; for the thinking mind can only form some inadequate and quite abstract conception of an Absolute or a supreme Person or an impersonal Principle or Presence. And even the higher mind that experiences returns only a pale reflection of Sachchidananda which it takes for that Ineffable or a vague sense of the Eternal or the Infinite. It cannot lay hold upon That and it cannot enter, for if it tries, either that vanishes from it or itself it disappears in a featureless trance, extinction, annihilation, void or dissolution, nirvikalpa samadhi, nirvana, vinash, shunya, laya. But what the mind cannot do, the soul and a great secret Overmind can.

To the earth-mind God does not exist or is only a mental idea, an emotional or the Life-mind’s projection and self-image.

Chitshakti not mind has created the world. Chitshakti is the thing which the Scientists call in its various aspects Force & Energy, but it is no material Force or Energy, it is the divine power of self-conscious Being forming itself not materially, not in substance of matter but in the substance of that self-consciousness into these images of form and force which make up the world. What we call world, is a harmony of things seen not by the individual mind or even by universal mind, but rather seen through universal mind, as through a reflecting medium, by the Eye of divine Being. The eye that sees is immaterial, the things seen are
immaterial; for matter itself is only a form, image & appearance of eternal Spirit.

31

How, it is asked, do we make a permanent and changeless world out of a world of changing and transient objects? But this is to create a problem where there is none. We do nothing of the kind; what we do is to perceive by the senses a world of stability in constant motion, of sameness in spite of change. It is the world that is like that; we do not make it so; our senses receive, they do not create; if there is an error in their perceptions or images it is a passive imperfection of sensing that causes the wrong or altered image, it is not a willed and dynamic change like the liberties the artist takes with Nature.

Men are always changing, but man has a permanent character which does not alter. Tigers differ from each other and from themselves in the process of time, but the tiger is always the same animal and always as such recognisable. It is the details that vary and change, the type, the fundamental pattern is constant. So far our senses and our mind standing upon their data do not betray or deceive us. If they see a world that is stable and the same in spite of constant mobility and mutation, it is because the world is like that and it is therefore that we have to see it so and cannot see it otherwise. If there is a problem it is not what we make of it, not a problem of our psychology but why it is so, what is behind the mobility of the world and its stability, what is the cause or the significance or reality of it. There is no doubt the problem of what are mind and sense and their nature, their reality, their relation to the world and its cause or significance; but that too is a problem of metaphysics.

Are there then two worlds, the one changing and existing in time, the other changeless and eternal? Or are there rather two ways of knowing one and the same world? These questions, as they are put, are meaningless; for it is obvious that it is one world we are seeing and not two and that objects here belong to the same universe and not to two different universes at the
same time. It cannot be the truth that man belongs to one world and men in their mutability to another or that in seeing the changes and variations of the species tiger we are seeing the world in one way and when we see the persistence of type of the species we are knowing it in a different way. These artificial problems are the result of looking at words and concepts instead of things; we concentrate on the words and concepts “sameness” and “change”, see that they represent as abstractions ideas that stand opposed to each other, imagine that they are as opposed in fact as in our minds, are incompatible and therefore cannot coexist in the same world or cannot be true at the same time or in the same world-perception. As a matter of fact there is no such incompatibility; something that is permanently the same may be in constant change of its details of existence without losing its constant fundamental sameness. There is no reason why something should not be transient (not therefore unreal) in many of its phenomena, yet permanent in itself, in its being, whether that permanence be only a duration in time or eternal. No doubt, two worlds may meet, world of mind or spirit enter into world of Matter, but then their elements combine into one world, a world let us say of mind-informed or spirit-governed Matter; it is not two separate worlds that we are seeing at the same time and confusing together by the erroneous action of our mind and senses. Our souls, our minds may belong by origination to the mind world or spirit world, but here they are in the same world as the changing life and body and in so seeing it, we make no error.

A philosophy of change? But what is change? In ordinary parlance change means passage from one condition to another and that would seem to imply passage from one status to another status. The shoot changes into a tree, passes from the status of

---

1 These notes were written apropos of Bergson’s “philosophy of change”; “you” below would refer to a proponent of this philosophy.
shoot to the status of tree and there it stops; man passes from the status of young man to the status of old man and the only farther change possible to him is death or dissolution of his status. So it would seem that change is not something isolated which is the sole original and eternal reality, but it is something dependent on status, and if status were non-existent, change also could not exist. For we have to ask, when you speak of change as alone real, change of what, from what, to what? Without this “what” change could not be.

Change is evidently the change of some form or state of existence from one condition to another condition. Otherwise, what is it? Is it itself fundamental and absolute, not explicable or definable by any other term than itself, perceivable and intelligible as the sole reality by a naked intuition which feels and cries out “Change = reality” and then falls dumb and can say no more?

An object changes, a person changes, a condition of things changes. But can it be said that the object is no real object but only a continuity of change, or that a person is not a person but a continuity of change, a condition of things is not a condition and there are no things but there is only a continuity of change? This seems to be an illustration of the besetting sin of metaphysics — to exalt a word into a reality or an idea into a reality — without fathoming what is the reality which it tries to indicate. For to label with a word or name is not to fathom and to define, to erect a concept is not to fathom. Fathom for us then what is change before you ask us to accept it as the only reality. You may say I have fathomed it, I have seen it to be the one constant real, but do not ask me to define what it is; “listen rather in silence to the silence of Nature and you too will fathom”. But what if, so listening, I fathom other realities than change — let us say, immutable being as well as mutable force, status as well as change? To prevent that you plunge into speech and not silence, into dialectics of the intellect instead of the undeniable certitudes of intuition, and so abandon your own methodology. If intuition alone is to be used, then you must give a place to my intuition as well as yours and all, however
contradictory in appearance must stand until a greater intuition comes in to put all in their place, reconcile, include in a consistent whole.

In the world of our experience contradictories [are] often complements and necessary to each other’s existence. Change is possible only if there is a status from which to change; but status again exists only as a step that pauses, a step in the continuous passage of change or a step on which change pauses before it passes on to another step in its creative passage. And behind this relation is a duality of eternal status and eternal motion and behind this duality is something that is neither status nor change but contains both as its aspects — and That is likely to be the true Reality.

Existence, Consciousness-Force, Bliss

The nature of the Eternal is infinite Being, the nature of Being is Self-Awareness and all-Awareness or Consciousness, the nature of conscious Being is conscious Force aware of its self and its action, the nature of conscious self-awareness is infinite Bliss[.]

Identity is the first truth of existence; division is the second truth; all division is a division in oneness. There is one Existence which looks at itself from many self-divided unities observing other similar and dissimilar self-divided unities by the device of division.

Being is one; division is a device or a secondary condition of consciousness; but the primary truth of consciousness also is a truth of oneness and identity. One consciousness organised in many self-divided unities of consciousness is the subjective nature of existence.
The objective side of consciousness is force, because consciousness is a power of being. The eternal primary action of this force is to make for its own consciousness forms or figures of its being.

All force is inherently conscious force. Inhabiting and supporting every individual or universal form of being there is and must be some conscious power of being. But conscious force has the faculty of absorbing itself in its works and forms; there is in consciousness the power of self-oblivion. This self-oblivion is the primary phenomenon of material existence. But as [in] the sleeping or unconscious or self-oblivious man there is a subliminal self which neither sleeps nor forgets itself nor is unconscious, so in what appears to [be] inconscient form worked by an inconscient force or power of being there is, discoverable by extending knowledge, such a conscious power and that must be part of the conscious force of being of the one existence.

The nature of being aware of itself, in possession of all its consciousness and force is the inherent delight of its own existence. For experience shows that all complete possession of self is delight, only imperfection of possession creates imperfection or apparent absence of delight. But the one existence takes an equal delight in all the universal forms and figures of its own being, and this delight is the cause and support of universal and individual existence. For this reason all creation also and all action of force has secretly or overtly delight or a seeking for delight or [some] attraction as its first motive cause, although the apparent object or aim of the action may seem to be of a different character.

These truths do not appear entirely to us because we start from division but they become self-evident when we get to a larger consciousness open to the conscious unity underlying things or one with the one conscious existence.

The One Existence whether we call it or him God, Brahman, Purusha or by some other name is in its or his nature infinite existence aware of itself and its own eternal bliss of existence. Or speaking less in terms of division and analysis it is one existence, consciousness, bliss in an inalienable unity.
The object and condition of Life is Ananda; the means of Ananda is Tapas; the nature of Tapas is Chit; the continent and basis of Chit is Sat. It is therefore by a process of Sat developing its own Ananda through Tapas which is Chit that the Absolute appears as the extended, the eternal as the evolutionary, Brahman as the world. He who would live perfectly must know Life, he who would know Life, must know Sacchidananda.

Pleasure is not Ananda; it is a half-successful attempt to grasp at Ananda by means which ensure a relapse into pain. Therefore it is that pleasure can never be an enduring possession. It is in its nature transient and fugitive. Pain itself is obviously not Ananda; neither is it in itself anything positive, real and necessary. It has only a negative reality. It is a recoil caused by the inability to command pleasure from certain contacts which becomes habitual in our consciousness and, long ingrained in it, deludes us with the appearance of a law. We can rise above transitory pleasure; we can get rid of the possibility of pain.

Pleasure, therefore, cannot be the end & aim of life; for the true object and condition of Life is Ananda and Ananda is something in its nature one, unconditioned and infinite. If we make pleasure the object of life, then we also make pain the condition of life. The two go together and are inseparable companions. You cannot have one for your bed-fellow without making a life-companion of the other. They are husband and wife and, though perpetually quarrelling, will not hear of divorce.

But neither is pain the necessary condition of life, as the Buddhists say, nor is extinction of sensation the condition of bliss.

The world lives in and by Ananda. From Ananda, says the Veda, we were born, by Ananda we live, to Ananda we return, and it adds that no man could even have the strength to draw in his breath and throw it out again if there were not this heaven
of Bliss embracing our existence as ether embraces our bodies, nourishing us with its eternal substance and strength and supporting the life and the activity. A world which is essentially a world of bliss — this was the ancient Vedantic vision, the drishti of the Vedic drashta, which differentiates Hinduism in its early virility from the cosmic sorrow of Buddhism and the cosmic disillusionment of Mayavada. But it is possible to fall from this Bliss, not to realise it with the lower nature, in the Apara Prakriti, not to be able to grasp and possess it. Two things are necessary for the fullness of man’s bliss, — the fullness of his being and the fullness of his knowledge creating by their union the fullness of his strength in all its manifestations, viryam, balam, bhrajás, tejas, ojas. For Ananda, Sat & Chit make one reality, and Chit is in its outward working pure force to which our Rishis gave the name of Tapas. To attain even here upon earth this fullness of bliss dependent upon fullness of existence, illumination and force, must always be humanity’s drift, man’s collective endeavour. To attain it within himself here and beyond, iha ca amatra ca, must always be the drift of the human unit, the individual’s endeavour. Wherever the knowledge in him thinks it can grasp this bliss, it will fix its heaven. This is Swarga, Vaikuntha, Goloka; this is Nirvana.

The bliss of the Brahman can be described as the eternity of an uninterrupted supreme ecstasy. There is no opposition or incompatibility between these two states in the nature of the Brahman. Bliss there is the keen height and core of peace; peace there is the intimate core and essence of bliss. There is no turbidity or turbulence in the being of the Brahman; its ineffable poignancy is eternal in its self-poise.

The essential mark of the descent of the consciousness from its highest grade in the supreme spirit is the constant diminution of the power of Sachchidananda, the intensity of its force, force of being, force of consciousness, force of bliss. The intensity of all these three in the supreme status is ineffable;
in the Supermind the intensity of consciousness is ever luminous and undiminished; in overmind it is already diminished and diffuse; the highest intensity of mind is a poor thing in comparison with the splendour of overmind, and so it goes diminishing till it reaches an apparent zero which we call inconscience.

The degree and amount of pain which mind, life and body can bear is by our human standards considerable; but their capacity for pleasure is very limited and pale in its intensity, low in its degree. What we call ecstasy would seem to a god to be ridiculously thin and vapid and edgeless. Its capacity of duration also is pitifully brief and measurable by the moments.

In experience even on the spiritual plane so long as we do not transcend the spirit in mind, there is a difference between peace and Ananda. Peace is the Divine static, Ananda the Divine dynamic. Peace is a negative-positive; it is positive of itself, of status, of eternity, of the essential, of the abstract-concrete, of force in rest. It is or tends to be negative of all that is less than itself, contradictory to itself or more than itself, of the dynamic, of action, of creation, of time and happening, of the substantial concrete, of force in motion. Or when it allows these things or even feels or supports them, it is with a certain disinterested separateness. It has essentially the character of the Witness Spirit or at the most of the disinterested Witness-Creator. Ananda is in its every fibre a positive of positives. It affirms and rejoices in all that is native to peace, but it affirms too and rejoices in all that peace negates or regards with a sovereign separateness. Ananda is an all embracing and creative force. There can be in the world’s tangle of conflicting forces an Ananda of pain and suffering and in the full manifestation pain and suffering no longer remain themselves but are transformed into Ananda. But these opposing differences prove in the end to be part of the separative mental creation, the disjunctive Maya in which we live. In supermind experience peace is always full
of Ananda and by its Ananda can act and create; Ananda is for ever full of the divine peace and its most vehement ecstatic intensity contains no possibility of disturbance. At the height of the supramental Infinite peace and Ananda are one. For there status and dynamis are inseparable, rest and action affirm each other, essence and expression are one indivisible whole.

One that is Two that are Many, — this is the formula of the eternal and timeless manifestation in the worlds of Sachchidananda.

One who is Two and becomes the Two who become Many, — this is the formula of the perpetual manifestation in time in the three worlds of Mind, Life and Matter.

One who is in himself for ever the Two and for ever innumerably All and Eternal and Infinite, this is the indication of the Supreme who is beyond Time and Timelessness in the highest Absolute.

* * *

The One is Four for ever in his supramental quaternary of Being, Consciousness, Force and Ananda.

Brahma, Vishnu, Shiva, Krishna, these are the eternal Four, the quadruple Infinite.

Brahma is the Eternal’s Personality of Existence; from him all is created, by his presence, by his power, by his impulse.

Vishnu is the Eternal’s Personality of Consciousness; in him all is supported, in his wideness, in his stability, in his substance.

Shiva is the Eternal’s Personality of Force; through him all is created, through his passion, through his rhythm, through his concentration.

Krishna is the Eternal’s Personality of Ananda; because [of] him all creation is possible, because of his play, because of his delight, because of his sweetness.
Nature: The World-Manifestation

Brahma is Immortality, Vishnu is Eternity, Shiva is Infinity; Krishna is the Supreme’s eternal, infinite, immortal self-possession, self-issuing, self-manifestation, self-finding.

Manifestation, Not Illusion

40

As earth when it becomes pot, floor or oven, never ceases to be earth, so the Being even though it becomes all things and persons, is ever and immutably the same.

Becoming does not cancel Being; after millions of events in a million universes have passed in the Infinite, its infinity remains the same for ever.

The Mayavadins fix their definition, their rigid iti to the Parabrahman, the Absolute, and say that since it is that, it can never be anything else and therefore the world must be an illusion. But the Absolute is beyond all definitions, descriptions, qualifications, he is [not] bound by them, neither by features nor featurelessness, by unity nor multiplicity[.]

41

It is said by certain Adwaitists with an unusual largeness of philosophic toleration that the views of all other philosophies are true on the way or at least useful and mark stages in the realisation of the Truth, but the highest realisation is the truth of Monistic Adwaita — there is only the One and nothing else. This concession comes to nothing; for it means that other spiritual experiences are only temporarily helpful delusions or helpful half truths and the only true truth is Adwaita. The dispute remains; for all the other schools also will claim theirs as the highest truth. The mind cannot arrive at a perfect toleration, because the mind needs a cut and defined truth opposed or superior to all others. In the supermind, the aspect of the One is true like all other aspects; all are equally true but none solely true.
The position taken up by the Illusionists must first be firmly stated; for often there is a great nebulousness in the minds both of its supporters and antagonists which leaves room for much confused thinking and the real issue, the vital point gets obscured. We must first give this admission to the defence for whatever it is worth, that Illusionism does not affirm the absolute non-existence of the universe but only that it is an existence which is in its beginning and its end a non-existence and in its middle it is an existence which amounts to non-existence. It is real while it lasts to the mind that creates it; but it is not really real,—it is only phenomenally existent, like a dream, like a hallucination, like the imaginations of a person in delirium. Three questions arise from this proposition. Is this hallucinatory creation of the universe a truth or is the theory itself a hallucination of the logical mind or of the experiencing consciousness? Secondly, if true, how does the illusion come about and how is it possible? Thirdly, who is the victim of the hallucination?

The whole theory arises from and turns on one original proposition of which it is the logical consequence. It is this that Brahman the one real, original and eternal existence is, firstly, self-existent, secondly, featureless and relationless, thirdly, un-modifiable, immutable, incapable therefore of developing feature and relation, fourthly, solely existent, for there is and can be nothing else but that in existence. None of these original positions about the Brahman imposes itself irrefutably upon the intellect; there are philosophies which deny them one and all and with quite as good a show of logic as any the logical apparatus of the Mayavada can furnish us. In fact, what we first see as the one experience of our consciousness is not this at all, but just the opposite. We see that everything reduces itself not to an existence at all, but to a continuity of the action of Force, Karma as the Buddhists call it. We see that this action of Force exists only by an infinite flux of feature and relation, the stream of the Buddhist figure. Apart from that it is nothing, it is the Buddhist sunya or Nihil, and the reduction of the universe to
its original starting point, the escape out of it is not a return to
the self-existent, but a return to Nihil, a Nirvana or extinction.
Far, then, from being immutable and incapable of modification,
it is in its very nature a constant modification and mutation.
Eliminate the stream of becoming and the result is not Being,
but a zero. This is the difficulty which the Mayavada has to
surmount, the logic which it has to refute.

For it cannot be denied that the universe, the thing from
which all our conscious experience starts, is such a constant
stream of becoming, a round of mutations and modifications, a
mass of features and relations. The question is how is it main-
tained? what is [it] that gives an appearance of permanence
to the impermanent, of stability to the unstable, of a sum of
eternal sameness in which all the elements of the sum are in
constant instability and all capable of mutation? The Buddhist
admits that it is done by an action of consciousness, by idea and
association, vijnana, sanskara; but ideas and associations are
themselves Karma, action of Force, themselves impermanent,
only they create an appearance of permanence, by always acting
in the same round, creating the same combination of forms
and elements, as the flame and stream appear always the same,
though that which constitutes them is always impermanent. The
modern Materialist says that it is material Force or an eternal
Energy which takes the form of Matter and follows always
the same inherent law of action. The Mayavadin says on the
contrary that it is Consciousness, but a consciousness which is
in its reality immutable and unmodifiable self-existence, only it
produces a phenomenon of constant modification and mutation.
How is this possible? There lies the riddle, for it is a direct self-
contradiction. To escape from it, he alleges that the phenomenon
has no reality at all, but is an illusion.

To deal with this theory at all, we have first to admit that
consciousness is the cause and continent of the universe and
that it exists only in consciousness and not at all in itself. How
does he [the Mayavadin] propose to prove it? It is by an ap-
peal to reason and experience. Our reason tells us that we have
no knowledge of the existence of the universe except by our
conscious mentality, no possibility of knowing it; the universe can only be allowed to exist by a consciousness admitting its existence, supporting it by its assent. If by any chance, law or process our consciousness can cease finally to be aware of the universe, then so far as we are concerned, the universe no longer exists; it is annulled to us, it was an illusion from which we are released, as when a dream or hallucination ceases. Any such final upshot proves that originally also the universe was non-existent, for otherwise, if it had existed for us eternally without beginning, it would also continue for us eternally without end. But even if it ceases for us, it still continues in existence, is capable of being observed and lived in by others. How is that? We must suppose, that since it exists cosmically, its existence must be admitted and supported by the assent of a universal consciousness by which and for which it is or rather seems to be. Well, if by any chance, law or process this universal consciousness ceases finally to be aware of the universe, then the universe no longer exists for anybody or anything at all; it is proved to be an utter illusion, existent phenomenally only so long as the universal consciousness admitted it, but capable of coming to an end and therefore shown to be non-existent in its beginning and in its end non-existent. Now our ultimate experience is that there is a last and highest state of consciousness in which the universe does thus cease for the individual to be. What is that state? It is samadhi, a trance of consciousness in which the sole experience is thus expressed, “I am in bliss” and the sole memory brought back is “I was in bliss.” In this state the universe has for the individual no existence; he is released from it. Therefore this highest state of experience is one of which only three things can be affirmed, existence, consciousness of existence, bliss of the consciousness of existence; but it is a pure existence without other feature or any relation. But how is this proved to be the ultimate state of our conscious being? Well, it is the knowledge of the sages who have entered into it that it is the ultimate state, it is the knowledge left behind them that they have finally passed away into it not to return to consciousness of the phenomenal world, and it is confirmed by the authority of the Veda. Reason tells
us that such a condition must be the ultimate condition, since it is one infinitely beyond the phenomenal and to which the phenomenal arrives by self-elimination, and being the ultimate it must be also the original: the phenomenal which disappears from it, must originally have been imposed on it. There is no rational escaping from that conclusion.

Well, the individual soul can escape from consciousness of the universe, but what of the universal consciousness? For so long as the universe goes on existing — and who shall say that it is not for all eternity? — this escape may only prove that the individual soul goes into a state of unconsciousness or absorbed self-consciousness, like a man going to sleep or falling into a trance, while the world goes on around him just as before essentially unaffected and not at all nullified by his unconsciousness of it. But in the first place this highest power of the individual consciousness cannot be peculiar to it, for it must be a power of the general and universal; the individual reflects the universal, for it is only the law of the universal that can be repeated with individual modifications in the law of the individual. Secondly, the universal soul is the same in all; for that is the experience of the highest knowledge and consciousness, that there [is] one self in all, featureless, immutable, unmodifiable, the same amidst all the changes of phenomena. As this self can draw back that which supports the individual into it, so it is and must be capable of drawing back that which supports the universal. In one case the stream of phenomena centred around its individual reflection ceases, in the other the stream of phenomena centred around its universal reflection. A theory only? But it is justified by reason acting on our total experience which sees the lower or phenomenal and the higher or eternal and sees how the phenomenal disappears, vanishes away from the face of the eternal.

We have then as a fact a supreme state of existence which is self-existent, the original I am, which is featureless bliss and consciousness of being, immutable, eternal and this seems to be common to all beings, secret in all, the real self of all. But what then of the world? It is a mass of constant modifications of
consciousness and being, itself in its nature modification of consciousness or of being or of both. It cannot be a modification of nothing, it must be a modification of something. If consciousness and being are the first fact, real, eternal, is it not a modification of conscious being, of this real, this eternal something, and itself therefore real? Is it not itself eternal, an eternal continuity of modification, uninterrupted continual or else interrupted and recurrently continual? Must we not then suppose two states of the Brahman, a primary state of eternal unmodified being, a secondary state of eternal continuity of modifications of being, becomings of the Brahman? Does not the Vedantic statement that all comes from the Brahman, exists by it, returns to it, imply that all is eternally contained in it and all are modifications of it? In that case, we cannot say that the Eternal Being is absolutely unmodifiable. No, says the Illusionist, the supreme eternal self is not only unmodified, but unmodifiable and nothing else but the eternal unmodifiable self exists really: all else is seeming. How then do all these modifications come about? What is the clue to this mystery, the cause of this magic of illusion?

Maya, answers the Illusionist. And what is Maya? It is a power of the eternal consciousness of Brahman by which there comes about an apparent modification of consciousness of which all these modifications we call the universe are the outcome. The modification is apparent, not real, yet a fact, unreally, non-existently existent. Maya exists, yet does not exist; and its results too are apparent, not real, yet while Maya lasts, they are a fact we have to deal with, unreally, non-existently existent. We have to escape from them, by escaping from Maya. We do not understand. How can the unmodifiable consciousness undergo at all even an apparent modification, to say nothing of such portentous results of the modification? To that there is no explanation, there can be no explanation. It takes place beyond the intellect, before the intellect can at all exist and cannot be understood by the intellect; it must be accepted as a fact; it is a fact that Maya is, it is a fact that Maya can be escaped from, and therefore not being eternal, is transient, is unreal, is not. To see this and escape is our only business. Only while it lasts,
are we concerned with the modifications. But what is meant
by saying while it lasts and who is it that is subject to it and
escapes from it? Is it Brahman who is subject to Maya? No,
Brahman the eternally unmodifiable consciousness aware only
of the bliss of its self-existence cannot be subject to Maya, does
not behold this phenomenal illusion. For if he did, we returning
into that, should also behold it and could not by the returning
escape from it. It is the individual soul only that is subject to
Maya and escapes from it. But who is this individual soul? Is
it the self in the individual, the Jivatman, and is the self in the
individual different from the eternal Self? No, the individual self
is the eternal Brahman, for there is only one self and not many.
But then the Jivatman also cannot be subject to Maya or escape
from it. There is then nobody subject to it, nobody who escapes.
And really that is so, says the illusionist, but what seems to us
now to be the individual self, is a reflection of the eternal Self
in the mind, and it is that which is subject to Maya and suffers
by it. But what then is Mind? It is a result of Maya, it is an
illusory movement of consciousness, it is that for which and by
which the universe exists. Get rid of its action, its movement,
and the illusion will cease; you will be free. But then again who
is this you? If I am really the eternal, then I, the individual do
not exist; my real self, to use a desperately foolish language,
— since that means an individual in possession of a self which
cannot be, as my individuality is an illusion,— my real self is
in eternal bliss and not being affected cannot care whether this
false, nonexistently existent I is bound or escapes, suffers or is
in bliss. To whom then does it matter? Only to Maya and mind.
Well, then, it is an affair between Maya and mind, and they
can settle it between themselves. Precisely, the Illusionist will
reply; to you, the mental being, it does matter because you are
in Maya, you suffer, however phenomenally, however unreally,
and the only way to get rid of it is to abolish Maya by abolishing
yourself, your mental individuality, her result by which alone she
exists; then you will not exist, Maya and the world will exist
for other mental beings; but you will undergo extinction in the
Brahman, for you Brahman only will exist. How for me, since I
can only be either in Maya or out of it, either individually aware of Maya and not of my real self or else non-existent individually? How can ‘I’ be aware of my real self only and of nothing else? It is possible; for as the mind falsely reflects Brahman by Maya as the individual, so free from Maya, it can truly reflect Brahman and it ceases to be individual mind, although in an individual body it still seems to be individually released. Really, it is Brahman expelling Maya from the consciousness, then the mind is taken up into Samadhi, extinguished in Samadhi, and this is the [prefatory] sign. Fix your mind upon that, look at things practically, and do not ask inconsistent questions, as to how there can be individual salvation when there is no individual self to be saved. These questions do not arise once the release is made, they arise in Maya which is a practical fact and can receive only a practical solution.

Well that is a kind of answer. But how am I to know that it is not an evasion of the difficulty? What if I say that really the unmodifiable Brahman is not the highest truth? that the Brahman is aware at once of his unmodified eternal self and of his eternally modified cosmic existence, Akshara and Kshara, but he is himself beyond both, and that my real way of escape is to be the same, to be aware of my eternal self and of all the universe as modifications of my self; that with this transcendence and universality comes perfect bliss, and that the fact that I, still existing in Maya, can be blissfully aware of one Self everywhere and of all things in the universe is a proof of my assertion? This seems to me at least as good a theory as your theory of Maya; and if you say, how is that possible, I can either allege reasons or answer like you, it is a supraintellectual fact and we have to take it as a fact and find the practical way of realising it. If you want me to reject it in favour of your theory, give me at least some help. Make me realise how the world can be nonexistently existent, how the unmodifiable can be apparently modified, how I can exist only beyond the world and yet exist in it so palpably that I must struggle to get out of it, how Brahman exists only beyond Maya and yet by me exists in Maya, how mind is the result of Maya, an instrument to see world and is
yet capable of getting rid of Maya and seeing only the Brahman, how being by my individuality subject to Maya, and only able to escape by getting rid of my individuality, I am yet to become individually aware of Brahman and get an individual salvation, while all the rest of the world by which alone I am individual in my experience is still subject to it, how an unreal individual can realise Brahman.

The Mayavadin answers that as it is the Maya power of the Self which creates the ignorance in each individual, so it is the Self in each individual which enables him to have the knowledge by removing from him the Maya power. How this can be, can only be explained by analogies. As a man mistakes a rope for a snake, and then discovers it is a rope and there is no snake, so the mind thinks there is a world where there is only Brahman and discovers in the end that there is only Brahman; — or as a man mistakes mother of pearl for real pearl and runs after it and is then disillusioned and leaves it to go after the reality. As a pot is only a name and form of earth and earth is the only reality, so the world and the individual are only a name and form; break the pot, it will go back to its original earth; break the name and form in the consciousness, get rid of the individual, and there will be only Brahman in the consciousness. There are many golden ornaments, but the reality of them all is the gold; it is that alone which has value. So Brahman only is worth having; the rest is name and form and mere vanity. Or if these analogies seem to be only physical images not valid for a supraphysical fact, observe how you dream. The dream has no reality, yet is real to your consciousness while it lasts. The you in the dream is an unreal you; you awake to your real self. So the world is a dream; falling asleep to the world, the dream ceases; awake to the Brahman, the dream is convinced of unreality. That is the only possible and a quite sufficient answer.

Is it a sufficient answer? Does it prove the main point that the world consciousness is an apparent and unreal modification of the ever unmodifiable Brahman and therefore to be dispelled as quickly as possible, so that I may cease to exist, except insofar as I already eternally exist, not at all as I, but as the Brahman?
Above all, does it show that my one practical business is to get rid of a world consciousness which is of no value and has no purpose except self-bewilderment, and become again what I ought never to have ceased to be in my unreal consciousness, as indeed I am still that in my real consciousness, the featureless and immutable Spirit? Is the world really a valueless dream, a purposeless delirium of ignorance? Have we no other true spiritual business here except to get out of it? These are the real questions that the soul of man asks of the illusionist thinker, and we have to judge his answer.

Existence is not a fluke, a random creation by nobody, a thing that unaccountably happened to be. It carries in itself the Word of God, it is full of a hidden Divine Presence.

Existence is not a blind machine that somehow came and started a set ignoble motion without object or sense or purpose. Existence is a Truth of things unfolding by a gradual process of manifestation, an evolution of its own involved Reality.

Existence is not an illusion, a Maya that had no reason, no business to exist, could not exist, does not exist but only seems to be. A mighty Reality manifests in itself this marvellous universe.

All that is is the manifestation of a Divine Infinite. The universe has no other reason for existence.

There is an eternal manifestation and there is a temporal manifestation; both are without end or beginning even as That which manifests is without end or beginning. Time and its creations are for ever.

The temporal manifestation is cast partly in a gradation of enduring types; partly it moves through a long unrolling series of vicissitudes of change and new formation and is evolutionary in its process.
The typal worlds do not change. In his own world a god is always a god, the Asura always an Asura, the demon always a demon. To change they must either migrate into an evolutionary body or else die entirely to themselves that they may be new born into other Nature.

45

All that is is the manifestation, even as all that is not is the self-reservation, of a Supreme, an Infinite who veils himself in the play of impersonal forces, in the recesses of a mysterious Inconscience and will at last rediscover here his most intimate presence, his most integral power, light, beauty, Ananda and all vast and ineffable being through a growing illumination of the still ignorant consciousness now evolving in Matter, a consciousness of which Man is only one stage, at once the summit of an ascent that is finished and the starting point of a far greater ascension that is still only preparing its commencement.

All manifestation that is not evolution is a play and self-formulation of the One Infinite in one term or another of his existence, consciousness-force, Ananda, his self-knowledge, self-power, self-delight, for the glory, joy and beauty of the play and for no other reason.

All evolution is the progressive self-revelation of the One to himself in the terms of the Many out of the Inconscience through the Ignorance towards self-conscious perfection.

The evolution has a purpose, but it is a purpose in a circle. It is not a straight line or other figure of progression from the not to the is, from the less to the more.

There is no beginning or end of the Universe in space or time; for the universe is the manifestation of the Eternal and Infinite. Manifestation is not an episode of the Eternal. It is his face and body of glory that is imperishable, it is the movement of his joy and power that needs not to sleep or rest as do finite things from their labour.

In the beginning, it is said, was the Eternal, the Infinite, the
One. In the middle, it is said, is the finite, the transient, the many. In the end, it is said, shall be the One, the Infinite, the Eternal.

For when was the beginning? At no moment in Time, for the beginning is at every moment; the beginning always was, always is and always shall be. The divine beginning is before Time and in Time and beyond Time for ever. The Eternal Infinite and One is an endless beginning.

And where is the middle? There is no middle; for the middle is only the junction of the perpetual end and the eternal beginning; it is the sign of a creation which is new at every moment. The creation was for ever, is for ever, shall be for ever. The eternal Infinite and One is the magical middle term of his own existence; it is he that is this beginningless and endless creation.

And when is the end? There is no end. At no conceivable moment can there be a cessation. For all end of things is the beginning of new things which are still the same One in an ever developing and ever recurring figure. Nothing can be destroyed for all is He who is for ever. The Eternal Infinite and One is the unimaginable end that is the never closing gate upon new interminable vistas of his glory.
Man and Superman

Man and the Evolutionary Process

46

Man is a transitional being, he is not final. He is a middle term of the evolution, not its end, crown or consummating masterpiece.

47

Man is not final, he is a transitional being. Beyond him awaits formation the diviner race, the superman.

48

God is the beginning, middle and end of all things; but in the beginning He is concealed, in the middle partly and progressively manifest, in the end revealed.

The universe is such a manifestation of God under certain conditions and in the terms of a gradually unfolding harmony. These conditions and the movements which govern the rhythms of the harmony are the universal laws.

In this manifestation the two terms are involution and evolution. The material universe starts from an involution of God in the movement of inconscient Force and the forms of inert Matter and it is impelled by the divine impulse within it to the evolution of God through the increasing manifestation of consciousness and conscious power which must culminate in a perfect and infinite self-knowledge, self-mastery and self-delight. By the involution we mean a self-concealing of the Divine in a
descent of which the last rung is Matter, by the evolution a self-revealing of the Divine in an ascent of which the last rung is Spirit.

Since evolution or a gradual self-unfolding is the essential movement of the universe, the impulse of all life in the universe must be to self-fulfilment and the realisation of its utmost potentialities. Behind each form of life there is a divine idea which determines its form and its limits and the form circumscribes the potentialities of the life. Therefore the self-fulfilment of the life is contained within certain limits fixed by the nature of the life and the law of its being and action which that nature determines.

The idea which thus determines is the cause and the form which thus limits the sign of the Finite in the universe. The universe is an infinity creating innumerable finite expressions of itself in idea and form within its own infinite being. The one and infinite is the soul and reality of each finite; the multiple finite is the rhythm, movement and harmony of the infinite.

Therefore in and behind all finite life in the universe there is an infinite reality seeking to arrive at itself which must in its self-unfolding create finite forms of life which are yet able in their consciousness and movement to manifest and realise the infinite. Man is such a finite-infinite and the sole type of such a form of life that yet exists upon the earth.

All life and mind on earth is the story of a Being, a Consciousness, a Power, a Joy that is darkly imprisoned in the apparent inconscience of Matter and is struggling for liberation. Blinded, cabined, drugged, immured, it is yet ever striving to come out of the black cell of this obscurity into its own light, wideness, conscious sight and force, self-aware action, bliss, freedom, harmony, perfection. It starts with small beginnings, as a vibration in the metal, as a feeling out and drawing in and a groping and [?infusing] in the plant, as a crude or minute power of sensory life-urge rising to an instinctive reason and mind and purposeful force in the insect, as a more organised and
conscious and emotional, even a roughly and narrowly thinking and planning vital being in the animal, and has persevered till it has broken into some half opening on itself in the thinking, reasoning, willing and aspiring nature of man, the Manu, the mental creature. Here at present it stands not by any means satisfied, but it would seem, feeling out for something more entirely itself, some supreme manhood or supermanhood, some beginning of godhead that would be at last its true self-finding and triumphant manifestation out of matter, even here in this limited and limiting earthly Nature.

This striving and slow outburst of Something that was hidden all along in Matter, in the Inconscient, is the whole sense of Evolution—not the mere development of a more and more organised living body out of protoplasm, as the scientists with their eyes fixed only or mainly on physical things would have it, but the struggle of Consciousness somnambulised in Matter to wake and free, find and possess itself more and more completely, the emancipation and slow self-revealing of a Soul secret at first in Force and Form, the growth of a Spirit.

This evolution, it is sometimes pretended, ends in man, man is the term and end; but this is because we miss the real values of the process. At first indeed we see this Spirit spending numberless millions of years to evolve a material system of worlds empty in the beginning of life, a lesser but vast enough series of millions to develop an earth on which life can inhabit, a lesser series of millions to make possible and train, raise life itself with but a feeble and restricted apparatus of mind; but once it has found a body, a brain, a living apparatus not perfect, but still sufficient it is no longer concerned mainly with evolving a body or [. . . ] an embodied life but can at last grapple with its own proper business. Evolution henceforth means the evolution of the consciousness, of mind and, if any such thing there be, of what is beyond mind,—and in that case as its last stride has been the evolution of the mental being, man, out of the vital being, the animal, so its next stride will be to evolve out of mental man a greater spiritual and supramental creature.
All mind and life on earth are the progressive manifestation of a Spirit or Being that has involved itself in Matter and is slowly evolving in Matter, against the inconscient resistance of a first rigid material self-formation and under its conditions, its own secret powers and nature. In the Inconscience in which it has involved itself, these powers, this nature seem not only to be hidden but contradicted; cast into their own opposites they emerge with difficulty and labour at first in flickers and faint glimpses, then growing into a better but still much diminished figure. But the evolution cannot be considered at an end until these diminished figures growing more and more free, developed, powerful arrive at their own complete fulfilment, revelation of their truth, native perfection, beauty and greatness. This is the aim of terrestrial existence — to reveal in Matter, in Time-Space, in figure and body what was once self-held only in an eternal unembodied self and spirit.

In order that this evolution might be, an implacable plunge of supreme Consciousness and Being into an apparent void of insentience, inconscience, non-existence was inevitable; for without that plunge, immergence, seeming yet effective annihilation [in] its opposite the creation of that phenomenon of cosmic Energy which we call Matter would have been impossible. Yet however effective this appearance is only an appearance. In the void of that Non-Existence all the powers of being are held involved and latent; in the impenetrable darkness of that Inconscience all the possibilities of consciousness lie ready to be evolved; in that insentience is a drowned Delight of Existence which emerging in the contradictory figures of pleasure and pain can struggle upwards towards cosmic expression of its own truth of the Bliss that supports all things.

To ask why this plunge was taken at all, why such an evolution slow, gratuitous, painful should ever have been undertaken is natural for man struggling painfully with his own transience, ignorance and suffering — inevitable consequences of that plunge or fall — but from the cosmic point of view
irrelevant and otiose. A possibility was there in the Infinite and outlined itself for manifestation, the lines of an evolutionary world amidst the numberless possibility or numbered reality of various universes, and it was undertaken because the Spirit in things is afraid of no possibility of itself but is rather ready to sanction all by its will towards manifest existence. To the Cosmic Spirit which sees things as a whole, the working out of this universe or any universe is self-justified, the obscure labour of the emergence no less than the glory of its completion and final perfection in a yet unattained light, bliss and greatness.

At any rate into this world of evolution something of the eternal spirit has thrown itself, with all in it that consented to the descent and to fulfil the world, not to escape from it, is the deepest meaning of the Spirit and Godhead within us and the universe.

This then must be our will in terrestrial existence — being mind in matter to grow into the Spirit, being man-animal to emerge into the Godhead, to expand out of our limited sense of existence into freedom and infinite wideness, out of the half figure of consciousness we have realised to be illumined into true consciousness, out of weakness to realise divine Mastery, out of the dual experience of pain and pleasure to emerge into possession of the cosmic Bliss of existence, out of the dull chrysalis of our limited selves to flower into oneness with the Divine Self that we are. For this is not an egoistic will in us but the meaning of the Divine Inhabitant for which he has undertaken bodily life and terrestrial existence.

Before there could be any evolution, there must needs be an involution of the Divine All that is to emerge. Otherwise there would be not an evolution, but a successive creation of things new, not contained in their antecedents, not their inevitable consequences or followers in a sequence but arbitrarily willed or miraculously conceived by an inexplicable
Chance, a stumblingly fortunate Force or an external Creator.

The long process of terrestrial formation and creation, the ambiguous miracle of life, the struggle of mind to appear and grow in an apparent vast Ignorance and to reign there as interpreter and creator and master, the intimations of a greater something that passes beyond the finite marvel of mind to the infinite marvels of the Spirit, are not a meaningless and fortuitous passing result of some cosmic Chance with its huge combination of coincidences; they are not the lucky play of some blind material Force. These things are and can be only because of something eternal and divine that concealed itself in energy and form of Matter.

The secret of the terrestrial evolution is the slow and progressive liberation of this latent indwelling spirit, the difficult appearance, the tardy becoming [of a] divine Something or Someone already involved with all its potential forces in a first formal basis of supporting substance, its greater slowly emerging movements locked up in one initial expressive power of Matter.

Man the thinker and seeker would not be here if he were not an embodied portion of an all-conscious Infinite that is superconscient above him but lies also hidden in the inconscience of the material universe.

The development of forms is not the most important or the most significant part of the evolutionary process; it is one sign of the thing that is being done, but it is not its essence. Material form is only a support and means for the progressive manifestation of the Spirit.

If all were chance or play of inconscient or inconsequent Force, there would be no reason why man with all his imperfections should not be the last word of this feat of unconscious intelligence or this haphazard miracle. It is because the Divine Spirit is there and his manifestation the meaning of the movement that a new power must emerge in the series that started from Matter.

The material universe would be a waste if wonderful desert
if Life had not appeared as the first index to some marvellous utility and an ultimate profound and moving significance. But life too by itself would be a movement without sequence to its purposeful initiation or any light to its own mystery if in Life there were not concealed an interpretative or at least a seeking power of consciousness that could turn upon its powers and try to grasp and direct them towards their own realised issue.

Our life is neither an accident nor a mechanism; it is not a freak of some wide-spread self-organising Chance, nor is it the result of a blind unaccountable material Necessity.

What we call Chance is a play of the possibilities of the Infinite; what we call Necessity is a truth of things working itself out in a Time-sequence of the Infinite.

It seems indeed to be born from a cosmic Inconscience which, pushed somehow towards world-building, does what it can or does what it must but in either case knows nothing of itself or of its own action. Yet is there a meaning in these workings, a conscious intention; our life is led by the will of some secret Being, secret perhaps within its own phenomenon, towards the solution of this packed cosmic Mystery, the unrolling of a willed and mighty Enigma.

What we see in and around us is a play of God, a “Lila”. It is a scene arranged, a drama played by the One Person with his own multitudinous personalities in his own impersonal existence,—a game, a plan worked out in the vast and plastic substance of his own world-being. He plays with the powers and forces of his Nature a game of emergence from the inconscient Self out of which all here began, through the mixed and imperfect consciousness which is all we have now reached, towards a supreme consciousness, a divine nature.

This we cannot now know; our eyes are fixed on a partial outer manifestation which we see and call the universe—though even now we see and know very little of it or about it, know

www.holybooks.com
perhaps a few of its processes but nothing fundamental, nothing
of its reality, — and an inner partial manifestation which we do
not see but experience and feel and call ourselves. Our mind
is shut up in a cleft between these two fragments and tends to
regard it as the whole of things and the only tangible and real
existence.

It is so that the frog regards himself and his well. But we have
to grow out of this frog consciousness and exceed the limits of
this well. In the end we come to perceive that we have a truer and
divine being of which our petty personality is only a surface and
corrupted output, a truer and divine Consciousness in which we
must become self-aware and world-aware discarding our present
fragmentary and bounded mental vision of self and things.¹

The term of our destiny is already known to us; we have
to grow from what we are into a more luminous existence,
from pleasure and pain into a purer and vaster and deeper bliss,
from our struggling knowledge and ignorance into a sponta-
neous and boundless light of consciousness, from our fumbling
strength and weakness into a sure and all-understanding Power,
from division and ego into universality and unity. There is an
evolution and we have to complete it: a human animality or
an animal humanity is not enough. We must pass from the
inadequate ®gure of humanity into a ®gure of the Godhead,
from mind to supermind, from the consciousness of the ®nite
to the consciousness of the Infinite, from Nature into Super-

* * *

This is no vaulting imagination, but the inevitable outcome of
our still unfulfilled being and incomplete nature, a necessity of
the evolutionary world-urge: because things are what they are,

¹ The following sentence from an earlier draft was not incorporated in the final version
of this piece:

Our life is a journey towards the bliss of a vaster and happier existence, — not merely
elsewhere in a far-off Paradise, but already here upon earth, ihaiva, in the terrestrial life
and in an earthly [body.]
this too must be. For things are what they are, but not what they were; they cannot remain for ever what they are, but must grow into what they can be and shall be. And what they shall be can be nothing less than the exceeding of their present imperfection, the fullness of what they have only half become; but it may and must be something more than that, they must grow into their own concealed reality, their nature must reveal what is now concealed, their real self.

The perfection of species or of types is not what is aimed at; the type is often perfect [within its] limits, for it is the limits that make the type; the species too can be perfect in itself, perfect in its own variation of the genus and the genus perfect by the number and beauty or curiosity of its variations. But what we see in Nature is that it strives ever to exceed itself, to go beyond what it has yet done. For having achieved in the animal the whole of which animality was capable, it did not in achieving man endeavour to produce the perfect synthetic animal, it began at once working out something more than the animal. Man is to a certain extent a synthesis of several animals; he might even be said to synthetise all, from the worm and the skink, to the elephant and the lion; but as an animal he is terribly imperfect. His greatness lies in his being more than an animal and by this new nature he has exceeded the animal and made up for all his deficiencies even in the region of the struggle for life. Comparatively defenceless at first, he has become the master of the earth; he is not merely primus inter pares; he is a sovereign and the others are not any longer, even if they were ever his equals.

53

The world we live in is not a meaningless accident that has unaccountably taken place in the void of Space; it is the scene of an evolution in which an eternal Truth has been embodied, hidden in a form of things, and is secretly in process of unfoldment through the ages. There is a meaning in our existence, a purpose in our birth and death and travail, a
consummation of all our labour. All are parts of a single plan; nothing has been idly made in the universe; nothing is vain in our life.

The evolution is arranged or arranges itself according to this plan. It begins here with a system of worlds which seem to be dead, yet in perpetual motion; it proceeds towards birth and life and consciousness, justifying Matter; it finds the justification of birth in thinking man; [?] to divinity. A slow [?] of godhead in Matter, this is the sense of the material universe.

Man is a transitional being, he is not final. He is too imperfect for that, too imperfect in capacity for knowledge, too imperfect in will and action, too imperfect in his turn towards joy and beauty, too imperfect in his will for freedom and his instinct for order. Even if he could perfect himself in his own type, his type is too low and small to satisfy the need of the universe. Something larger, higher, more capable of a rich all embracing universality is needed, a greater being, a greater consciousness summing up in itself all that the world set out to be. He has, as was pointed out by a half blind seer, to exceed himself; man must evolve out of himself the divine superman: he was born for transcendence. Humanity is not enough, it is only a strong stepping stone; the need of the world is a superhuman perfection of what the world can be, the goal of consciousness is divinity. The inmost need of man is not to perfect his humanity, but to be greater than himself, to be more than man, to be divine, even to be the Divine.

To rest in humanity is to rest in imperfection; the perfect man would be a self-contented finality of incompleteness. His nature is transitional and there is therefore in it an innate tendency to strive towards something more.

— Unless indeed he turned aside from his destiny, became a two-legged termite content with a perfectly arranged or sufficiently comfortable material order. He would [ . . . . . ] exist, deteriorate or become stable like the ant or the dung-beetle or after attaining complete efficiency, disappear like the sloth, the mammoth, the pterodactyl or the dinosaur. His innate reason for existence would have ceased and with it his necessity for being.
But this cannot be; there is something in him that forbids it. But this most — that humanity cannot realise itself except by passing into supermanhood.

The saint, the sage, the seer, the inspired man of action, the creator, — these are his summits of being. Beyond him is the supramental being, the spiritual superman.

Our existence in the cosmic order is not an accident, the purposeless freak of a Chance which happened to organise itself into a world or the product of a blind Force which has somehow managed to exist in what we call a void Space and executes there [soulless] inexplicable revolutions, as if compelled by its own causeless necessity; nor is man the result of a chemical combination of gases by an Energy which has somehow, being radically inconscient, succeeded without intending it to produce consciousness and started writing poems, painting pictures, producing civilisations, conceiving an inexistent God and invisible Creator. There is surely more in it than that; there was [an] Idea somewhere [and if it] has emerged it is because it was [ . . . ] and had to emerge.

If there is an intelligence which has appeared in Matter and is constantly developing its height and its range, this can only be because there was already an intelligence there, asleep, involved, latent or in some way a possibility of Matter, which has come forth from latency when things and conditions were ready. Or else it [is] because behind or in the world immanent in it there is an Intelligence which has created or is manifesting this world and at the right time has sent this power of itself [ . . . . . . . . ]

The nature of evolution according to physical Science is a development of forms more and more suitable to an increasingly complex and subtle development of Life and incidentally only to a more and more complex and subtle consciousness serving the ends of Life. This consciousness is a temporary phenomenon beginning in each form with birth and ending with
death of the body. Consciousness then is a circumstance of body and incapable of survival of the body. There is no such thing per se as consciousness. A consciousness not dependent on the body, expressing itself in it as its instrument, a soul or spirit, is therefore a myth, an imagination; if it existed, it would be an unwarrantable intrusion into the nature of things as seen in this material universe; or, since everything in this universe is dependent on Matter, arose from Matter, is a circumstance or result of Matter and returns to Matter, soul too would be a circumstance or result of Matter, would act by it and in it only, would return finally to Matter. Consciousness itself is a phenomenon of Matter, is nothing but Matter in action, a combination of phenomenal action of chemical or other physical entities and operations and can be nothing else. It is unproven and unprovable, — though it may be that it is also not disproved and not disprovable. Either it must be left in a barren light or no light of agnosticism or is at most a matter of faith and not of knowledge.

But all this only means that Science has not any adequate means to deal precisely with the supraphysical nor can it collect and handle all the necessary data; it can deal only with the physical and with the physical side of the supraphysical; and that is not enough. Faith and knowledge are themselves supraphysical things with which Science cannot deal; for psychology at present is not a science; it is only a dispute between different bundles of inferences and guesses.

* * *

Man is not final, he is a transitional being.

This imperfect thinker embarrassed by the limitations of his brain and senses, this ignorant mind seeking after the truth of himself and things and never arriving at a certain knowledge, this stumbling reasoner capable only of speculation and stiff logical conclusions but not of indubitable conclusions or of a complete or direct knowledge, this imperfect liver divided between his reasoning will and his half-governed impulses and
instinctive desires, this thing of bundles of ideas and sensations and lusts and longings, this hunter after forms and formulas, this suffering and sorrowing mixture of wisdom and imbecility we call man is not the final essay of Nature, her last word, the crown of her evolution, the summit of consciousness, her master creation.

* 

The central fact, the essential and cardinal significance of the evolution is not development and perfection of the outer and instrumental form, but the development [and] increasing perfection of consciousness. If human consciousness had been something complete, consummate, a ne plus ultra, then we could confidently say that here was the summit, here the crown and end of things and beings, here the perfected creation and the supreme terrestrial creator. Or if his consciousness though imperfect showed signs that it could arrive [at] the very top of possibility, rule earth and discover heaven, then we might believe that man was the last instrument by which Nature was passing from the terrestrial to the highest stage developing out of her initial inconscience a supreme conscient being.

But man seems to be by his very mould of nature a being with an animal living out of which he grew and a mental boundary beyond which he cannot pass.

For mind is the man, mind cramped into a body and entangled in the intricate machinery of a laborious and precarious physical organism which helps it less than it hampers. Mind’s only data for knowledge are the motions of terrestrial life, the motions and processes of the physical world and its own processes and motions. Its notions about other things are merely speculations, guesses, imaginations; it thinks about them by means of abstractions, it cannot grasp anything concrete. It can observe life and know it by observation and inferences from observation or it can know by theory; it can find out its constituent parts and its processes. Its knowledge of itself is of the same
variety; it traces out the processes of thinking, demarcates the observed constituents of personality; it evaluates men from what they say and do, not from what they are, for that it cannot see. It discovers by analysis or makes a synthesis by fitting together the fragments of things. Eventually it discovers the phenomenon, but misses the reality; it knows things as objects but knows nothing about things in themselves. Reality is beyond its grasp, it is only sure about the appearance. This is much for one who emerged out of nescient Matter and started as the ignorant animal, but it is not enough to make of man the crown of creation and the last apex of the evolution.

If man’s knowledge and his way of knowledge are imperfect, still more imperfect are his living and his doing. [His] works sometimes attain perfection. Some men have done well in poetry and the arts and crafts, more have done badly, most are conventional copyists or botchers. In science and works with a scientific basis, men have certainly done well and their works were often efficient or masterly, for there all is method and rule and there the human mind seeks to master and execute what he has to do and that he can always do. Few have insight in works, fewer have any originality. Journeyman’s work he can do, for man is essentially a journeyman. He is skilful in putting things [up], buildings, a job, a swindle. In pulling down he is perfect, a destroyer ne plus ultra. The world is full of his constructions, but more pervasive is his destruction; but that leaves few traces. But still the great doers are few in number, the good doers are many, the poor doers are legion, the evil doers hardly less. All this shows that he is a transitional and evolving animal, the highly evolved are rare, the poorly evolved numerous, the ill-evolved a multitude.

Living is more difficult than doing; though it is universal, and ought to have become easy by practice, it is commonly ill done, almost universally botched or half worked out. Human society is a ramshackle affair; it is top-heavy, over-elaborate and opulent at the top, below a multitudinous level. When he tries to reform his world, he sets out to level everything down towards
or even to the worst. He can force all things down to the level of a universal proletariat, but he cannot make of the proletariat a universal aristocracy.

55

There are two states of being, two levels or limits between which all existence stands or moves, a highest limit of supreme consciousness, an omniscient Superconscience, a nethermost limit of supreme unconsciousness, an omnipotent Inconscience. The secret of consciousness reveals itself only when we perceive these two limits and the movement between them which we call the universe.

There can be no consciousness without existence, for the consciousness of a Void or a Nihil is a vain imagination, a thing impossible. For Nothing cannot be conscious of anything—cannot be conscious of itself; if it were conscious of itself, it would at once be an existence aware of itself, it would cease to be a Nihil; it would at once be evident that it was all the time an Existence appearing to be Nihil, that it was Being or a Being unconscious, but now grown conscious of its own existence. A void conscious of itself is conceivable, but it would then be a void existence and not Nihil. There might be an eternal Non-Being, but that too could not be Nihil; eventually it could only be a supreme superconscient existence exceeding our notion of Being. A true Nihil would necessarily be as incapable of consciousness as of existence; out of it nothing could come as in it nothing could be, neither spirit nor soul nor mind nor Matter.

We have then at one end of things a supreme superconscient existence and [at the other] a supreme inconscient existence and between them we have consciousness in the universe; but both are two states of one Being; what is between also is movement of that one Being between its two ends, its two highest and lowest levels of self-manifestation. *Ekam evadvitiyam.*
All existence upon earth is an evolution of what has come down from a superconscious Eternity to be involved here in a subconscious Infinite.\(^2\)

That Eternity and this Infinite are the same Essence in opposite powers, but the one appears as a dark shadow of the other. The Superconscient is hidden from us because it is wrapped in its own being of illimitable light; the Inconscient escapes our search because it is plunged in its own veil of impenetrable darkness.

All that manifested from the Eternal has already been arranged in worlds or planes of its own nature, planes of subtle Matter, planes of Life, planes of Mind, planes of Supermind, planes of the triune luminous Infinite. But these worlds or planes are not evolutionary but typal.

A typal world is one in which some ruling principle manifests itself in its free and full capacity and energy and form are plastic and subservient to its purpose. Its expressions are therefore automatic and satisfying and do not need to evolve; they stand so long as need be and do not need to be born, develop, decline and disintegrate.

For evolution to be necessary there must be an opposing medium or recalcitrant instruments or an involution of the thing in its opposite. This is what has happened in the terrestrial world. Spirit has to evolve out of matter, consciousness out

---

\(^2\) Three drafts of this piece exist; the first paragraph of each of them is identical, or almost so. From the third paragraph, the second and third drafts were developed on different lines by Sri Aurobindo. These two drafts have been printed as pieces 56 and 57. The first draft, much shorter, contains a few phrases not taken up in either of the other drafts. It is printed in its entirety below:

All existence upon earth is an evolution, in an ascending series of figures, of what came down from a superconscious Eternity to be involved here in a subconscious Infinite.

What was involved evolves slowly; each manifested term of the evolution is a step in the series and presupposes another step beyond it. There can be no finality until a perfect potential is reached which can express all the possibilities of the involved Godhead.

The evolution is from the Inconscient; therefore at first ignorant, feeling its way rather than consciously finding it. But its significant element is a growing consciousness which must at last emerge out of ignorance into Knowledge. When that happens the evolution will become conscious, aware of its way, no longer a stumbling search or precarious growth but a luminous outblossoming of the Divine.
of the Inconscient, life out of inanimation, mind out of a life that is void of thought; out of mind and its fragmentation and difficult piecing together of things the automatic completeness of the supramental knowledge.

There is a secret self-compulsion in the Inconscient to manifest what is involved — gaoled, suppressed and inactive within it, but also there is a stupendous Inertia, as of some fathomless cosmic sleep, that resists the will to manifest and retards the evolution. There is thus an upward levitation towards the luminous eternity of the Spirit strongly countered by a downward gravitation back towards the Inconscience.

This Inertia was needed in order that the evolution might be gradual by aeonic process and not an explosion of the concealed elements either into a rapid self-ordered typal series or into their original superconscience.

As a consequence of this retarding force what is involved evolves with difficulty and slowly. Evolution is a struggle between an insistent call to manifestation and an iron retardatory reluctant Inertia. Evolutionary existence is precarious because the downward gravitation back to its source contradicts powerfully both the stress from within towards permanence and the pull from above towards self-transcendence. Matter in our world can easily dissolve into its elements, life sink back into death, mind relapse into unconsciousness. A type evolved, animal or man, struggles slowly and with much difficulty into manifestation, it is less difficult for it to disappear, as disappeared the mastodon and the dinosaurus. Hence the law of a precarious impermanence laid on the forms of Matter which is corrected only for a time by the lavish will to reproduction in Nature.

As the evolution is from the Inconscient, it is not only a precarious but also an ignorant movement feeling its way rather than consciously finding it. But still its most significant term is a growing consciousness which must at last emerge out of ignorance into knowledge. When that happens, the evolution will become a willed and conscious movement, aware of its process and its way, no longer a stumbling search or a precarious growth
but a luminous outflowering of the Divine.3

The call to manifestation is composed of a double current of Force moving between two poles. There is a will or at least an urge in the Inconscient itself, slow, dumb, obscure but imperative and inevitable towards the revelation of its involved contents. But there is also a pressure from above from the already established Powers for their manifestation in Space-Time here and for their evolutionary possibilities in the world of Matter. A world of subtle Matter presses on the shapeless Inconscient for the manifestation of forms; a world of essential Life presses on form of Matter for the manifestation of an embodied life; a world of essential Mind presses on animate life for the manifestation of mind in the living body. This compulsion is so great as to contradict and counteract finally the refusing and retarding Inertia.

Above on the summits of existence is all that is beyond Mind and all that is the complete splendour of the Spirit. These too wait for their hour of manifestation, their turn for revelation in Time and Space and the evolving series of the powers of the Eternal.

All existence upon earth is an evolution of what has come down from a superconscious Eternity to be involved here in a subconscious Infinite.

The superconscious Eternity to which we tend and the subconscious Infinite from which we rise — for we are a part of both and we stand between them as their developing link — are opposite powers of the same Being, are indeed, in their essence, one and the same Being; but one appears to our experience as a dark and void shadow of the other. The Superconscient is hidden

3 The incomplete passage that follows apparently was intended for insertion here:
A third consequence of the origin of the evolution is its character of struggle and suffering. For all is involved here in its opposite. Being descends into the phenomenon of Non-Being and has to emerge from it. Consciousness descends into the worldwide Inconscience and is involved in its night. Force descends into
from us because it is wrapped in its own being of illimitable light; the Inconscient escapes our search because it is plunged in its own veil of impenetrable darkness.

What comes down from the Superconscient is self, spirit, the wide and all-containing Essence of the eternal existence. It plunges, carrying its powers in it, into an infinite ocean of inconscience, apraketam salilam, and hides itself there. It hides itself and its powers from itself — it appears in us as its own opposite.

The Self is an immortal and unseizable essence and substance of all things, it is a pure omnipresent omniscient omnipotent existence. It appears to our experience when we emerge from the subconscient as a mysterious Void or Nihil, indeterminable yet from it all things and forms are, inconscient yet flowering into consciousness, inert yet manifesting enormous energies, lifeless yet the parent of life, insensible yet a fountain of pain and pleasure. This impossibility, this universal contradiction is unreal and born of our ignorance; yet that ignorance is not ours, but a result of the inconscience which was imposed on itself as a veil by the involved Self and Spirit. For if that Inconscience were not there, the evolutionary emergence of the Self which is the law and object of this universe would not have been possible; all would have flowered into a manifestation too immediate, too irresistibly powerful in its process, too absolute.

The Self, the Spirit is a pure existence, a spiritual substance that is self-aware and therefore all-aware. It is in its nature an absolute and omniscient consciousness, eternally comprehending all itself, all in itself and would naturally manifest as an absolute, unwalled, indivisible knowledge. It becomes an inconscience out of which consciousness struggles brokenly into light, seeking and groping for itself, groping after signs and intimations of its substance, but finding at first only fragmentary signs and separated forms and objects which seem not itself. The consciousness in the individualised form becomes aware of itself by the shock of things outside that are or seem to be not itself. It becomes aware of itself as a separated form and only when it grows more and more deeply self-conscious slowly becomes aware of all outside
it as part of its own continuous indivisible existence.

The nature of the Spirit’s consciousness is a self-existent Force which in action becomes a spontaneously self-manifesting or, as it seems to us, self-creating and self-determining energy. It is omnisciently omnipotent and creates out of itself what it wills under whatever conditions it wills — for its will is that of an infinite and infinitely variable self-aware oneness whose steps, no matter what they are, are by necessity the movement of a perfect Truth and Knowledge. But it is by an equal necessity the very opposite when the manifestation of the Substance of things becomes the working of a void Inconscience. For even if that Inconscience be only apparent because an all-knowledge and its force are hidden there, yet this error, this phenomenon of Inconscience is and was intended to be dynamic and operative. In other words, all had to look and appear as the gropings of an Inconscience whose results in their upshot were yet those of an ordered and imperative Intelligence. An inert Soul guiding with a strange and blind sureness the steps of a somnambulist Nature would be no inadequate image of the apparent Spirit of this material universe.

This material world sprung from the subconscious Infinite appears to us as if [it] were the sole actual universe and even perhaps the only creation possible. But that is because we are limited by our senses which we now know to be restricted in their field and even there fallible. The material senses by their very nature can perceive only material things and from that our still infantile external reason infers that only material things exist and there is nothing else. All forms that are immaterial or of another substance than ours are and cannot but be illusions, hallucinations, unreal images. But a being otherwise constituted in consciousness or sense could well see this world in other figures than present themselves to ours. Another would see perhaps other worlds made of another, a subtler material or an essentially mental or vital or spiritual substance. A world is only an arrangement of things as experienced by consciousness of the Spirit and this consciousness can see all kinds of things in all kinds of ways according to whatever plane of itself, whatever medium and whatever instruments it has produced for its
Man and Superman 241

We shall understand nothing of existence if we confine our vision to the particular view of things our primary consciousness and its instruments which are physical impose upon us; for this consciousness is only a surface phenomenon of ourselves and our total being is far deeper, higher and vaster than that, our possibilities extend infinitely beyond their present limit, and the world also is far more complex than the first crude inexplicable mystery of Matter would lead us to imagine.

The immense material world in which we live is not the sole reality but only one of innumerable potential and existent universes; all of them need not have either Matter as we know it or the Inconscient for their base. Indeed this world of matter is itself dependent on many planes of consciousness and existence which are not material; for these have not this gross substance as their foundation or as the medium of their instrumentation of energy and consciousness or their primary condition of existence.

All the powers that are involved here in the inconscient Infinite and that we see rising out of it,—mind, life and what is beyond mind no less than matter itself—have their previous existence and are not merely evolutionary results of Nature in this universe. They have not only a preexistence but also their separate planes of manifestation in which each in turn is, as matter is here, the foundation, the medium of instrumentation, the primary condition of existence.

All terrestrial existence is the slow surge of a hidden Consciousness mounting up out of an apparent Inconscience towards its own perfect and luminous manifestation. This is the secret of evolution and its significance.4

There is a spirit secret even in things immobile, — there is an All-Consciousness disguised in the Inconscient. In Matter life

4 Sri Aurobindo left out the sentence that follows when he revised the first draft of this piece:

All else is only veils and means and forms, conditions and stages, action and counter-action of this great half-veiled becoming which is the heart of the earth’s enigma

www.holybooks.com
is embedded, in Life is an enveloped mind, in Mind is concealed a greater supramental and spiritual being not yet manifested. These are the significant and illumining terms of the riddle.

Evolution is the labour of Nature, or let us say at once of the Energy of the secret Spirit, working in the semblance and under the limiting conditions of an inconscient Power to release these latencies each in its turn out of their involution in the original Inconscience.

It is an All-consciousness that is working, the force of a self-aware cosmic Spirit, and the emergence of its secret powers is implied in the very nature of existence; therefore the result is inevitable.

Science has discovered a physical evolution hidden in the past history of the earth of which the living record remains in the embryo; but the physical evolution is only an outward sign, means and material condition of a still more secret evolution. A spiritual evolution, an evolution of consciousness is the inner fact which alone illumines the problem of earth existence and opens to it its true solution; apart from it our life here has no intelligible significance.

Ancient Indian thought discovered an evolution from birth to birth, from the life of tree and plant to the life of insect and animal, from the life of the animal to the life of man, attained with difficulty through the ages. This slowly attained human life it took to be the key of release from the baffling circle of the enigma. After some eighty and more lakhs of births, says the Tantra, a soul reaches the human form and consciousness and sooner or later finds the secret of escape from birth in time into the birthless and deathless Eternity from which it came.

These two discoveries seem at first sight quite unconnected and disparate. In one it is a physical Life in the cosmos that evolves and the individual is only an ephemeral member of the species, the species a means of this cosmic evolution. Mind is indeed the term and the mental human being the crown of this inexplicable emergence; when human progress is over, when the race decays and perishes, the cosmic evolution will be at an
end, for it has nothing more then it can do. In man it has shot its bolt; nothing more is possible. Consciousness emerging out of the Inconscient has achieved this shoddy and splendid, this winging and limping miracle of the ever-seeking creative Mind of Man and sinks back into the Inconscient; its emergence had no discoverable significance, its brief play and cessation make no difference to the meaningless rounds of an inconscient universe.

In the Indian view it is the individual that evolves from birth to birth and the hierarchy of the vegetal, animal, human kinds [is] a fixed unchanging ladder for its ascent. A successive creation of higher and higher species is envisaged in the Upanishads as well as the Puranas and heredity affirmed as a means of conscious continuity of the human embodiment of the Spirit, but still the evolution is individual and not cosmic, spiritual not physical. Yet here too this persistent phenomenon of spiritual embodiment appearing from the bodiless Spirit and evolving back into the bodiless Spirit seems to be devoid of significance.

If stripped of their limitations the two discoveries can be regarded as complementary rather than disparate. There is evidently an evolution; Matter first manifests out of the Formless — inanimate in appearance; in Matter life manifests unconscious in appearance; in life mind manifests in the animal but instinctive and irrational in appearance; in life-mind thinking mind appears rational but yet self-ignorant in appearance, — for it seeks to know but yet does not know the secret and significance of its own existence. It is not yet undisputed but it is affirmed that in thinking man spirit is moving towards manifestation, spirit aware of itself and of its own secret and significance. Thus far at least an evolution is indisputable and we may affirm without hesitation that there is a cosmic Existence here which first achieves a material manifestation of itself or a manifestation in itself, a material formula, then on that basis a life formulation, a vital formula, on that again a mental formulation, a mind formula. It is possible that on that again it is preparing a spiritual formulation of self-affirmation and self-knowledge which will complete the emergence.

There is also very evidently an evolution of forms, generic
and individual in the genus and species, which enables the formulation to be effective, each in its own kind, organised so as to express more and more definite and superior possibilities of matter, more and more definite and superior possibilities of life, more and more definite and superior possibilities of mind,—more than this cannot yet be positively asserted, but this much is asseverable. If we can add that in the mental formula, in the mentalised life and body of man, a spiritual emergence is in process which has not yet reached its full possibility and that possibility is the emergence of the spiritual man or supramental being, then the object of the physical evolution and its significance becomes clear. The evolution of bodies is only a means for the evolution of consciousness and the spiritual formulation will be that in which the cosmic Existence will find its own full affirmation, manifest through the original veil of Matter its self-awareness, self-knowledge, self-realisation. The Cosmic Spirit hidden in the Inconscience is then the Alpha, its manifestation in the consciousness of spiritualised man the Omega.

The Stages of Evolution
Matter, Life, Mind, Supermind

The evolution of the earth nature is not finished because it has manifested only three powers out of the seven-fold scale of consciousness that is involved in manifested Nature. It has brought out from its apparent inconscience only the three powers of Mind and Life and Matter.

Matter, one might say from a certain viewpoint, is purely a matter of mathematics. That cannot be said of Mind or of Life.

Then again, Matter is a matter of formulas. Everything purely material is created according to a formula.
Again, Matter is a matter of magic. It is a thing of magical and irrational or suprarational formulas.

Lastly, all Matter is *matra*, a thing of degrees, measures, quantities.

We find that water is produced by a combination in a fixed quantity of the two first elements, hydrogen and oxygen. We do not know or do not yet know why this should be so. All we can say is that [it] is a fixed law of Nature that when this formula is scrupulously followed without deviation something called water appears,—becomes a phenomenon of material Nature. There seems to be no reason in this miracle. We could partly understand if oxygen and hydrogen by their very nature tended to produce in any combination water or something like water, but only in the fixed amounts could bring out the perfect article.

But this is not the case; only by the fixed relative combination can it be done. This formula then is of the nature of a magic formula. Only by pronouncing a fixed combination of words or syllables or sounds can the [. . . ] magic result follow and not otherwise. Any variation voids the effect and leaves the incantation barren.

Hydrogen itself is produced by a combination of a fixed number of electrons or electric particles of energy in a fixed relative position in their movement. Oxygen is produced by another such combination. The elements are alike in kind, it is a positional quantitative [*remainder of piece missing*]

Ether and material space are different names for the same thing. Space, in its origin at least if not in its universal character, is an extension of the substance of consciousness in which motion of energy can take place for the relations of being with being or force with force and for the building up of symbolic forms on which this interchange can be supported. Ether is
space supporting the works of material energy and the symbolic forms it creates; it is, speaking paradoxically but to the point, immaterial or essential matter[.]

62

Matter is but a form of consciousness; nevertheless solve not the object entirely into its subjectivity. Reject not the body of God, O God lover, but keep it for thy joy; for His body too is delightful even as His spirit.

Perishable and transitory delight is always the symbol of the eternal Ananda, revealed and rapidly concealed, which seeks by increasing recurrence to attach itself to some typal form of experience in material consciousness. When the particular form has been perfected to express God in the type, its delight will no longer be perishable but an eternally recurrent possession of mental beings in matter manifest in their periods & often in their moments of felicity.

63

Evolution is the one eternal dynamic law and hidden process of the earth-nature.

An evolution of the instruments of the spirit in a medium of matter is the whole fundamental significance of the values of the earth-existence. All its other laws are its values of operation and process; the spiritual evolution is its one pervading secret sense.

*

The history of the earth is first an evolution of organised forms by the working of material forces.

There follows on this initial stage an evolution of life in the form and an organisation of a hierarchy of living forms by the working of liberated life-forces. The next step is an evolution of mind in living bodies and an organisation of more and more conscious lives by the process of developing mind forces. But
even this is not the end; for there are higher powers of consciousness beyond mind which await their turn and must have their act in the great play, their part of the creative Lila.

* * *

Matter, the medium of all this evolution, is seemingly inconscient and inanimate; but it so appears to us only because we are unable to sense consciousness outside a certain limited range, a fixed scale or gamut to which we have access. Below us there are lower ranges to which we are insensible and these we call subconsience or inconscience. Above us are higher ranges which are to our inferior nature an unseizable superconscience.

The difficulty of Matter is not an absolute inconscience but an obscured consciousness limited by its own movement, vaguely, dumbly, blindly self-aware, only mechanically responsive to anything outside its own form and force. At its worst it can be called not so much inconscience as nescience. The awakening of a greater and yet greater consciousness in this Nescience is the miracle of the universe of Matter.

This nescience of Matter is a veiled, an involved or a somnambulist consciousness which contains all the latent powers of the Spirit. In every particle, atom, molecule, cell of Matter there lives hidden and works unknown all the omniscience of the Eternal and all the omnipotence of the Infinite.

The evolution of forms and powers by which Matter will become more and more conscious until passing beyond form and life and mind it becomes aware with the supernal awareness of the eternal and infinite Spirit in his own highest ranges, this is the meaning of earth existence. The slow self-manifesting birth of God in Matter is the purpose of the terrestrial Lila.

* * *

Matter is at once a force and a substance. Matter is original being, Brahman made concrete in atomic division; Matter is original substance-force, Brahman-Shakti made active in an obscure
involution of the spirit’s powers, in a self-forgetful nescience.

Matter-force casts matter-substance, material Shakti casts Matter-Brahman into form expressive of its own most characteristic powers. When that has been done, the physical world is ready for the splendid intrusion of conscious Life into the force-driven inertia of material substance.

Matter is not the only force, nor the only substance. For Life and Mind too and what is beyond Mind are also forces that are substances but of another kind and degree.

Spirit is the original force-substance; all these others are kinds and derivations of force of spirit, degrees and modifications of substance of spirit. Matter too is nothing but a power and degree of the spirit; Matter too is substance of the Eternal.

But the Matter that we see and sense is only an outermost sheath and coating; behind it are other subtler degrees of physical substance which are less dense with the atomic nescience and it is easier for Life and Mind to enter into them and operate. If finer invisible physical layers or couches did not exist supporting this gross visible physical world, that world could not abide; for then the fine operations of transmission between Spirit and Matter [could not] be executed at all and it is these that render the grosser visible operations possible. The evolution would be impossible; life and mind and beyond-mind would be unable to manifest in the material universe.

There is not only this material plane of being that we see, there is a physical life plane proper to the vital physical operation of Nature. There is a physical mind plane proper to a mental physical operation of Nature. There is a physical supermind plane proper to the supramental physical operation of Nature. There is too a plane of physical spirit power or infinite physical Being-Consciousness-Force-Bliss proper to the spiritual physical operations of Nature. It is only when we have discovered and separated these planes of Nature and of our physical being and analysed the synthesis of their contributions to the whole play that we shall discover how the evolution of vital, mental and spiritual consciousness became possible in inconscient Matter.
But there is more; for beyond these many couches of the physical existence are other supraphysical degrees, a many layered plane of Life, a many layered plane of Mind, planes of Supermind, of Bliss, of Consciousness Force and of infinite Being on which the physical existence depends for its origination and its continuance. It is higher planes that flood the constantly unfolding unseen energies which have raised its evolution from the obscurity in which it began to the splendour of a light of consciousness to which the highest human mind shall only be the feeble glimmer of a glowworm fire before the sun in its flaming glories.

There is a stupendous hierarchy of grades of consciousness between darkest Matter and most luminous spirit. Consciousness in Matter has to go on climbing to the very top of the series and return with all it has to give us before the evolution can utterly fulfil its purpose.

* * *

Matter, Life, Mind, Supermind or Gnosis, and beyond these the quadruple power of a supreme Being-Consciousness-Force-Bliss—these are the grades of the evolutionary ascent from inconscience to the Superconscience.

Life does not wholly come into the earth from outside it; its principle is there always in material things. But, imprisoned in the apparent inanimate inertia or blind force movement of Matter, it is bound by its movements and unable to manifest its own independent or dominant existence.

Life is there in the earth, rock, metal, gas, atom, electron and the other more subtle yet undiscovered forces and particles that constitute material energy and form. It is in everything, but at first a hardly detectable presence organised only to support secretly material energies, processes, formations and transformations; it is there as an involved power for the building and expression of Form of Matter, not for the expression of Life. It is not in possession of itself, not self-conscious in the form, not pushed towards self-manifestation; a helpless tool and
instrument, not a free agent, it is a servant of Matter and a slave of the Form, not the master of the house.

But above the material world there is a plane of dominant Life that presses down upon this material universe and seeks to pour into it whatever it can of its own types, powers, forces, impulsions, manifesting creative godheads. When in the material world form is ready, the Gods and Life-Daemons of this higher plane are attracted to put their creative touch upon Matter. Then there comes a rapid and sudden efflorescence of Life; the plant, the animalcule, the insect, the animal appear. A Life-Soul and a Life-Force with its many and always more complex movements are manifested in what seemed once to be inert and inanimate substance. Life souls, life minds, animal existences are born and evolve; a new world appears that is born and contained in this world of Matter and yet surpasses it in its own dynamic nature.

At each capital step of Nature’s ascent there is a reversal of consciousness in the evolving spirit. As when a climber turns on a summit to which he has laboured and looks down with an exalted and wider power of vision on all that was once above or on a level with him but is now below his feet, the evolutionary being not only transcends his past self, his former now exceeded status, but commands from a higher grade of self-experience and vision, with a new apprehending feeling or a new comprehending sight and effectuating power, in a greater system of values, all that was once his own consciousness but is now below his tops and belongs to an inferior creation. This reversal is the sign of a decisive victory and the seal of a radical progress in Nature.

The new consciousness attained in the spiritual evolution is always higher in grade and power, always larger, more comprehensive, wider in sight and feeling, richer and finer in faculties, more complex, organic, dominating than the consciousness that was once our own but is now left behind us. There are greater breadths and spaces, heights before impossible, unexpected depths and intimacies. There is a luminous expansion
that is the very sign manual of the Supreme upon his work.\footnote{The following passage from the first draft of this piece was not incorporated by Sri Aurobindo in the present draft:}

Mark too that each of the great radical steps forward already taken by Nature has been infinitely greater in its change, incalculably vaster in its consequences than its puny predecessor. There is a miraculous opening to an always richer and wider expression, there is a new illuminating of the creation and a dynamic heightening of its significances. There is in this world we live in no equality of all on a flat level, but a hierarchy of ever-increasing precipitous superiorities pushing their mountain-shoulders upwards towards the Supreme.

Plant-life is a most significant progress upon the mineral, but the difference is as nothing compared with the gulf that divides the dumb vitality of the plant from the conscious experience of the animal. The hiatus between the animal and the human is so great in consciousness, however physically small, that the scientists’ alleged cousinship of monkey and man looks psychologically almost incredible. And yet the difference between vital animal and mental man is as nothing to that which will be between man’s mind and the superman’s vaster consciousness and richer powers. That past step will be to this new one as the snail’s slow march in the grass to a Titan’s sudden thousand league stride from continent to continent.

Evolution on the terrestrial plane, even in the dullest brute matter is only in outward appearance a progression of physical function and form; in its essential fact, in its inner meaning, in its significant power, it is a progression of consciousness, a spiritual or psychological change.

At each step the spirit heightens its stature, perfects its instruments, organises better its self-expression; a new consciousness comes in, takes up the old and gives it an extended movement and another significance, adds greater, richer, more
complex movements of which the first formulation was incapable.

In the sub-vegetal world all movements, all stimulus, all reaction are of a material and if dynamic, of a mechanically dynamic character. Even the life movements that exist there, as in the mineral, are of the most rigidly automatic, unindividualised and mechanical and external nature, birth, formation, fatigue, sleep, death. Mental or psychic powers and significances there are, as an occult knowledge discovers, but of these the form seems not aware; it is something behind the life of the mineral, a consciousness supporting rather than inhabiting it, using but not used by it, that is their possessor.

In the plant world for the first time a true vital consciousness appears in earth Nature.

All the trend and purpose of Nature in terrestrial existence is to manifest the yet unmanifested. Her continual aim is to develop out of what has been evolved that which has not been evolved but is waiting to [be] liberated out of latency. This continual evolution is the whole meaning of terrestrial existence.

What has already been evolved is form of matter with life and mind housed in it, what has yet to be evolved is supermind liberating from their narrow limits and transforming mind and life and matter.

Here on earth and in the material universe matter has been the first term, the basis of things, the condition of all that must evolve here. Life can evolve here only so far as it can persuade or compel matter to give it a form and an instrumentation. Mind too has to accommodate itself to the means given it by an organised living body. There is no reason to suppose however that life in itself is limited in its possibilities to the small range realised by the living animal or human body; or the potentialities [of] mind limited to the field of powers accorded to it by the brain, nerves and physical senses, its ingenious but still very poor and unreliable instruments here.
In a world where life and not matter was the first term, condition and basis, in a vital world life would be free to organise itself in its own way with a free energy in plastic and pliable forms and its ranges of possibilities would be immense and circumscribed by no rigid limits.

But what shall be the gain won for the earth-consciousness we embody by this unprecedented ascent out of mind to whatever may be beyond it and what the significance of the supramental change? To what end shall man leave his safe human limits for this godlike but hazardous adventure?

First consider what was gained when earthly Nature passed from the brute inconscience and inertia of the first organised forms in what seems to us inanimate Matter to the vibrant sensibility of the plant range. Life was gained; the gain was the beginning of the mute groping and involved consciousness that reaches out to growth, to sense-vibration, to waking and sleep, to hunger and thirst, to physical pain and pleasure, to a preparation for vital yearnings and a living joy and beauty. That was begun which still is unfinished — the first step towards a conscious consciousness and what shall yet be the divine Ananda.6

In the plant earth-nature achieved a first figure of life, but the creature she made could not possess it, because this first organised life-consciousness had feeling and seeking, woke and slept, hungered and was satisfied, thirsted and drank and grew and flourished, had pleasure of some contacts and suffered from others, but was still externally blind, dumb, deaf, chained to the soil from which it was born, involved in its own nerve and tissue. It could not get out of this primitive formula, could not get behind its nerve-self as does the vital mind of the animal, still less could turn down from above it to know and realise its own motions as does the thinking and observing mind of man and to

6 Not joy or pleasure, but the bliss of existence and its movements from which the world arose.
control them. This was a decisive but an imprisoned gain; for there was still a gross oppression of the original Inconscience which had covered up with the brute phenomenon of Matter and energy of Matter all signs of the Spirit. Nature could no-wise stop here, because she held so much in her that was still occult, potential, unexpressed, unorganised, suppressed, latent; the evolution had perforce to go farther. The animal had to replace the plant at the head and top of Nature.

And what then was gained when Nature passed from the obscurity of the plant kingdom to the awakened sense and desire and emotion and the free mobility of animal life? The gain was liberated sense and feeling and desire and courage and cunning and the contrivance of the objects of desire, passion and action and hunger and battle and conquest and the sex-call and play and pleasure, and all the joy and pain of the conscious living creature. Not only the life of the body which the animal has in common with the plant but a life-mind that appeared for the first time in the earth-story and grew and grew from form to more organised form till it reached in the best the limit of its own formula.

The animal achieved a first form of mind, but could not possess it, because this first organised mind consciousness was enslaved in a narrow scope, tied to the first functionings of the physical body and brain and nerve, tied to serve the physical life and its desires and needs and passions, limited to the insistent uses of the vital urge, to natural longing and feeling and action, bound by its own inferior instrumentation, its spontaneous combinings of association and memory and instinct. It could not get away from them, could not get behind them as man’s intelligence gets behind them to observe them; still less could it turn down on them from above as do human reason and will to control, enlarge, reorder, exceed, sublimate.

Mind emerges out of life in matter; it is incapable of manifesting
directly in the material form. It is there, but it acts mechanically in
the somnambulism of an original force of inconscience and
inertia. This and no more is what we mean by the inconscience of Matter; for although consciousness is there, it is involved, inorganic, mechanical in its action; it supports the works of Force by its inherent presence, but not by its light of active intelligence. This is why material Nature does the works of a supreme and miraculous intelligence and yet there seems to be no intervention of any indwelling Seer or Thinker.

68

Because man is a mental being, he naturally imagines that mind is the one great leader and actor and creator or the indispensable agent in the universe. But this is an error; even for knowledge mind is not the only or the greatest possible instrument, the one aspirant and discoverer. Mind is a clumsy interlude between Nature's vast and precise subconscient action and the vaster infallible superconscient action of the Godhead.

There is nothing mind can do that cannot be better done in the mind's immobility and thought-free stillness.

When mind is still, then Truth gets her chance to be heard in the purity of the silence.

Truth cannot be attained by the mind's thought but only by identity and silent vision. Truth lives in the calm wordless Light of the eternal spaces; she does not intervene in the noise and cackle of logical debate.

Thought in the mind can at most be Truth's brilliant and transparent garment; it is not even her body. Look through the robe, not at it, and you may see some hint of her form. There can be a thought-body of Truth, but that is the spontaneous supramental Thought and Word that leap fully formed out of the Light, not any difficult mental counterfeit and patchwork. The supramental Thought is not a means of arriving at Truth, for Truth in the supermind is self-found or self-existent, but a way of expressing her. It is an arrow from the Light, not a bridge to reach it.
Cease inwardly from thought and word, be motionless within you, look upward into the light and outward into the vast cosmic consciousness that is around you. Be more and more one with the brightness and the vastness. Then will Truth dawn on you from above and flow in on you from all around you.

But only if the mind is no less intense in its purity than its silence. For in an impure mind the silence will soon fill with misleading lights and false voices, the echo or sublimation of its own vain conceits and opinions or the response to its secret pride, vanity, ambition, lust, greed or desire. The Titans and the Demons will speak to it more readily than the divine Voices.

Silence is indispensable, but also there is needed wideness. If the mind is not silent, it cannot receive the lights and voices of the supernal Truth or receiving mixes with them its own flickering tongues and blind pretentious babble. Active, arrogant, noisy, it distorts and disfigures what it receives. If it is not wide, it cannot house the effective power and creative force of the Truth. Some light may play there but it becomes narrow, confined and sterile. Or the force that is descending is cabined and thwarted and withdraws again from this rebellious foreign plane to its vast native heights. Or even if something comes down and remains, it is a pearl in the mire; for no change takes place in the nature or else there is formed only a thin intensity that points narrowly upward to the summits but can hold little and diffuse less upon the world around it.

Reason is a clarified, ordered and organised Ignorance. It is a half-enlightened Ignorance seeking for truth, but a truth which it insists on founding upon the data and postulates of the Ignorance. Reason is not in possession of the Truth, it is a seeker. It is [unable to] discover the Truth or embody it; it leaves Truth covered but rendered into mental representations, a verbal and ideative scheme, an abstract algebra of concepts, a theory of the Ignorance. Sense-evidence is its starting point and it never really gets away from that insecure beginning. Its concepts start from
sense-data and though like a kite it can fly high into an air of abstractions, it is held to the earth of sense by a string of great strength; if that string is broken it drifts lazily in the clouds and always it falls back by natural gravitation to its original earth basis — only so can it receive strength to go farther. Its field is the air and sky of the finite, it cannot ascend into the stratosphere of the spiritual vision, still less can it move at ease in the Infinite.

70

Mind can never be a perfect instrument of knowledge. For even if it could be free from all positive error, even if it could be all intuitive and infallibly intuitive, it could still present and organise only half truths or separated truths and these too not in their own body but in luminous representative figures put together to make an accumulated total or a massed structure.[

71

The office of intellect is not to fathom reality, but to fabricate and preside over action; intellect cannot comprehend life and reality. Intellect (logic) goes round the object, intuition enters into the object; one stops at the [? ], the other enters into the absolute[.]

72

Intuition, — but what do we mean when we speak of intuition? What is its origin, nature, working, and how is it connected with intelligence and sense and instinct, our other ways of knowing, or what is the difference? Is intuition the one means of true and complete knowledge or does it need intelligence, sense, instinct to complete it? Is there a greater power of direct and absolute and complete knowledge of which intuition is only a special or part action, — some first and last potency, the Alpha and Omega
of an all-knowledge, the all-knowledge that we attribute to God or to the Spirit of the universe?

These are the queries it is proposed to answer here; but the answer can come only from intuition itself, from a direct seeing and experience, for if intuition exists, it and its way of working must obviously be something beyond the reasoning intelligence and therefore not entirely seizable by the reasoning intelligence.

I know myself because I am myself, I know the movements of my mind, joy, anger, love, thought, will, because they are myself or parts of myself; I have a direct knowledge of myself, a knowledge by identity. Observation, reasoning there can be as a subsidiary process; but it is not by observation or reasoning that I know them; I feel and know my anger or love as part of myself and have no need to observe or to reason in order to know that I am angry or that I love.

Intuition is a direct knowledge self-existent and independent of means and devices; it is naturally self-existent and founded upon a knowledge by identity; or when it is gained, it is either by identification or by a knowledge arising from some intimate contact made possible by an underlying or occult identity.

Nothing has the value of truth for the supramental if it is only thought or understood with the intelligence. That is a shadow or reflection and shadows can always distort, at best only adumbrate; reflections can always misform or mistranslate and at best have not the truth-substance. It is only when the object is entered into, seen with an inner and surrounding vision, possessed in experience, taken into our living universal & identifying individual consciousness, made one with us in the Truth that is, holds, comprehends, actuates all things, — only then is there the characteristic process of the supermind, the way of directness, the sincerity and power, the magnificence and general wholeness of the gnosis[.]
But what is supermind and where is it in this world of half lights, in which consciousness is a constructor of ideas, images and sensations that at once inform and mislead, representations that are half truths, half misrepresentations, symbols of things, not things in themselves, relative impressions but nothing absolute. Our senses give us the forms of things as they seem to our senses, not as they are; for they would appear quite different to other senses than ours; our mind builds the great mass of its idea of the world and things on this insecure basis, or if it corrects the evidence of the senses, it is in the light of a reason whose conceptions of Time, Space and Substance are equally imperfect, equally relative, empirically valid up to a certain point, but fundamentally dubious and insecure. Is not this the only consciousness possible, or at least the highest of which we are capable and have we any evidence of a higher power of awareness and knowledge or any ground to suppose that there are beings greater than man who possess it? Is not this world and must it not be always a world of Ignorance, knowledge partial at the best, all knowledge here relative, pragmatic, indirect and no knowledge either here or anywhere that can be called supreme, direct or absolute? If absolute knowledge there is it must be the sheer consciousness of the Featureless Infinite, the One Self, the void or formless Spirit, and there can be no other.

I mean by the supermind a power, a level, an organisation of consciousness which is not only above the human mind, but above all that can be called mind,—another higher and wider essence and energy of consciousness altogether. Mind is that which seeks after truth of any kind or of all kinds within its range, labours to know it, attempts to direct and utilise it. But by supermind I mean a divine awareness which inherently possesses truth, knows it by its own intrinsic identity with it and puts it into action or effect spontaneously by its own sovereign power.
without any need of endeavour or labour. Mind even though it seeks after knowledge and can sometimes grasp its figure or touch its shadow, is a product of the cosmic Inconscient or of a Half-Conscience-Ignorance; supermind is an eternal Truth-consciousness, a divine Knowledge self-maintained for ever and luminous in its own right beyond all Ignorance.

The Emergence of the Superman

A god has veiled himself in the earth & mire and beauty and perfection lie unevolved in masses of ordure. This is the play of God with His substance in Matter.

In the atom there is hidden all the will & intelligence & joy that created the universe. In Man they have emerged, but blinking & dazzled by the gleam of their own sunlight, bewildered at themselves & each other. They stumble up against each other, strive & wrestle blindly; for they cannot even [in] the highest man accomplish altogether their own unity & harmony.

An ignorance in which is packed up all knowledge, a mighty inertia in which all cosmic force strives helplessly, an insensibility which conceals the pain and strain of all ecstasy present, but held back, this is the outer face of material Nature and our starting point.

The Spirit awakening out of this veil gradually and with difficulty but inevitably is the secret sense of life. The power to accomplish the perfect awakening against accumulated difficulties, is God's offer to man throughout his cycles.

The perfection & the unity of the divine knowledge, will, delight in the mould of his universalised individuality is the destiny of man, his ascent to Godhead and the unfolding in him of Superman.

Mind evolved is man; supermind unevolved conceals in him the superman.
This is the meaning of our existence here, its futuristic value and inherent trend of power, to rise above ourselves, to grow into gods, to reveal God in a world of material forms and forces.

Earth and conscious life upon earth are not a freak of cosmic Chance, a meaningless accident in the vacant history of nebula and electron and gas and plasm; they are the field of a game of the Gods with the destiny of our souls as the stake of their wager.

To evolve Godhead out of the mud of matter, some divinest consciousness out of a primal inconscience and a struggling ignorance, immortality out of death, undying bliss out of pain and sorrow, the everlasting Truth out of the falsehoods and denials of this relative world is their great and daring gamble.

All life upon earth is the evolution of a divine Spirit that is concealed as by a self-formed mask and robe in the appearance of Matter. Out of that involution it evolves, manifests by a series of ascendent steps its suppressed powers and, once this process has begun, will not cease till the Godhead is manifest in Matter.

Man is a struggling transitional term, an intermediate being who has gathered up into himself the consciousness of the mineral and the vegetable, of the insect and the animal, and is fashioning and refining in the confused twilight and chaos of a half knowledge founded on Ignorance the materials of the god that is to be born.

The instrument of man is mind and thinking and willing mind-force — just as the instrument of the animal is life instinct and feeling and remembering life force and the instrument of the plant and tree existence is the vital push and the dynamism of material energy turning into force of life. As these lower states developed up to a point at which Mind-intelligence could descend into the organised living body and take up the earth-past to mentalise and transform it, so Mind in man has to develop up to a point at which a consciousness greater than Mind can descend into the mind and living body and take up the human material to supramentalise and transform it into godhead. This is man’s rise to the Infinite.
An air from a consciousness greater than mind has already been felt by many of those who have climbed to the human summits and to the glow that has come from above they have given many names, bodhi, intuition, gnosis. But these things are only the faint edge of that greater light thrust into the pallid twilight that we call mind. Only when the lid between mind and supermind has been utterly rent apart and the full power of the sun of a divine Gnosis can pour down—not trickling through mind as in diminished and deflected beams—and transform the whole mind and life and body of the human creature, can man’s labour finish. Then only shall begin the divine play and the free outpouring of the liberated self-creating Spirit.

To rise into this greater consciousness above our mental level of humanity as man has risen above the level of the life-mind of the beast, to grow from mind into supermind, from twilight into light, from the mind’s half-consciousness into what is now to us superconscient, from a narrow imprisoned ego into the transcendent and universalised individual, from a struggling half effective into a throned and master power, from little transient joys and sorrows into an unalloyed divine delight, this is the goal of our journey, the secret of our struggle.

This is our way of emergence from the now dark riddle of the earth and unsolved problem of human life. If there were not this secret sense in all we are and do, there would be no significance in the material world and no justification for our earth-existence.

A gnostic superman is the future master of the earth and rescuer of the divine meaning out of the ambiguous terms of this great world-enigma.

All that baffles us in existence can find its solution, if we can read it in the light of intention that comes from its source. The original Light points us from our preoccupation with our roundabout and puzzling course to the revealing significance of its aim; for the world’s source and origin and its aim are one.
The Cause and Fount of all things is the Divine and the end and aim of all things is the Divine. The finite in Time reveals its own deep and abiding sense when it opens to the Eternal and throws itself into the Infinite.

The only true knowledge — for all the rest is either false or only true in a limited field, half-true and therefore, from the vision of the whole, false — is that which reads everything in the sense and light of the Divine. If man would open himself to the Divine Light, he would begin at last to know; but he prefers always to read everything in the light of man’s consciousness, man’s sense, man’s aims and hopes in his little half lit circle.

But man was not the beginning of the manifested universe or even of the earth-cycle, so also he is not its end and fulfilment. There was much before he appeared; there will be much after he has gone — or fallen into a subordinate place.

Human consciousness is a half term in earth nature’s climb from the electron and atom, gas and metal through the vegetable and animal and human formulas to the god and Titan and through the god to the Divine. It is not in the light of the realised alone that we should read the earth-riddle; it is in the light of the unrealised that we shall understand the realised and know why all was and to what all was moving in Nature.

At present what we know best is man and mind and what mind and its several senses see or infer about the universe. But mind is not the highest possible instrument and mental man is not the last creation possible to the capacities of creative evolution in the material universe.

There is indeed the real man as well as this that is apparent. The apparent is this imperfect and struggling humanity, the real is the Purusha, the conscious being within us. The Conscious Being within us, one with the Being in whom we live and move, is indeed the cause and beginning and the end and aim of existence.

But our humanity is only a transitory phase of the Conscious Being within us.

Man is not final.
The transition from manhood to supermanhood is, in one sense, a self-exceeding, a ceasing to be what we now are in order to become something else or more. In another sense it is a self-becoming, a flowering out of something concealed by our present state, a latent godhead that already is and always was our true being.

Supermanhood is for us a self-exceeding because man, pragmatically and to his own surface awareness, is a small, confused, limited, still ignorant formation of evolutionary Nature,—if supermanhood is intended, then either he has himself to become superman or, if he cannot or will not achieve it, he must make way for some creature greater than he who will have both the will and the power.

But again supermanhood is at bottom a self-becoming because what we now call ourselves is only the surface man, a thinking and living body; but this [is] only the top of a wave, not the whole sea that secretly we are. All that makes supermanhood is there at least in material in our secret depths and on our still more occult height; what in outward fact, in appearance, in present self-awareness man is not but must become, is already there within him; he has only to find himself in order to become that greater self and nature.

Man [is a] transitional being, not the final end of the evolution and the crown of terrestrial existence.

This ignorant, imperfect and divided being, with his labouring uncertain thought and half-successful will, this toiling and fluctuating experiment, this field of the attempt at emergence of a thousand things that are striving to be, is no consummation of the struggle of cosmic Force; he is only a laboratory in which Nature seeks for its own concealed secret, makes tentative efforts at what she has been missioned to achieve.
As man arose out of the animal, so out of man superman shall come.

81

Man is a transitional being; he is not final. As it did not begin with him, neither does it end with him. He is not its evident crown, not its highest issue, not the last clear sum of Nature. Nature has not brought out in man her highest possibilities; she has not reached in him the supreme heights of consciousness and being; as there was before him the infrahuman, the insect and animal, so there shall be after him the superhuman, the superman.

Man may himself become the superman, he may become all that he is not now; but for that he must exceed himself. It is not by clinging to his present imperfect consciousness that he can take the next step in the evolution. He must discover and release the spiritual godhead within him, realise his divine possibilities, be himself the giant potential something, the divine someone who has been struggling into emergence out of the original plasm that imprisoned it since began the mystery of terrestrial Nature.

82

Man cannot be final, he is a transitional being. This is very clear from the incompleteness and imperfection of all his powers of consciousness; he can only arrive at some limited form of temporary and unstable perfection by much labour and struggle; and yet the search for perfection is ingrained in his nature. There is something that he is not yet which he has to be; he is reaching always towards the something yet unrealised; his whole life and nature is a preparation, an endeavour of Nature towards what is beyond him.

The human consciousness is limited in every direction; it does not know itself, it does not know the world around it, it does not know the origin and meaning and use of its existence.
But it strives always to know, to find the truth of its being, the right use of its life, the end towards which Nature in him is tending; this it does with a seeking and blundering movement; man’s consciousness is an ignorance struggling towards knowledge; it is a weakness training itself for power; it is a thing of pleasure and suffering that tries to lay hands on the true delight of existence.

All that we see in us and around us in this material world is a mystery-play of the Eternal and Infinite; it is the large total and the curiously variable detail of steps and circumstances in a self-discovery or self-unfolding of a Divinity who has hidden his real from his manifested self in the vast black disguise of the inconscience of Nature.

This is the constant miracle that is the key to the meaning of existence, — the miracle of the birth and growth of life and consciousness in the inanimation and inconscience of the material universe.

The birth and growth of consciousness is the whole sense of evolution. For evolution is not in its inner and essential character a development of more and more organised forms of Matter. This development is only an outer instrumentation for the evolution of life and of consciousness in life. That again in its deepest inmost sense is a growth embodying the slow self-discovery and self-revelation of a soul or spirit in a form of living matter.

The evolution has been an ascension starting from forms that seem to be inanimate and inconscient objects, for in them the spirit in things is asleep, through a leisurely waking in plant and animal till it reached with difficulty a beginning of self-awareness in man the mental being, the first and only speaking, thinking, reasoning creature. But there is no ground for the idea cherished by this imperfect human being that he is the summit and last word of the evolution. Humanity is one step in the destiny of the evolving spirit, the last before it assumes something of its own divinity delivered and apparent; his imperfect life and consciousness must develop itself into the type of the fully conscious being, after man or out of him must be born the superman.
This consummation can only take place by an evolution of the consciousness of the individual and humanity beyond its present stage of development; it can take place only if man is ready to take the turn towards which Nature has been slowly leading him, to discover himself, to know himself as soul and spirit, to see and lay firm hold on the Reality behind world and life and things after which he has been seeking through the ages. Nature's first evolution has been an evolution of Matter, of physical objects, of the stage, scenery, external conditions and instruments of the drama of an evolving conscious Life in Matter. In life itself she has been content at first to organise a physicality, an externality of life; the evolution of the body has been the sign, the instrument, the apparent cause of the evolution of consciousness. Even when she has arrived at the evolution of Mind, the mind of a humanity which is capable not only of knowing outwardly the external world but of going within itself, of knowing itself, of knowing the secret things, powers, forces which are behind itself and behind the works of a surface external Nature, still she has been most careful to organise a surface Mind dealing with surface and external things and an organisation of personality which is superficial and not the whole of ourselves, a wave only of the ocean of our hidden being, our secret reality. To build an ego which will deal with material life and nature as its user but also as its subject, a life that is bound by matter, a mind that is bound by both matter and life has been her main preoccupation. But still the evolution of consciousness is the real and central fact which gives a significance otherwise altogether lacking to the mechanical structure of the universe. Man is here not merely to utilise his world for the service of his individual and collective ego; he is here as a medium in which the Spirit within, the secret growing Consciousness can evolve farther its self-manifestation, arrive from a partial to a complete consciousness and, since life itself is there only as a means of this evolution and an image of it, at a complete and perfect individual and social life. If the psychological truth of our being is the real and central truth, more central and important than the physical, this
must be its true nature, a conscious being growing towards its own completeness of consciousness and growing too towards its expression and formation in a complete individual and social life.
Section Two

Psychology

The Science of Consciousness
The Problem of Consciousness

The Triple Enigma

Existence, consciousness and the significance of our conscious being,—a triple enigma confronts us when we look at them to discover their origin, foundations, nature, their innermost secret. We begin with a riddle, we end with a mystery.

Existence itself is the first riddle. What it is we do not know, we are ignorant how it came to be at all, we cannot say whether it is an eternal fact or a temporary phenomenon. It may be only an appearance or it may be real, not in itself but as a manifestation of some hidden Reality; but then of what is it the manifestation and how came it into being or why had it to be?

Consciousness of existence is a second insoluble miracle. It seems not to have been and now is and it may be that some day it will not be; yet it is a premier fact and without it being would not know of its own existence. Things might exist, but only as a useless encumbrance of a meaningless space,—consciousness makes being self-aware, gives it a significance. But what then is consciousness? Is it something in the very grain of being or an unstable result or fortuitous accident? To whom does it belong? to the world as a whole? or is it peculiar to individual being? Or has it come from elsewhere into this inanimate and inconscient universe? To what end this entry?

The significance of our conscious being in an inconscient material world is the last and worst enigma. What is the sense and justification of the individual, his consciousness, his feeling of self, his personality? Is our individuality real or apparent, temporary or permanent, a minor circumstance or a central
secret of the whole? Has it a meaning in the universe or in something beyond the universe? or is it only a chance outburst of Nature with no sense in it or any but a mechanical purpose?

* 

All these problems arise in our consciousness and in our consciousness alone can be found their solution— or to it or through it perhaps from a greater consciousness the solution must come. On the nature and validity of our consciousness depends the nature and validity of the discovery we shall make or the conclusions to which we can come. On the power of our consciousness depends the possibility or impossibility of putting into the terms of life the solutions our knowledge discovers. But most of all the appearance and development of consciousness in the inconscient world is the decisive factor, the one thing that gives its existence a light of meaning, a possibility of purpose, a hope of fulfilment and the soul’s self-finding. To know, then, the nature of consciousness, its process, its birth, growth and destiny is for us a study of supreme importance.

84

All the problem of existence turns around three things, the nature of being, the nature of consciousness and the secret of the dynamics, the energy of existence by which being and consciousness find each other and manifest what is within them. If we can discover these three things, all is known which we fundamentally need to know; the rest is application and process and consequence.

The problem of consciousness is the central problem; for it links the other two together and creates their riddle. It is consciousness that raises the problem it has to solve; without it there would be no riddle and no solution. Being and its energy would then fulfil themselves in form and motion and in cessation of form and motion without any self-awareness and without any enjoyment or fruition of their form and motion.
Existence would be a fact without significance, the universe an inanimate machine turning for ever — or for a time, — without any reason or issue in its turning. For it to have any significance there must be either a Mind or some other kind of Awareness that observes it, originates it perhaps, has joy in its turning, works out something by the turning of the machine for its own satisfaction or dissatisfaction; or there must be a consciousness that emerges by the turning and reveals being and energy to themselves and leads them to some kind of fulfilment. Even if it is only a temporary consciousness that emerges, yet that must be the one significant fact of being, the one thing that lights up its movements, makes it aware of itself, raises it to something that is more than a mere dead or blank self-existence, a One or a Many that is yet worth no more than a zero.

Even if what fundamentally is in being, is not consciousness but a superconscience, yet that must be one supreme kind of self-awareness, if not also all-awareness; for otherwise there would be no difference between superconscience and inconscience; the two would be only top-side and bottom-side of the same blank, yet mysteriously but vainly fruitful reality.

In the ancient tradition eternal and infinite Being and Consciousness carry in them as the result of their oneness or coexistence an eternal significance of Bliss, Ananda. If we suppose Being-Consciousness to carry in them an eternal and infinite energy that creates, as we say, expresses, as the Sanskrit term better puts it, the universe, then the bliss of eternal conscious being would contain in itself a bliss of eternal energy of consciousness and being finding itself in the joy of self-expression, self-manifestation, self-creation. That would be a sufficient explanation of the appearance of a phenomenal universe, there is in fact no other that is satisfactory. These then are the three or the four terms underlying all the secret of existence, — Being, Consciousness-Energy, Bliss of being, Ananda.

It would not materially affect the fundamental satisfactoriness of this explanation that the world we live in is not a world of bliss, not a world of consciousness, — though it is in its evident appearance, a world of being and of energy of being, that it is in
its phenomenal basis inconscient and works itself out through process and labour and, when consciousness appears, through joy of being but also through pain of being. If the eternal creative Energy takes joy in that, has the Ananda of it (and without consciousness there can be no joy or Ananda), as a poet in the creation of his tragedy or comedy, then that would be a sufficient explanation of the existence of this universe, though we would still have to seek for its significance, the reason of this choice of pain and labour.

Consciousness then is the centre of the riddle. If we know what is Consciousness, where its action begins and ends — if it has a beginning and an ending, what is its process and the significance of its temporal appearance and action, we shall then be able to look deeply into being and its energy and understand and solve all their enigma.

But here in our world of Matter the original and fundamental phenomenon we meet everywhere is a universal Inconscience, Consciousness appears to come in as only an incident, a development, a strange consequence of some ill-understood operations of Energy in inconscient Matter. It arises out of an original Inconscience, it dissolves or sinks back into the Inconscience. Once it has appeared it persists indeed but as a general phenomenon precariously manifested in individual living beings. It has the seeming either of an uncertain freak of inconscient Nature, — a disease some would conjecture, a phosphorescence playing upon the stagnant waters of inconscient being, active at certain points of animation, or a guest in a world in which it is alien, a foreign resident with difficulty able to maintain itself in a hardly amicable environment and atmosphere.

According to the materialist hypothesis consciousness must be a result of energy in Matter; it is Matter's reaction or reflex to itself in itself, a response of organised inconscient chemical substance to touches upon it, a record of which that inconscient substance through some sensitiveness of cell and nerve becomes
inexplicably aware. But such an explanation may account, — if we admit this impossible magic of the conscious response of an inconscient to the inconscient, — for sense and reflex action [yet] becomes absurd if we try to explain by it thought and will, the imagination of the poet, the attention of the scientist, the reasoning of the philosopher. Call it mechanical cerebration, if you will, but no mere mechanism of grey stuff of brain can explain these things; a gland cannot write Hamlet or pulp of brain work out a system of metaphysics. There is no parity, kinship or visible equation between the alleged cause or agent on the one side and on the other the effect and its observable process. There is a gulf here that cannot be bridged by any stress of forcible affirmation or crossed by any stride of inference or violent leap of argumentative reason. Consciousness and an inconscient substance may be connected, may interpenetrate, may act on each other, but they are and remain things opposite, incommensurate with each other, fundamentally diverse. An observing and active consciousness emerging as a character of an eternal Inconscience is a self-contradictory affirmation, an unintelligible phenomenon, and the contradiction must be healed or explained before this affirmation can be accepted. But it cannot be healed unless either the Inconscient has a latent power for consciousness — and then its inconscience is phenomenal only, not fundamental, — or else is the veil of a Consciousness which emerges out of a state of involution which appears to us as an inconscience.

There is no doubt a connection and interdependence between consciousness and the inconscient substance in which it resides and through which it seems to operate. Consciousness depends upon the body and its functionings, on the brain, nerves, gland-action, right physiological working, for its own firm state and action. It uses them as its instruments and, if they are injured or unable to act, the action of the consciousness may also be in part or whole impaired, impeded or suspended. But this does not prove that the action of consciousness is an action of the body and nothing else. There is an instrumentation and if the instrument is impaired, the user of the instrument can no longer manifest himself rightly through it; if it is destroyed, he
cannot operate any longer unless or until he can get another instrument. This then has to be seen whether the phenomena of consciousness are such that they make it necessary to suppose such a use or instrumentation of the body.

If so then either there must be a conscious being in us that is other than the body or else a conscious Energy that thinks, senses, observes, acts intelligently through the physical instrument. This is what we actually observe in our experience of ourselves that there is such a being or else such an energy at work in us and this self-experience is surely as valid, as binding as the accompanying experience of an inconscient substance or building of inconscient Matter which is its field and habitat. Both sides of the phenomenon must be given their value; to reject Matter as an illusion of Consciousness or Consciousness as a freak or disease of Matter are equally one-eyed views which miss the true problem and are not likely to lead to a satisfying solution.

It is certainly possible, prima facie, that Consciousness may be a subordinate phenomenon dependent on Matter or, more accurately, on the Energy that formulates Matter. Our need then is to discover its exact nature, origin, function in a material world and the utmost limit of its possibilities for the human being; for to man matter is only a basis of his life, a material of his works, an opportunity; what is really important to him is consciousness, for it is his consciousness and use of consciousness that gives him his significance and importance to himself and the world; without it he would be nothing and mean nothing.

At any rate this is the fact that faces us, that there is an apparent Energy that seems to have built up this world which first in the animal and then more amply in man has become and works as a conscious Energy and that this transformation is the crucial and capital fact of our universe. It may well be that in it lies the secret of the significance of that universe. It may turn out on deeper enquiry that a Conscious Energy has created as its field an inconscient substance and is veiled in its creation and emerges in it, a Power, a Godhead releasing itself slowly and with difficulty out of its self-made chrysalis of material Inconscience.
The Problem of Consciousness

It is not sufficient to examine the material, the physiological processes accompanying the functioning of consciousness and attempt to explain the functioning by its physical processes. This leaves consciousness itself unexplained; if it accounts to some extent, but imperfectly, for sense phenomena or mechanical thinking, it does not account in the least for the most important powers of our conscious energy; it does not account for reason, understanding, will, creative thought, conscious selection, the conscious intellectual and spiritual action and self-development of the human being. Yet these are of capital importance, for it is here that consciousness begins to unfold itself out of its chrysalis or matrix of inconscience and a half conscious first working and reveal its true nature. Here consciousness acts in its own right, in its own field and not as a product of the body. To see how the body uses consciousness may be within limits a fruitful science, but it is more important to see how consciousness uses the body and still more important to see how it evolves and uses its own powers. The physiological study of the phenomenon of consciousness is only a side-issue; the psychological study of it independent of all reference to the body except as an instrument is the fruitful line of inquiry. A body using consciousness is the first outward physical fact of our existence, the first step of our evolution; a consciousness using a body is its inner spiritual reality, it is what we have become by our evolution and more and more completely are.

What Is Consciousness?

Consciousness — but what is consciousness? A word only conveniently ticketing a class of natural phenomena or a fundamental reality of existence?

Apparently a phenomenon which has only a small range intervening in an immense mass of things inconscient and without significance, consciousness alone gives a value to the universe. It
seems to have taken no part in the creation of the universe; it was not there in the beginning or even during the greater part of the history of the earth; it may not be there at its end. In the middle it plays a great role in the life of animal and man, but its action is crude and ill-developed in the animal, imperfect in the human creature. Its evolution wears the character of an episode in the long history of an inconscient world, a chapter that began some time ago, but one knows not why it intervened at all or how it will end or whether its appearance has any meaning, whether its developing importance has an accidental and meaningless or a purposeful and revelatory character. It may be a freak of creative Chance or it may be or may carry in itself the whole meaning of the world-drama.

In an inconscient universe, in a Nature or the working of an Energy which is fundamentally material, the emergence [of] Consciousness has at first the air of a surprising, a contradictory, an impossible event. For in such a world, in the working of such a Nature or Energy, how could it ever come into existence? Either there is no real consciousness, only an action of Matter or unconscious Energy which takes this inexplicable and deceptive form, or Nature or Energy is not fundamentally inconscient. Consciousness was always a possibility which at a certain stage chanced or was bound to take place, or it was a latent power that has become manifest. Or even it may be all Nature is really conscious and it is we who foist inconscience upon her because we are limited to a certain range and character of consciousness and cannot communicate with her other ranges or even detect their existence.

It has been held by a certain opinion that consciousness in itself does not exist, there are only phenomena of reactions of Matter to Matter or of Energy in Matter to Energy in Matter to which by generalisation we give the name. There is no person who is conscious, thinks, speaks, perceives, wills, acts; it is an organised body in which certain chemical, molecular, cellular, glandular and nerve activities take place and certain material results and reactions of these activities take place in the brain which take the form of these phenomena. It is the
body that thinks, perceives, wills, speaks, acts; it is Matter that goes through these operations and becomes aware of them; it may be said that brain-matter makes a record or notation of these actions and this notation is consciousness and this record is memory. There is nothing in the world except Matter and the operations of Matter.

This theory arose when physical Science concentrated on the operations of Matter, saw only Matter and energy of Matter everywhere; it persists even after that seeing of things has been severely shaken. For now we are driven to see and say that there is no such thing as Matter in itself; what we call Matter is only a mass of phenomena of Energy, events of energy, which our senses regard as objects and our minds classify under the general name of Matter. But we can still hold that all phenomena are phenomena of Energy acting in the forms or sensible events which we call Matter and the phenomena of consciousness are of that character. There is nothing else to it, nothing but the mobile and executive Energy, Nature, Prakriti; there is no soul, no Purusha. Consciousness would still be a general name for a brain-record and notation of these events of material Energy and this will still be the true character of thought, perception, will, speech, act. All these events are separate phenomena which may act and react on each other or group themselves together, but they are not the result or manifestations of any one general force or power of being that we can call Consciousness.

Consciousness, — but what is consciousness?

And first of all we have to face the possibility that there is no such thing. For many hold that the word is an unreal generalisation invented to cover a class of material phenomena having their origin in Matter and material in their nature and essence, an operation of Matter on Matter and in Matter. Thoughts are only vibrations of the grey matter of the brain; they are not something other [than] that or capable of existing beyond the material plane; they cannot exist independently of the brain; brain is not
their instrument of expression or manifestation; they are [its] instrument made of its substance, dependent on [its] substance, inexistent without it. Mind is an action of Matter, not a separate power or force; there is nothing in it superior to the physicality of the body; it exists by the body and as a part of its activity, lasts along with it, dies with it. Mind is a product of gases, some operation of Nature’s chemistry, glandular influences, nervous stimuluses; it is matter and records the operations of Matter.

But why then this appearance of mentality, of consciousness, of a conscious being? That too is only a trick of Matter. They are reflexes and reactions to the contacts of things outside, to other material objects, bodies, movements, forces. Sense and sensation are the reply of the nerves to stimulus of external and material things or to internal stimuli that are still material. To the experience of the body the result of these, recoils, reflexes, reactions, may seem mental, but that cannot alter the fact that they are material products of the workings of Matter.

Well, be it so; but still this mentality creates an awareness of self and things and the movements of self and things, even if both be only a body and so many other bodies, and it is difficult to describe awareness as an inconscient movement or condition or as the inconscient seeming to be conscious. Evidently we are in face of a general sophism invented by specialists of a limited field of data, the data of inconscient Matter, who are determined to force everything into its characteristic formulas and refuse to admit everything else. We must at least recover the right to see this awareness and its movements as they are or as they present themselves to us and see how far it leads us and whether indeed, even if it occurs in matter and the body, it does not lead us to something other than the body and other than Matter. The materialist contention that consciousness is not a separate power or force or manifestation of energy like electricity or magnetism or steam, but only a name for a particular bundle of brain phenomena, cannot hide the startling fact that inconscient and insentient Matter has become sentient and conscient even if it be only at points, in jets, in small masses.

This awareness has created at least the appearance of a
sentient and conscient being who not only becomes relatively aware of self and things, but can study them, discover their nature and process, determine and develop the possibilities of his own consciousness and the possibilities of the world's forces and processes, can will and can create, can ponder and philosophise, can write poetry and create works of art, can use [?] to modify and alter the world around him and make for himself a different life-environment, can look beyond Matter, can tend towards the heights of consciousness not yet developed, can envisage the Superconscient. If the consciousness that can do all this is not a force, a power in itself, it at least looks strangely like it. And we have the right, at least hypothetically, to study it as such a power or force and find out how far that leads us.

It may even lead us to the discovery of a Reality greater than the world of Matter or of Energy building up shapes of Matter and movements in Matter. It may take us beyond phenomena and appearances to the truth of things and to something that is the origin of all that seems to be.

* *

At the other extreme of human mentality we meet a similar and more devastating denial. Consciousness has no real existence; or, so far as it exists at all, it is as a dynamic Power, a creator of illusions. There is nothing sound or real in what it builds; there is nothing true in what it sees; the world it shows us is [an] impossible chimera, a mass of figments and falsehoods. The sole consciousness that is true is the self-awareness of some absolute Silence, a spaceless immobile Infinite, a timeless featureless Eternity. Or, as the materialist sees only a bundle of phenomena material and dependent on Matter or a fortuitous result of material operations, so the Nihilistic Buddhist sees only a bundle of associations, sanskaras, which stuck together produce the false appearance of a continuity of concrete phenomena or a stream of momentary perceptions giving the impression of a false self and coherent world, a coherent personality, but if the bundle is dissolved, if the stream ceases to flow, all dissolves and
collapses and shows the empty Nothingness which is the only eternal truth and the sole eternal reality. This superconscient Nothingness has no need of consciousness [for] the greatness of its emptiness or its everlasting peace of unconscious bliss. To return to Nothingness is the only use or meaning of existence.

Here too we seem to be in front of [the] sophism of a specialist seizing the sole salient and striking side, the one prominent aspect of Truth in which he is versed putting aside all the rest as inconsistent or invalid. After all the world exists and is too persistent and effective and solid a phenomenon to be put aside or merely whistled off the field with an airy “It is not”; — a mirage is ineffectual and recedes or fades if it is touched, an illusion dissolves if revealed but this is stupendously effective, overwhelmingly persistent and we have to sound all its possibilities before dismissing it as something vain and trifling. World-consciousness may be only one aspect of our being, but it is a big and momentous aspect and it too should be given its full chance of justifying itself before it is ruled out of court. The eternal reality of a pure immobile existence and its self-awareness is also a truth of our being. But it is not impossible that these are two aspects of one Reality and not so incompatible as the metaphysical logician imagines. This is what we propose to do integrally and with a full and exhaustive inquiry before we decide either way. The chances are that so enormous a thing as this world is something more than an astonishing chimera. The chances are that when two such great aspects of existence confront each other, there is a connection somewhere, a reconciliation of their contraries. It is possible that both are aspects, static and dynamic, of some absolute Reality from which both have drawn their own reality and in which they have their true and inevitable place.

*

In any case consciousness is the one thing by which we can consider or decide the question at all. It is the one thing by which we know at all that world exists or can inquire into its
truth and its meaning. If consciousness has no reality and no value, then there is nothing by which we can know the truth,—one explanation of things has then as little value as the other, neither can be claimed as the truth. The consciousness by which we affirm the featureless sole Reality can be as fallacious as that by which we affirm our individual self and the universe.

If consciousness is the self-awareness of the eternal Existence, it can only be this self-awareness seeing its own power and the works of its power as a real world. If consciousness is a creation of the evolution, it is also the one thing by which it receives some value, the one thing by which its values can be reckoned, its [. . . ], its one central and essential value. It is not by the development of forms that evolution reaches its height, but by the evolution of consciousness. The degree of consciousness is the degree of evolution; the extent to which consciousness has developed its powers, range, height, its fulness of vision and self-vision, is the measure of the evolution’s development of its work and aim, its progress towards its goal, if goal indeed it has and is not the incoherent working out of an accidental Chance. Indeed, if we look at the way in which the Inconscient has devised the world and the sequences by which it has arrived at intelligence, we have some reason [to think] that it is a secret Consciousness which has made this world and under the mask of inconscience has emerged as a slow process of an Ignorance developing Knowledge.

If so, it may well be that it is the self-awareness of the [eternal Existence] that is working out in the formula of inconscient Matter and ignorant Life and half-awakened Mind its own self-manifestation in the material universe.

But what is consciousness and what its relation to existence? How and why did it come into being in an inconscient universe, a universe which even if it originated by an inexplicable chance, has assumed the proportions of a huge and complex inexorable mechanism repeating the same processes through the
aeons without respite or cessation? By what spiritual or mechanical necessity? by what mechanical chance or accidental process of Energy? To what end or purpose, if any purpose there can be in an inconscient mechanism of brute Necessity or inexplicably organised Chance or any end in a movement which never had any reason for beginning? Does consciousness exist or is it a fortuitous illusion? Who or what is it that becomes conscious in the animal and in the body of the human being?

Three possible solutions. Consciousness has not come into being but was and is always there, a fundamental power of existence, latent or involved or concealed from our mind and sense even in what we call inanimate and unconscious things. It has not come into existence but has emerged from existence; involved it has evolved in the general evolutionary process. Or consciousness is only a phenomenon, a surprising result of certain inconscient processes of Nature, unintentional but actual, unnecessary and accidental or else somehow inevitable as an output of chemical and other physical energies which could not help imposing itself at a certain point of their activity in the natural course of things. It did not exist before that point was reached; when another point has been reached it may go out of existence. Or again the world is a creation of an extracosmic or immanent conscious Being personal or impersonal who has either put his consciousness or a consciousness resembling his into his mechanical creation to be an element there or else has infused it from within into the mechanical self-expression in which he has chosen to dwell as its upholder, inspirer, inhabitant.

What is meant by consciousness? what is this phenomenon which seems to have so small a part in the vast inconscient mass of things and is yet the sole element here that can give any value to the universe?

And to come to the heart of the difficulty — is it indeed only a phenomenon, an appearance that has emerged in the course of the workings of an Energy which was, is and will always remain inconscient? Or is it something fundamental, an inherent reality
or a latent character or power of that Energy and bound to emerge at some time once it had begun its workings?

88

It is to a mass of ill-connected and ill-understood phenomena that we give this name of consciousness; when these are at work we say that a man or animal is conscious, when they are suspended we say that he or it is unconscious; where they are absent, as in a tree, we suppose the object, even if it has life, to be inconscient by its very nature, incapable of sensation no less than empty of thought and will. Where life is not, inconscience seems to us a still more self-evident character of the thing or being. Man alone is fully conscious, for he alone is aware of himself, reflective on things, in full possession of mental capacities and their aware and observant use. Mind and consciousness are almost synonymous to our ordinary notions; where consciousness is not mentalised, we find it difficult to recognise its presence, hardly possible to follow its movements; even in the animal we are apt to regard it as reflex movement not aware of itself, undeveloped, primitive.

89

All that exists or can exist in this or any other universe can be rendered into terms of consciousness; there is nothing that cannot be known. This knowing need not be always a mental knowledge. For the greater part of existence is either above or below mind, and mind can know only indirectly what is above or what is below it. But the one true and complete way of knowing is by direct knowledge.

All can be rendered into terms of consciousness because all is either a creation of consciousness or else one of its forms. All exists in an infinite conscious existence and is a part or a form of it. In proportion as one can share directly or indirectly, completely or incompletely in the eternal awareness of this Infinite, or momentarily contact or enter into it, or formulate some
superior or inferior power of its consciousness or knowledge, one can know what it knows, in part or whole, by a direct knowing or an indirect coming to knowledge. A conscious, half conscious or subconscious participation in the awareness of the Infinite is the basis of all knowledge.

All things are inhabited by this consciousness, even the things that seem to us inconscient and the consciousness in one form can communicate with or contact the consciousness in another or else penetrate or contain or identify with it. This in one form or another is the true process of all knowledge; the rest is ignorant appearance.

All things are one self; it is the one Knower who knows himself everywhere, from one centre or another in the multiplicity of his play. Otherwise no knowledge would be possible.

The Secret below the Surface

All life, all existence is an enigma to the human mind, because the mind is a light which sees only the surfaces of things or at most a little below the surface and is moreover limited by its own circumscribed area of vision. It cannot see what is beyond those limits and yet there are an infinity of things beyond its circle. It cannot see what is above, it cannot see what is within, it cannot see what is below. But what is on the surface is never the truth of things; the surface presents us only with facts not with truths, with phenomena not with realities, with imperfect indications, not with the realisation of things in themselves. The secret, the truth, the reality of things is above, within, below, it is not on their surface.

There is a meaning in the universe, an intention in cosmic existence; there is a significance of the individual, his life is a sign and has a purpose.
The true truth of things is not apparent on the surface, it is something hidden. Truth is not obvious, it comes always as a discovery. Life is the working out of a secret, the process and progress of a mystery; we too are not what we seem to be, we have to find and become ourself.

What we seem to be is a thinking human animal. What we are and have to become is God; the secret purpose of our existence here is to find the occult Reality of ourselves and the world, to become Divine.

Our existence in the world has a reality which is other than that which strikes our mind and senses on the surface. It contains a secret, a mystery which we have to discover, for through that discovery we must move both to the realisation of our self and spirit and the perfection and fulfilment of our life in Nature.

Our life is not an illusion nor a delirium nor is Nature a Maya, a fabricator of dreams or a dealer in vanities as certain religions would have it nor is one the outcome of a blind Force or the trick [of] a blind self-regulating Chance, the other an unconscious Power as it must be if the materialists’ dogma were true. Our life is neither a freak of God nor a freak of Nature; it has a conscious plan although a secret plan, a significance although an occult and mystic significance.

The plan, the significance are secret and mysterious to us because we live on the surface of ourselves and things and are not in touch with either their core or their height or depths. Science on one side, Religion and Philosophy on the other try to arrive at the hidden Truth, but each touches and only just touches one end of it and refuses to go farther and discover the other end or the link and reconciling relation between these two poles of existence.

It is said in the Veda of Agni, the flame of the creative Will and Force, that he hides his two extremities; only his middle is patent and visible. The head of Agni is occult in some superconscient height, his feet are plunged in the abyss of the
material Inconscience. Consciousness emerging in the universe of life and mind is the bridge and link between the two poles. But our human consciousness is a term in the chain which is aware only of itself and sees all the rest in its own terms; it cannot identify itself with the other links and misses their significance and their purpose. It stands on the middle of the bridge looking all around it, but the bridgeheads are to its sight invisible. It cannot see what is there, but only speculate, infer or conjecture.

Science questing with its measuring rod of empirical experiment begins to have a dark glimpse of the Inconscient; it knows the universe as an organised freak that has emerged from the material Inconscience and will go back to its source. Religion and Philosophy rise on the wings of spiritual experience or in a balloon of metaphysical logic into some stratosphere of super-conscious Reality, they seem to discover a God or Self or Spirit or Absolute and try to map it with the intellect or to turn it into a dynamic spiritual formula. But they are unable to reconcile these three terms of being; their physical experiments or their spiritual experiences are valid, but each has hold of only one end of the enigma.

Science has discovered Evolution; Religion and Philosophy have discovered something of that which is involved and evolves in this cosmic Existence. But the two discoveries have refused to shed light upon each other; each has shut itself up in its own formulas. This is because each is a creation and activity of Mind, Science of the concretising experimental mind, Philosophy of the abstracting intellectual mind, Religion of the dynamic spiritual mind. But Mind is bound always by its partial formulations of the Truth; Mind grasps formulas or images but is itself grasped by its own creations, it cannot get free from them or go beyond them. But the mind’s concepts and formulas are only fragmentary representations of Truth or pointers or abstract schemas and images, not her very self and reality. Either a deeper inner soul-vision or a higher overmental or supramental consciousness is needed to discover Truth in her very face and body.
Then only can both ends of the riddle be firmly seized and connected together, the whole of existence seen in one gaze and life compelled to unmask its fathomless significance.

A mysterious something involved in Matter, concealed by it, evolving from it but in a material house or figure, striving to reveal itself in life and mind, but concealed by its forms of life, concealed by its forms of mind, shooting out from them glimpses of itself, glimpses that hint but do not elucidate,—this is what we can see, and we see no more; the rest is speculation and conjecture. Is this something native to Matter, born in it and destined to die in it? Or is it an alien, a temporary visitor? Is Matter itself only a mask of it, a phenomenon of Energy, as it now more and more seems to be? Energy itself is a movement, a force of concealed Consciousness, Consciousness the sign of a hidden spiritual Being. But if so, what possible significance or purpose can there be in this involution, this material self-concealment and self-imprisonment, this slow tormented emergence of the Spirit?

Two lines of enquiry seem to give, though imperfectly and in opposition, a positive base for a reply to the question and the riddle,—the experiments of the scientist and the experience of the mystic.
Consciousness and the Inconscient

Inconscience

93

World and life can be looked at from one of two opposite vision-bases — observed in the light of the knowledge that looks below and sees as the foundation of things the Inconscient from which our physical birth took its rise or experienced in the light of the knowledge that looks above and draws the radiations it throws upon all around it from the Superconscient which is our soul’s source. These two conflicting light-streams — which yet at their extreme points seem almost to meet or at least touch the same mystery — yet shed at first opposite values on the phenomenon of conscious life in matter and illumine in contrary senses the destiny of man and his place in world-existence; for in the light from above it assumes a supreme significance, in the light from below a supreme insignificance.

For if we look from one side, consciousness appears as a circumstance, a thing secondary or even accidental, a little flickering temporary uncertain light in a vast darkness of inconscient world-systems; if we look from the other it is the slowly delivered but not yet perfectly released blaze of that which supported all along this seemingly inconscient creation, subtly concealed in its very cells, molecules, atoms, electrons or whatever still more infinitesimal whorls of motional force-substance have been made its base. Either then consciousness is a perishable jet of flame shooting up out of the slime of this obscure teeming morass we call Matter, a strange inexplicable temporary freak sprung from gas and plasm, chromosome and gene, gland and hormone — we know not well how even when we have found the process,
and know not at all why and can never know and hardly need to know, since the whole thing is a meaningless and eventually purposeless miracle of incalculable Chance or blind Necessity, — or if it is not this, then it is the very Flame which, dynamic and hidden, has shaped all these things and now, overt and revealed, can work openly on them and on itself to use, to uplift, to subtilise, to refine, to liberate, to transfigure.

If the first view is right, the view so long pressed on us by physical Science, then this very universe itself is but a queer paradoxical movement of mindless eyeless Force or of a brute substance emanating purposeless energy, which yet works as if it had a purpose; for it produces by some inconscient compulsion on itself a steady succession of evolutionary forms that carry themselves as if they had an aim and a meaning, although in the nature of things they can really have none. The whole is a mechanism which automatically turns out what it must with a certain inevitability but has no comprehending Intelligence, no intuitive Power behind it to determine its use. Universal Nature is a Chance that works as if it were a Necessity or else perhaps a Necessity that works like a self-regulating Chance. What seems to be consciousness has come out of this machine just like everything else in this singular freak-universe, constituted somehow, miraculously, impossibly, as the plant and the flower came out of the seed, somehow constituted, or as different chemical atoms are mysteriously constituted out of variant numbers of identical electrons, or as water leaps inexplicably into birth by a combination in exact measure of two gases. We have discovered that by just this process it came, — consciousness, the flower, the atom, water, — but how it could come into being by such a process is an unsolved riddle and how it took this form out of such a mother or could be the result of such ingredients and what each of these things in itself is remains unknowable. It is or has so become (or perhaps is not, but only so seems to our senses) — but that is all, for more than this science limited by its methods cannot tell and speculative philosophy itself with all its range and licence can hardly conjecture. And it does not much matter; for after all this consciousness which emerged obscurely in Time will in a later
Time disappear with its living vessels and be as if it had never been leaving behind the Inconscient still busy with its perpetual and empty labour. And perhaps indeed this consciousness is not really consciousness at all but only a sort of strange vibrant typewriting of conventional signs by which the Inconscient records to itself its own mechanical values; for things are not what they seem, colour is not colour but only a fictitious sign, all things perhaps are mere signs of bundled vibrations and consciousness itself nothing else. However we look at it, it would seem very much as if this universal Energy which creates these strange, inexplicable, impossible things or semblances that yet in a way are, were only a sort of Maya, like that of the Illusionists, aghatanaghata-patiyasi, very skilful to make happen things that cannot happen, a huge senseless well organised paradox, a sequently arranged mass of inevitable inconsequences, a defiance to reason of which reason is the last brilliant but bewildered outcome. And of all these phenomenal appearances, the uprising of consciousness is perhaps the most paradoxical, the least inevitable, — Nature's most accidental, most startling inconsequence.

And again in this reading of the universe, more baffling than any unbelievable belief — credo quia incredibile, — with which ever dogmatic theology or mystic philosophy has challenged us, man loses all his cosmic value. An infinitesimal little creature on a tiny speck of matter lost amidst a whirling multitude of stupendous universes most or all of them perhaps vacant of life and thought and made for no other end but simply to whirl, he is (justifying Scripture) even as the worm is — only an edition de luxe, with copious developments and commentaries, of the same laborious but useless text, the same minute, careful, well-arranged, painstaking but insignificant script that we see already in the ant and the termite. Individual man lasts for a few years which are in the aimless vastness of the universe of no more matter than the few days or weeks or months of the insect. The race indeed has endured for millions of years and may endure for some centuries, some thousands, myriads or millions of years longer; but what are these millions in the incalculable aeons of the cosmos? The termite perhaps was before man and may be there when he has
Consciousness and the Inconscient 293

If there is a consciousness in Matter, however secret and involved, there must be a consciousness secret and involved in the Inconscient.

But the question then arises whether such a thing can be any more than there can be a square circle [or] cold fire. “Not even a hundred declarations of the Veda,” says Shankara, “could prove the coldness of fire.” There are psychologists who deny that there is or can be any such thing as the subconscious, for it is a flat self-contradiction to speak of a consciousness which is below the level of consciousness. To be conscious is to be aware of self and things or at least of things, with whatever limitation, as a man’s or an animal’s waking mind is aware.

94

To a certain thought it might seem that only the surface of things is knowable, the rest either does not or cannot exist or
must be left in the shadow of an inevitable agnosticism. There are no depths [or they] are, as Bertrand Russell would have us believe, an uninhabited emptiness; there is no inner sky except the sky of thought or an abstract void crossed by the wandering wings of the Idea; if there is a sky behind the sky, it is such a Void, a void of unattainable superconscience. But this too is an imagination, a nonexistence. There can be no consciousness in the Inconscient, no Conscious in unconscious things, no superconscience.

If that were so, it would be impossible to have any true or whole knowledge. For our mind is an Ignorance searching for knowledge and arriving at representations or figures of it, it can never be except by a miraculous transformation something that knows, still less knows truly and knows all. But knowledge exists somewhere, knowledge is possible and a seeking ignorance is not our first and last fate. Our boundaries are lost [. . . ], the depths teem [or] are no longer vacant, the sky above mind is peopled with winged realities. The subconscious is disburdened of its strange contents, the superconscient becomes the top [of] consciousness, the peak of knowledge, there is a Conscient in unconscious things. Let us look then with the eye of the Ignorance first but also with the eye of this greater knowledge at the subconscious, at Inconscience, at the superconscient top of things. An immediate change will take place in our conception of self and our outlook on the universe.

The subconscious is a fact of our mentality. It is not the fact that our whole being, even our whole mentality, is on the surface. There are concealed heights, there are hidden gulfs, there are crowded spaces behind the front wall, below the threshold, in the unseen mental environment. There is a vast inconscient below us, an infinite superconscience above us. All these are part of a secret consciousness in the world, but also part of our own hidden being of which we are not aware or only intermittently and ignorantly or only, in our ultimate evolution, eventually aware.
Even in our ordinary experience there are moments in which one or other of these things becomes apparent, acts in our daily actions or peers out above the surface and replaces our absent and inattentive mind. We start writing and finish the writing without knowing what we have written. We are walking with our mind aware and guiding our course, — the [outer] mind, — but we continue to walk and find ourselves after a time farther on the intended way or beyond the intended goal or turn and have to retrace our steps. In an unconscious or half conscious moment words pour from our lips which we would never have spoken if we had used our fully awake mind and will. What is it that thus takes up the writing, the walk, the speech and completes our intention or betrays us? It must be either something of the mind behind or below its active surface movement or something of a driving life-force or action of the body.

But in the first explanation there must be a part of the mind, not our conscious thought and will that is capable of continuing automatically a course once habitual or previously fixed or pursuing of itself the direction accustomed or repetitive. It is capable not only of execution but of a radical direction, even a misdirection. This means a consciousness at conscious work, however vague or latently automatic, and can only be described as a subconscious or at least partly subconscious or subjacent, an underlying something else akin to consciousness. This is the first sign of a subconscious mind or of a secret consciousness which may even underlie not only our own surface being, but the whole cosmic operation and its apparently inconscient functioning and driven interactions, its purposeless purpose.

If it is a life-force that goes on with the works of the life when the mind is not attending to them, then only this must be a subconscious action and where it continues an action initiated by the conscious mind, then some sort of mechanical consciousness must be attributed to it. If it is the body that takes up the action, it must equally be credited with a subconscious that can do under certain circumstances the work of consciousness.

I have written a letter and proceed to put the name and address on the envelope, but my mind gets absorbed in something
else and I find that I have written another habitual name and address, not the one I intended. Memory evidently has done this uncalled for work, but not a conscious memory with the mind aware of what it was doing. A subconscious layer of memory must have come to the surface mistaking the call, or there must have been a double action of memory one deliberate, the other automatic, the temporary suspension of the first giving room to an inadvertent action of the subliminal working.

On the other hand I may complete a sentence with a phrase I had not intended or thought of; where did it come from if not from the subconscious mind? It may even be a phrase having no connection with the conscious thought or in itself incoherent or have the form of words but be unintelligible. What is it that has dictated these things?

As consciousness descends from the supreme and the higher to the lower levels, it loses progressively its force and intensity till it reaches the nadir of inconscience.

The figure of Inconscience is the mask of an all-conscious Creator; the Inconscient creates with an unerring art, adaptation of means to end, ingenious originality, spontaneity and [. . . ] of device. The conscious creator man cannot even come near the inconscient Creator, God. But [the] Inconscient is only a mask on a mobile face; its blank rigidity hides from us the expression of the face of the Omnipresent.

**The Inconscient Energy**

At one end of existence, the nether material end, we observe the reign of a complete phenomenal Inconscience. No creative
Consciousness or will can be detected there; we start from something that is but is not aware that it is, things that are but are unconscious that they are or that anything is. Yet it is this vast impalpable Inconscient that seems to have created Matter and the whole material universe.

There is, obvious and undeniable, an Energy that creates and there is a creation; these are the only two affirmations we can make which are beyond doubt. Even if we take the creation to be illusory, still the illusory creation is there and there is a Force or Energy or Power that has created it, whether it be mere unconscious Energy, Prakriti, or an energy of deceptive consciousness, Maya.

What we actually experience here is an energy inconscient or seemingly inconscient which is in constant motion and in that motion takes on forms or produces forms and in these forms it enters into many kinds of activity and engenders a multitude of active relations. Energy and action and the results of action, Prakriti and Karma, this is the whole formula of the material universe. Objects innumerable there are, lives too and things living, a Mind or minds, a Consciousness or consciousnesses or else perhaps mere phenomena in the Inconscient to which we give these names; but all these appear to us as if they were temporary results, events ephemeral or long persistent of the movement of Energy and action, its Karma.

What is this Energy? is it something uncreated and unborn, eternal, absolute though all it produces is created, temporal, relative? If it is born, then whence came it? in or on what does it work? what set it going and towards what? We do not know and seem to have no means of knowing; at least our intellect does not know and has not yet found out any sure way to know; it can only speculate, speculate endlessly in an inconclusive circle.

It is not an unborn eternal Matter from which it is born or of which it is the eternal force or in and on which it works, as was once supposed and as some still suppose. For that is now only a construction of the speculative mind, an idea, a hypothesis, an arbitrary postulate for which there is no discoverable correspondent reality. Matter, as we now know it, is something that we
can almost see coming into existence or at least can determine its
process of creation; waves of energy materialising into particles
and again becoming waves, but finally the waves coalesce and
become atoms of what we must needs call Matter. This cannot
be the inert inconscient Godhead, original and eternal, out of
which all came, in and on which Energy works and produces by
automatic necessity or a fortunately self-organising Chance the
material world and all the lives, minds, souls — if souls there are
— which in it live and move.

It can be said that this is only a conclusion of Science and
Science is unfinished and everchanging; it may refute tomorrow
what it affirms today; it may discover that electricity and light,
the electron and proton and the photon are not the last word or
the first fact; there may be a subtler Matter which is not that but
something else — a Matter not formed but motional, vibratory,
aetheric. But, still, what can that be but a subtler motion of
Energy, a vibration of Energy in Space? And of Space too we do
not know what it is, — whether a mere conception of our mind
and its sense or an extension of something that exceeds the grasp
of our mind and sense, — perhaps an unseizable Infinite.

The Sankhya philosopher affirmed an original indiscrimi-
nate Matter which evolves from Prakriti, from the eternal En-
ergy, — is, we might say, its first state of manifestation. But as it
is indiscriminate, it is not likely to be in any way determinable
by our senses. And, after all, this too is only a creation of Energy,
an evolution out of itself or a state which it assumes; we do not
get away from the original formula, Energy and its actions and
results, Prakriti and Karma.

An energy of some Inconscient Existence has created Matter and
the material universe. All this material universe is indeed nothing
but an inconscient Energy taking form or producing form and in
and through its forms entering into all kinds of activity. Energy
(Prakriti) and motion and action of Energy, Karma, and results
of its action — this is the formula of our universe.
But whence then comes consciousness? How can things in their very nature inconscient and unaware become conscious or develop some kind of awareness? There is here a contradiction which is inexplicable and the more we look at it, becomes more and more inexplicable.

This is possible because inconscience is a phenomenon not a fundamental reality. A phenomenon is something that appears to us, but does not show to us the whole reality of existence or of its own existence; it is a front, a face, a circumstance of something more than itself that does not appear but is — the Reality. Inconscience is a phenomenal state; it is consciousness that is the Reality; consciousness is an inherent and eternal state of being, inconscience is its temporal, temporary and apparent condition when it forms itself by its own energy into Matter and material objects. Its consciousness involves itself in inanimate Matter and seems there an inconscience; its energy too acts as if it were an inconscient energy, doing things without knowing what it is doing, creating a universe but unaware of the universe it creates, contriving millions of devices, but without any intelligence. So it seems, but so it cannot be; there is something hidden from us which we have to discover. It is the consciousness behind the Energy, the conscious Being behind the action that we have to discover.

Consciousness, being, force, energy (shakti), these are the three first terms of the fundamental truth of existence. What we have to know is how they work out together in ourselves and the universe.

*  

Chance, some say, does all; the phenomena of consciousness — for there is no such thing as consciousness in itself, only reactive phenomena of sense and mind provoked by outward impacts — are, like everything else, the products of Chance.

But what is Chance, after all? It is only a word, a notion formed by our consciousness to account for things of which we have no true knowledge — and it does not account for them.
When we do not know how or why a thing came to pass, we escape by saying, it was chance. We do not truly know how or why the universe happened or things in the universe, so we say “Chance made it; Chance did it.” An intellectual escape, nothing more. If we said “A selection, mysterious to us, out of infinite possibility,” then there would be some truth and some profundity in our thinking.

But the emergence of consciousness out of the Inconscient was more probably a necessity in the very being of being, in the innate movement of being, than merely a possibility. Necessity, then? an inevitable determination in Nature? or a self-determination in the conscious Spirit?

Consciousness and Immortality

Our existence is not a freak of some inconscient mechanical Force stumbling into consciousness nor an inexplicable activity on the surface of a blank Nothingness or an impassive inactive Infinite. There is a significance in our life, it moves towards a spiritual end, it fulfils the drive of an eternal reality.

Immortality is the nature of our being, birth and death are a movement and incident of our immortality. Birth is an assumption of a body by the spirit, death is the casting off of the body; there is nothing original in this birth, nothing final in this death. Before birth we were; after death we shall be. Nor are our birth and death a single episode without continuous meaning or sequel; it is one episode out of many, scenes of our drama of existence with its denouement far away in time.

All depends upon consciousness. For all world-existence is a form created by consciousness, upheld by consciousness, determined by consciousness. All that is is a consciousness veiled
or unveiled, manifesting or concealing its own substance. All is energy of consciousness masked by movement of mind and life and matter and taking forms which are merely motions of the energy stabilised to appearance, yet always in movement; for the consciousness that constitutes these forms is always in dynamic movement; the visible rhythm and self-result of this self-repeating or self-continuing vibration and never resting motion and dynamis is what we call form. Disperse the energy that constitutes it and the form dissolves. Withdraw the consciousness that expresses itself in the energy and the energy can keep up no longer its sustaining rhythm; therefore it disperses, therefore the form dissolves. If we could so intensify the power of the consciousness put out in us that we could keep the energy always repeating, continuing, enlarging, progressing in its rhythm, then, the form might change but need not dissolve and even physically we should be immortal[.]
The Science of Consciousness

Vedantic Psychology

102

Body, brain, nervous system are instruments of consciousness, they are not its causes.

Consciousness is its own cause, a producer of objects and images and not their product. We are blinded to this truth because when we think of consciousness, it is of the individual we think.

We look at the world in the way and speak of it in the terms of individual consciousness; but it is of the universal consciousness that the world is a creation.

The individual participates subconsciously and superconsciously in the universal consciousness. But the embodied individual in his physical or waking mind does not so much participate as arrive at participation. He is not directly part of it, but reproduces it by a partial indirect action, and in reproducing selects and varies, combines, discombines, new combines and develops his selections.

In the body his waking mind receives its impressions from the outside world and reacts upon them. Body and nerves are his instrument for the impressions and the reaction; therefore all their apparent instrumentation is nervous, physical, atomically combined, a physiological apparatus for a battery of nervous energy.

Physical, nervous and sensory impressions are the means by which this individual is induced to put himself into waking relations with the physical universe. Physical, nervous and sensory reactions are his means for entering into that relation.

*
He,—but who is he? The mental being in his mentality.

Who is it that feels himself to be separate from the world or things in the universe to be outside his being? Not the Spirit, for the Spirit contains the universe, creates and combines all relations. All personalities act in the one spirit, as our own multiple personalities act in one being. Spiritual being is their continent, they are not its constituents, but its outer results and the diverse representative selves of its consciousness and action.

Not, either, the supramental being. For the supramental being is one with the spirit in its original or basic consciousness, in its idea-consciousness it is ideally comprehensive of cosmic things or, if we must speak in terms of space, commensurate with the universe. The supramental being with one action of his Idea-self can regard universal being as his object of will and knowledge. That attitude is the seed of mind. It can regard it as contained in itself and itself contained in it, and in that way know and govern it. But it can too, like Spirit in its real action know all things by identity and govern all things by identity. Externality of being does not enter into supramental experience.

Supermind can see mind externalising objects; it can itself take a particular viewpoint fronting objects but it is in itself that it fronts them, as we front our subjective operations in mind. It does not regard them as something outside its own being, as we regard physically objects.

Mind is a delegation from supermind, which primarily regards existence as an object fronting its vision. Mental being also need not regard the universe as quite separate from or outside its own being. Subliminal mentality is capable by extension of a comprehensive relation with cosmic things and of entering into unity with the universe. Mind’s starting-point is not a containing universal vision or a knowledge by identity, but an individualised viewpoint from which it sees the universe. Still mind can arrive at a sort of containing vision, a mentalised cosmic consciousness.

What then compels embodied mind to see objects externally and by separation? It is compelled by the fact of physical embodiment. Body is a self-limitation of conscious being by
which mind is rigidly bound down to its own tendency of separative individuation.

Body, including all physical formations from the atom upwards, is a device of Nature for the extreme of conscious individuation. Empirically it is immaterial whether it is an image created by consciousness or a real substance of being. For practical purposes we may take it as a substantial formation. In fact body is a knot of conscious being built up by its own energy, instinct with nervous or subnervous life,—because the energy is in dynamic actuality a living energy—cognizing and cognized by subconscious or superficially conscious sense, because the energy is in a certain inherent reality a conscious energy. It is a knot indivisible in reality from universal Consciousness and Force and Substance but in a certain empirical utility of selective action separative rather than separate. Body, not really separate, is limited by subconscious instinct of separation and energetic tendency of separation, but not capable of effecting real separation. All its movements are a practical result of selective experience and selective action which is based on a phenomenon of separate physical being.

Body is separated from other bodies by intervention of universal matter, but both of the separate bodies are one with the indivisible intervening matter, therefore not separate in reality, but indivisibly connected in energy, and one matter in fundamental reality.

Put otherwise, two bodies are images or formations of one indivisible ethereal space, which is in reality one indivisible movement of material energy, life-energy, mind energy.

This inseparable connection and fundamental unity of bodies become of immense importance when we examine the relation of the appearances of consciousness to its reality.

Mind in body has to begin from the separation proper to body. Embodied mind is bound down in its root-action to a separative view of the universe. This is its waking view; subliminally, whether in subconscious mentality or where it approaches or touches the superconscient being, it is capable of bridging the artificial separation.
Taking this separative basis of waking consciousness for itself and for a reality, the house of imprisoned awareness from which it looks at the world, it is bound to see objects as external to this awareness and this conscious vision. Embodied mind is as if a walled house were to have a thinking soul and spirit (air and ether) and look at things not in itself as things outside through windows (the senses), receive the touches of the outside air (nervous life-impacts) as if other than the air in itself; even its own ether as other than the rest of ether (my soul and other souls). This is the self and not-self of our mentality.

Mind subliminal is able, though not normally habituated, to bridge the gulf between self and not-self; where it approaches the superconscient, this gulf lessens and conscience of oneness grows upon the being.

Body is only the instrument and basis of this extreme separative individuation, not its first cause. Mind itself is a prior cause; but mentality in itself need not be rigidly separative: especially, subliminal mind has a large integrating power. Mind in itself is only the basis of a relatively separative plurality; mind in body increases this relation into a phenomenon of absolutely separative plurality.

From this basis of externalising individuation and separative plurality waking mental consciousness in the physical universe commences its operations.

103

Psychology is the knowledge of consciousness and its operations.

A complete psychology must be a complex of the science of mind, its operations and its relations to life and body with intuitive and experimental knowledge of the nature of mind and its relations to supermind and spirit.

A complete psychology cannot be a pure natural science, but must be a compound of science and metaphysical knowledge.

This necessity arises from the difference between natural or physical sciences and psychology.

A physical science is a knowledge of physical processes
which leads inevitably to action and use of physical processes. The scientist may only regard scientific truth and not utility; but he can find only truth of the process of things, not truth of the nature of things. His discoveries bring about inevitably an utility for action; for all truth of process is an utility for action. Even when not the aim of science, process and utility are the soul and body of physical science. Matter itself is only an utility of Spirit or Being or Nature for physical process and action. Material energy is an instrumental dynamis for that utility or else an original dynamis which has no other sense of its operations. We get beyond to a higher sense only when [we] get beyond material to mental, psychical and spiritual energy, to mind, soul and spirit.

Debatable it is whether if we knew the real essence of Matter and the basic, not only the apparent, relations of mind, soul and spirit to matter and material operations, we could not arrive at an infinitely more potent use of physical process and operations. But in any case these things cannot be discovered by physical science; it has its limits and cannot exceed its limits.

Psychology may begin as a natural science, but it deals already with superphysical and must end in a metaphysical enquiry. If one side of the process it studies and its method of enquiry is physical, the other and more important is non-physical; it is a direct observation of mental operations by mind without any regard to their physiological meaning, support, substratum or instrumentation.

If this is in the first place a study of process and involves an utility for psychological action, yet what it leads to inevitably is not that action but an enquiry into the nature of mental consciousness.

This necessity arises from the immediate perception by mind of something beyond and behind its operations, some energy of hidden consciousness greater than our apparent mentality. To know what that is, we have to resort to a metaphysical enquiry.

Consciousness is itself found to be not essentially a process, — although in mind it appears as a process, but the very
nature of self-existent being. Being or the Self of things can only be known by metaphysical—not necessarily intellectual—knowledge.

This self-knowledge has two inseparable aspects, a psychological knowledge of the process of Being, a metaphysical knowledge of its principles and essentiality.

We find that one of these principles of being is energy. Energy is an eternal and inherent power of conscious being. Since all energy is convertible to action, this knowledge also contains a side of psychological and spiritual utility,—eventually perhaps even, since life and body are results of the energy of being and supports of its action, of vital and physical utility.

Two great utilities open before psychology. We may acquire the possibility of a greater being, consciousness and energy. We may open up the possibility and discover the psychical means or process [of] becoming consciously one with our original self-existent Being, with God, the Absolute, the Transcendence. To lead up to these possibilities is the aim of Vedantic psychology.

All psychology must result in and every complete statement of psychological truth must have for its frame a double schema of existence into which the facts it deals with must fall, a descending scale and an ascending scale.

The simplest elementary psychology deals with three notes of a limited scale,—the body and physical field and its impacts, the life and body and biological and physiological processes, the mental being and its conscious experience and action. This is a scale of ascension.

The nature of the physical field is the first fact; it determines everything else; it gives the impacts which awaken the consciousness, the impressions, images, subjects which are its matter, the starting-point and basis of all its conceptions, the body which is
its support, instrument, fulcrum of action, the physical occasion of the sense of self.

Everything appears to be in the body or by the body and either for the body or for the I-sense in the body.

The body seems to be the principal if not the only cause or determinant of individual consciousness.

What is not of the body is of the physical field outside the body.

Whatever in consciousness seems not to be of the physical field, yet appears to be derived from it, to be a resultant, development or deformation from physical experience.

The life in the body is the necessary modification of the first fact of material being, without whose intervention consciousness is unable to manifest in any material form. The atom is a form of matter, the stone is a material body, but life in these things is either nil or not developed to the point where manifestation of consciousness becomes possible. Consciousness in the atom and the stone is either latent, non-manifest to us, suppressed, potential or nil.

Life in any degree is not sufficient for the manifestation of mental consciousness. A certain high degree of it or else a certain indispensable kind of organisation is needed for this third tone of the scale. Plants are living, even in a degree intensely living, they have a nervous organisation, but consciousness is either nil or latent, non-manifest at least to us, suppressed or else of another kind than ours, a submental nervous consciousness and not mentality.

Life supplies certain biological conditions and certain physiological processes which physically underlie the operations of conscious mental being.

Life gives the intermediate dynamic link between mind and body.

Life has two operations which serve the purpose of mentality, a necessary life power in a nervous apparatus and a capacity
The nervous apparatus is the initial biological fact necessary to mentality. Life power consists not of the nervous system, which is a physical element, but of a new power or energy of which the system is the vehicle,—the power of nervous communication, nervous charge, nervous discharge. This power is not sufficient to create mentality, for the plant too possesses them, yet does not appear to be a mental being, but it is the first condition of embodied mentality.

A power of biological and physiological development is the secondary, continuative factor necessary to farther evolution of mentality. Once the nervous vital power appears in material body, it shows a biological power of developing a more complex physical instrumentation for a more complex nervous activity. Once it has attained a certain complexity of physical instrumentation, life seems able indefinitely to refine in some subtle way its action of nervous power so as to support a more and more fine and complex action of mentality.

How far this development of mentality can go and how far it is dependent on the physical apparatus and the nervous action is one of the capital questions of psychology.

*  

Mental being, power and operation of mental consciousness is the third note of the scale of being.

Mind cannot certainly be said to be constituted of life and body, nervous action and reaction in a physical body. Nervous action does not appear to constitute of itself consciousness, any more than physical impact and consequent atomic disturbance appears of itself to constitute nervous action. As a correspondent or resultant nervous communication, charge and discharge is necessary to manifest life, so a resultant or correspondent
conscious action,—sensation, perception, thought, conscious motivating impulsion, desire, intention, will,—are necessary to manifest mind.

Mind may or may not be an exact result, reflection or correspondence of life action in body, life thinking itself out in body, body living and thinking out its experience in mind, but it is not the same thing as life and body.

Life is a new or second power emerging from or in material energy. Mind is a new or third power emerging from or in the life-energy.

* *

But this is only the ascending scale.

Mind is not only awakened by life-action in the body at a certain evolutionary pitch of its operations; mind reacts upon and in certain ways uses, for its own characteristic purpose, modifies by its will to act and increase the life action and the ways of the body.

Mind is not limited in its thoughts by the life and body. There is an action in it which is more than a creative stress of life, an attempt to image supraphysical realities, which we may dismiss as an illusion or a result of abnormal physiological states, but may also follow as first clues to a greater truth and possibly a higher tone or tones of the scale of being.

In that case, mind appears as a larger thing than life and material being. Though apparently an evolution from life and the body, it may have been in reality a prior power, life and body only its occasions and means for self-manifestation on the material plane of being.

At any rate, psychology has to regard the scale not only from the upward point of view of body creating life, life creating mind, but from the downward point of view of mind creating new life in body.

Evidently mind is a greater thing, higher than life and body. In that case, besides the ascending scale of the lower rising to a highest possibility, we must regard a possibility of the descending
scale, the highest reality involving itself in the lower conditions of being.

But the question arises whether mind itself is the highest possibility or the highest reality.

Vedantic psychology explores the idea and intuition of a higher reality than mind.

The intuition can only be verified by psychological experience exceeding the normal action of mind. This experience may lead to constantly ascending intuitions verified by an ascent of experience to some summit of being.

Beyond mind psychological experience finds another power of energy, another note in the scale of being. This we will call the supermind. This supermind lives and acts natively in a domain of experience of which the mind becomes aware by a reflective experience and calls vaguely spirit or spiritual being.

Spirit is found to have three tones of its being. Triune, it makes each successively a power of its energy, a status of spiritual experience and form of its action. Triune, they are inseparable, but one or other can be so stressed as to appear a leading principle.

But we have to note three essential facts about spirit: —

Spirit is infinite consciousness, even when it dwells upon finite formulations of conscious being.

Awareness of spirit is infinite self-awareness.

All its three essential principles must have this character of infinity.

Infinite self-conscious bliss is the first; infinite self-conscious energy is the second; infinite self-conscious existence the third principle of spirit. Existence, consciousness, bliss are the three tones of infinity, the three basic colours of the Absolute.

The ascending scale of being presents then seven notes, matter,
life, mind, supermind, bliss self, self of conscious energy, self of primary conscious existence.

But the experience we get as we ascend in the scale leads us to the discovery that what in evolution appears subsequent is prior in reality. Life evolves in matter, but was preexistent to matter, latent, omnipresent, waiting for matter to be ready to be manifest — which it does when the movement of energy reaches a certain intensity.

Mind evolves in embodied life, but was preexistent to matter and life, latent, omnipresent, involved, a hidden cause of action waiting for life and matter to be ready for its manifestation which comes when the movement of energy has reached a greater intensity. So supermind is prior to mind, latent, omnipresent, involved even in matter and life, a hidden cause of action and waits for mind to be ready for its manifestation, and since supermind acts only in spirit spirit too must be there latent, omnipresent, involved, a hidden cause of action. But spirit is not dependent on the evolution of supermind for its manifestation; it can appear to our mentality, to our life-consciousness, even to our physical mind.

The true nature and rationale of this priority appear in the descending scale. There we see the true development of the universe.

Spirit of self-being develops self of conscious energy which supports its self of cosmic bliss, which acts on the finite by supermind, which offers its differentiations to mind, relates them in life, fixes them phenomenally in body of material substance. This is the descending scale by which universe is created or made sensible to embodied soul.

But in the material world, all is first involved in matter and has to find itself by a development from material being and with material being as its support and basis. The evolving process of this self-discovery of the universal existence produces the phenomenon of evolution of higher and greater from lower and lesser principles which we call the ascending scale of being.

This phenomenon baffling now to the reason becomes a self-evident proposition when we observe the descending scale and
find involution to have preceded evolution. The phenomenon arises inevitably from the nature of our being.

*  

Schema of being has to be formulated from these two points of view, the results, though data of experience, being at first taken as a working hypothesis, subject to verification. We follow actually the ascending scale, but the descending scale has first to be shown, as otherwise the possible explanations of psychological phenomenon which result from this line of experience, would be unintelligible and would have either to be excluded or the whole enquiry restated in altered detail in the end.

All questions of the reality or unreality of the world, its fundamental or ultimate purpose or want of purpose, the destiny of the soul, must be left over till the psychological data have been understood. To proceed otherwise would be to determine them by metaphysical reasoning; but the object before us is to arrive at them by the road of psychology.

The whole psychology of Vedanta depends upon this double scale and without it could have no complete scientific verification. Because it exists experience of consciousness can give a clue to the nature of world existence. Metaphysical reasoning by itself could only give us philosophical opinions, psychological verification makes Vedantic truth a firm guide in life. It gives us a tangible ladder of ascension by which we rise to our highest truth of being[.]

The knowledge at which psychology arrives in its largest generalisations, is that there is one absolute and indefinable Reality which we call for psychological purposes the Self one, indivisible and common to all existence which manifests itself with an infinite variety in the universe and that every soul is an individual personality — we will use the word for want of a better — of that Self manifesting itself with a variety not precisely infinite,
but indefinite, but in accordance with its individual nature which provides the principle of harmony, regulates the variety, casts it into a certain mould of unity. All existence is one, but with a constantly active principle of variation and individuation. There is a universal nature of things, but man while abiding within the principles of that nature, has also a nature of his own which distinguishes him from the animal and from lower forms of life. There is therefore this general individuality of Man which the totality of mankind represents in its full play of oneness and variety. Within that general individuality there are typal, racial, national, class individualities and each man has his own individual nature, one indeed in its general basis and materials with general human nature and with his type, race, class, nation, but yet possessed of its own principle of particular individuation. It is this which reigns in his mentality, vital being, physical being and stamps itself upon them, but in itself it is neither mental, vital nor physical, but proceeds from a secret principle superior to all these; mind, life and body are only means and values of his self-expression. So is it with every community, nation or other natural grouping of men.

Towards a True Scientific Psychology

106

When the ancient thinkers of India set themselves to study the soul of man in themselves and others, they, unlike any other nation or school of early thought, proceeded at once to a process which resembles exactly enough the process adopted by modern science in its study of physical phenomena. For their object was to study, arrange and utilise the forms, forces and working movements of consciousness, just as the modern physical Sciences study, arrange and utilise the forms, forces and working movements of objective Matter. The material with which they had to deal was more subtle, flexible and versatile than the most
impalpable forces of which the physical Sciences have become aware; its motions were more elusive, its processes harder to fix; but once grasped and ascertained, the movements of consciousness were found by Vedic psychologists to be in their process and activity as regular, manageable and utilisable as the movements of physical forces. The powers of the soul can be as perfectly handled and as safely, methodically and puissantly directed to practical life-purposes of joy, power and light as the modern power of electricity can be used for human comfort, industrial and locomotive power and physical illumination; but the results to which they give room and effect are more wonderful and momentous than the results of motorpower and electric luminosity. For there is no difference of essential law in the physical and the psychical, but only a difference and undoubtedly a great difference of energy, instrumentation and exact process. The Supreme Existence which expresses itself equally in soul and matter, moves upon one fundamental principle on all its sevenfold levels, and even by one set of medial processes, but It varies their minute arrangement and organic functioning to suit the material which it is using and the objective which it has set before Itself in Its divine movement.

Exact observation and untrammelled, yet scrupulous experiment are the method of every true Science. Not mere observation by itself — for without experiment, without analysis and new-combination observation leads to a limited and erroneous knowledge; often it generates an empirical classification which does not in the least deserve the name of science. The old European system of psychology was just such a pseudo-scientific system. Its observations were superficial, its terms and classification arbitrary, its aim and spirit abstract, empty and scholastic. In modern times a different system and method are being founded; but the vices of the old system persist. The observations made have been incoherent, partial or morbid and abnormal; the generalisations are far too wide for their meagre substratum of observed data; the abstract & scholasticuse of psychological terms and the old metaphysical ideas of psychological processes still bandage the eyes of the infant knowledge, mar its truth and
hamper its progress. These old errors are strangely entwined with a new fallacy which threatens to vitiate the whole enquiry, — the fallacy of the materialistic prepossession.

107

Psychology ought to be rather than is the science of consciousness and of the motions of consciousness as distinguished from the science of form and of the motions of form. We are dealing, therefore, in psychology with a more subtle, flexible and versatile material than in the physical sciences; its motions are more elusive, its processes harder to fix; but when once grasped and ascertained, its laws and activities are found to be quite as regular, manageable and utilisable as the processes of physical Nature. They give room to even more wonderful and momentous results. There is no difference of essential law in the physical & psychical, but a great difference of instrumentation and exact process. For the Supreme Existence moves on one fundamental principle or one set of principles in all its manifestations, but varies its organic arrangement and functioning of the principles to suit the material which It is using & the objective which It intends to reach. In both fields observation & experiment are the only sound foundation of knowledge. But observation without experiment leads only to a limited and erroneous science, often to an empirical system of surface rules which do not deserve the name of science at all. It is this defect which has so long kept European psychology in the status of a pseudo-science; and, even now when real observation has begun & experimentation of an elementary kind is being attempted, the vices of the perishing sciologism mar and hamper this infant knowledge. It has not rid itself of all its old scholastic swaddling clothes; therefore it still walks on all fours and cannot yet learn to stand up erect and walk.

108

Psychology is the science of consciousness and its status and operations in Nature and, if that can be glimpsed or experienced,
its status and operations beyond what we know as Nature.

It is not enough to observe and know the movements of our surface nature and the superficial nature of other living creatures just as it [is] not enough for Science to observe and know as electricity only the movements of lightning in the clouds or for the astronomer to observe and know only those movements and properties of the stars that are visible to the unaided eye. Here as there a whole world of occult phenomena have to be laid bare and brought under control before the psychologist can hope to be master of his province.

Our observable consciousness, that which we call ourselves, is only the little visible part of our being. It is a small field below which are depths and farther depths and widths and ever wider widths which support and supply it but to which it has no visible access. All that is our self, our being, — what we see at the top is only our ego and its visible nature.

Even the movements of this little surface nature cannot be understood nor its true law discovered until we know all that is below or behind and supplies it — and know too all that is around it and above.

For below this conscient nature is the vast Inconscient out of which we come. The Inconscient is greater, deeper, more original, more potent to shape and govern what we are and do than our little derivative conscient nature. Inconscient to us, to our surface view, but not inconscient in itself or to itself it is a sovereign guide, worker, determinant, creator. Not to know it is not to know our nether origins and the origin of the most part of what we are and do.

And the Inconscient is not all. For behind our little frontal ego and nature is a whole subliminal kingdom of inner consciousness with many planes and provinces. There are in that kingdom many powers, movements, personalities which are part of ourselves and help to form our little surface personality and its powers and movements. This inner self, these inner persons we do not know, but they know us and observe and dictate our speech, our thoughts, feelings, doings even more directly than the Inconscient below us.
Around us too is a circumconscient Universal of which we are a portion. This Circumconscience is pouring its forces, suggestions, stimulus, compulsions into us at every moment of our existence.

Around us is a universal Mind of which our mind is a formation and our thoughts, feelings, will, impulses are continually little more than a personally modified reception and transcription of its thought-waves, its force-currents, its foam of emotion and sensation, its billows of impulse.

Around us is a permanent universal life of which our petty flow of life-formation that begins and ceases is only a small dynamic wave.

Psychology is the science of Consciousness; it is the knowledge of its nature, its processes and the aim or results of its processes, its law or laws of being, its habitat and instruments, its what, why, where, whence and whither.

But what is consciousness and can there be a science of consciousness? We are not in presence of a body of concrete, visible or sensible facts, verifiable by all, which form an indisputable starting-point, are subject to experiment and proof, where theories can be tested at every point and discarded if they do not accord with the facts, with all the facts. The data here are subjective, fluid, elusive. They do not subject themselves to exact instruments, can lend themselves to varying theories, do not afford proofs easily verifiable by all. Their presentation is difficult and can hardly be more than scanty and often infantile in their insufficiency. Theories are numerous, but few or none have any solidity or permanence.

To understand the psychology of others we depend upon our observation of them and our own interpretation of the movements we observe and our comparison with our own psychological actions and reactions. But our observation is limited by the fact that what we observe is not the psychological events we wish to study but signs of speech, action, facial or bodily
expression which seem to us to indicate them; but it is still more limited by the possibility of error in our observation and still more in our interpretation. Errors of wrong attribution, exaggeration, diminution, false evidence, false valuation, crop up at every turn; indeed, the whole observation may be nothing but error, the interpretation purely personal and mistaken. Comparison with ourselves may be a fruitful fountain of mistakes; there is no doubt a general similarity in the mass of human reactions, but the differences and variations are also marked and striking; there is here no source of certitude.

A direct experiential and experimental psychology seems to be demanded if psychology is to be a science and not merely a mass of elementary and superficial generalisations with all the rest guesswork or uncertain conclusion or inference. We must see, feel, know directly what we observe; our interpretations must be capable of being sure and indubitable; we must be able to work surely on a ground of sure knowledge.

Modern psychologists have aimed at certitude in their knowledge, have found it or thought they found it by mixing up psychology and physiology; our physiological processes are supposed to be not only the instrumentation or an instrumentation of our consciousness, but the base or constituents of our psychological processes. But by this method we can only arrive at an extended physiological, not at a true psychological knowledge. We learn that there is a physical instrumentation by which physical things and their contacts work upon our consciousness, reach it through the nerves and the brain and awake certain reactions in it which may however vary with the brain and the consciousness contacted; we learn that the consciousness uses certain physiological processes as well as physical means to act upon outward things and conditions; we learn too that physical conditions have an action upon our state of consciousness and its functionings. But all this was to be expected, since we are a consciousness embodied and not disincarnate, acting through a
body and with a body as a habitation and instrument and not a pure consciousness acting in its own right[.]

Yogic Psychology

110

The problem of consciousness can only be solved if we go back to a radical state of our existence in which things get back to their reality. For there they are no longer a mass of phenomena which have to be cleared up, classified, organised by the perceptions, conceptions and relative logic of the human intellect. These perceptions, these concepts, this logic belong to an imperfect instrument and the arrangements they make can only be provisional and, at that, onesided and only half-true or a good deal less than half-true — and even that truth is of an inferior kind, a constructed representation and not truth itself in its own nature. In fact the intellect sees only the phenomenon, it cannot go back behind it; when it tries, it only arrives at other and more occult phenomena. The truth of things can only be perceived when one gets to what may be called summarily the spiritual vision of things and even there completely only when there is not only vision but direct experience in the very substance of one’s own being and all being.

111

Consciousness is not an unaccountable freak or a chance growth or a temporary accident in a material and inconscient universe.

It may so appear on the surface and physical science, since by its very terms it is limited to the examination of appearances and must start from the surface phenomenon, may choose or may have no alternative but to treat it on that basis. But surface appearances are not the reality of things, they may be a part of the truth but they are not the whole reality. One must look
beyond the external appearances of things before one can know things in themselves: especially first appearances are apt to be deceptive. It is not by regarding a flash of lightning as a chance ebullition of fiery temper in a cloud that one can know the truth of electricity. We must go far and dig deep before we can get at the truth about the Force that manifested the lightning. Consciousness may similarly appear as a phenomenon, an outbreak of sentience in the obscurity of an originally nescient being; but we must go far beyond that specious appearance if we would know the true nature and origin and discover the entire possibilities of this apparently strange and anomalous force. For anomalous it is, since it occurs in a fundamentally inconscient universe of Matter and strange and curious it is in its reactions, aberrations, workings, destiny.

Physical science — and psychology in its present methods is only an extension of physical science — conducts its search into things from down upwards; it regards Matter as the foundation and the bottom of things and having searched into that foundation, got as it thinks to the very bottom, it believes, or once believed, it has by that very fact understood their depths, their centre, their height and top. But this is a naive error. The truth of things is in their depths or at their centre and even at their top. The truth of consciousness also is to be found at its top and in its depths or at its centre; but when we enter into the depths of consciousness or when we try to reach its centre, we go off into trance and likewise before we get to its top, we go off into trance.

Our searches into Matter also are vitiated by the fact that in Matter consciousness is in a trance and gives no apparent response to our probings. In living Matter, not yet mental, still subconscious, it does give sometimes a reply, but not one that we can understand, and, as for mind in the animal, it is only consciousness half awakened out of the original trance of inconscient Matter: even in the human being it starts from an original nescience, its expressions, its data, all that we can ordinarily observe of it, are the movements of Ignorance fumbling for knowledge. We cannot understand from these alone what
consciousness really is nor discover its source or its supreme possibilities or its limits, if indeed it has any limits and is not like being itself infinite and illimitable. Only if we can get away from this imperfection and ignorance to some top of its possibilities or to its latent depths or some hidden centre, can we discover its true nature and through it the very self and reality of our being.

How do we know that there is a top to consciousness or an inner centre, since these are not apparent on the face of things? By its supernormal, not its normal manifestations and phenomena, for the top of things is always supernormal, it is only the bottom and what is near to the bottom that are normal, at any rate to our ordinary consciousness in the material universe. Especially we can know by the supernormal becoming normal to us—by Yoga.

I mean by Yogic psychology an examination of the nature and movements of consciousness as they are revealed to us by the processes and results of Yoga.

This definition at once takes us out of the field of ordinary psychology and extends the range of our observation to an immense mass of facts and experiments which exceed the common surface and limited range very much as the vastly extended range of observation of Science exceeds that of the common man looking at natural external phenomena only with the help of his unaided mind and senses. The field of Yoga is practically unlimited and its processes and instrumentation have a plasticity and adaptability and power of expansion to which it is difficult to see or set any limit.

It is true that modern psychology has probed the internal law of living matter and consciousness and arrived at results which are remarkable but limited and fundamentally inconclusive. We know from it that the movements of consciousness are affected and on a certain side determined by the functioning of the physical organs. But still the nature, origin and laws of consciousness remain unknown; all that has been proved is that the body
provides for it an engine or instrumentation for its manifestation in living physical bodies and that certain lesions, alterations or deteriorations of the engine may lead to considerable or serious results in the functioning of the embodied consciousness. This was to be expected and can at once be conceded; but there is no proof that consciousness is a function of matter or that it was originated by the chemical or biological processes of the body or that it perishes with the dissolution of life in the body. The cessation of its functioning in the body at death proves nothing, for that was to be expected whatever the origin of consciousness or its fundamental nature. Its disappearance may be a departure, a disappearance from the body, but not a disappearance from existence.

It is true also that modern inquiry probing into psychological (as opposed to physiological) phenomena has discovered certain truths that are equally discovered by Yogic process, the role of the subconscient, the subliminal, double or multiple personality; but its observations in these fields are of an extremely groping and initial character and one does not see easily how it can arrive at the same largeness of results here as in physiology, physics, chemistry or other departments of physical Science.

It is only by Yoga process that one can arrive at an instrumentation which will drive large wide roads into the psychological Unknown and not only obscure and narrow tunnels. The field of psychology needs a direct inner psychological instrumentation by which we can arrive at sure data and sure results in ourselves verified [by] equally sure data [and] results in our observation of others and of the hidden psychological world and its play of unseen forces. The physical is the outwardly seen and sensed and needs physical instruments for its exploration; the psychological is the physically unseen and unsensed, to be discovered only by an organisation of the inward senses and other now undeveloped and occult means. It is through consciousness, by an instrumentation of consciousness only that the nature and laws and movements of consciousness can be discovered — and this is the method of Yoga.
Section Three

Yoga

Change of Consciousness and
Transformation of Nature
Yoga is a means by which one arrives at union with the Truth behind things through an inner discipline which leads us from the consciousness of the outward and apparent to the consciousness of the inner and real. Yoga consciousness does not exclude the knowledge of the outer apparent world but it sees it with the eyes of an inner, not an outer seeing and experience, alters and sets right all its values in the light of an inner deeper greater truer consciousness and applies to it the Law of the reality, exchanging the law of the creature’s Ignorance for the rule of a divine Will and Knowledge.

A change of consciousness is the whole meaning of the process of Yoga. 

Yoga is the science, the process, the effort and action by which man attempts to pass out of the limits of his ordinary mental consciousness into a greater spiritual consciousness.

All yoga is in its essential heightening or deepening of our consciousness so that it may become capable of something beyond our ordinary consciousness and our normal Nature. It is an entering into depths, an ascent towards heights, a widening beyond. Or it is contact with depths within, heights
above, vastnesses beyond us, an opening to their greater influences, beings, movements or a reception of them into our surface consciousness and being so that the outer [is] altered, enveloped, governed by what is not our ordinary self. For the Reality which we are seeking does not lie on our surface or, if it is there, it is concealed and only a deeper, higher or wider consciousness than any to which we now have access can reach, touch or know and possess it. Even if we dive below our normal consciousness to find what is there it is some aspect of the Reality into which we enter.

By Yoga is meant — the word is not here used in the limited sense given to it in the disputations of Pandits — the use and [?] of certain processes of self-discipline [and] self-exercise or spontaneous and automatic self-intensification and self-extension of the mind and whatever in us is limited and that by which we enter into a larger deeper consciousness than is ordinarily ours.

This consciousness is aware of external things not only through the physical mind and senses but by other though often similar means of Mind, an inner sense or senses, an inner tact or feeling such as a projective or responsive awareness of things at a slight or great distance, a premonitory sense of things about to happen [or] preparing to happen, a feeling of things or persons not seen, an inner vision of physical objects and happenings not before the eye and hundreds of other phenomena not normal to the ordinary mind. These phenomena are ordinarily labelled occult or psychic or described as hallucinatory according to the point of view of the speaker, but such epithets explain nothing. This range of phenomena exists and for anyone who would know the nature and origin and possibilities of consciousness an examination of them is imperative.

This range of phenomena is however only an outer fringe of Yoga. It is more important that it admits to an inner field of
experiences of the utmost import, to a growth of psyche and spirit, to deepest realities and [*finally] to the deepest of all; [... ...]

But what precisely do we mean by the word Yoga? It is used here in the most general sense possible as a convenient name including all processes or results of processes that lead to the unveiling of a greater and inner knowledge, consciousness, experience. Any psychic discipline by which we can pass partly or wholly into a spiritual state of the consciousness, any spontaneous or systematised approach to the inner Reality or the supreme Reality, any state of union or closeness to the Divine, any entry into a consciousness larger, deeper or higher than the normal consciousness common to humankind, fall automatically within the range of the word Yoga. Yoga takes us from the surface into the depths of our consciousness or it admits us into its very centre; it takes us up to the hidden topmost heights of our conscious being. It shows to us the secrets of the Self and the secret of the Divine. It gives us the knowledge, the vision, the presence of the Immanent and the Cosmic and the Transcendent Reality; that is its supreme purpose. On a lower grade it gives us the key to an inner and larger consciousness that is subliminal to us and brings out its experiences, its powers and possibilities and unless we know these things the secret of Consciousness and the knowledge of our whole being must escape us. It is through this door that we pass from a nescience of our true nature into a full light of self-knowledge.

But there are methods, schools, disciplines of Yoga that are turned towards one restricted aim, follow each a different path, win control of a separate province and by following that exclusive path we shall know that province of our being only or reach a single summit. It is by the integrality of Yoga that one can attain the integrality of consciousness. Our aim must be to embrace in this new knowledge all the planes of consciousness and all its summits. Then in the light of the knowledge brought to us and its widening and heightening of our consciousness, it is in the light of the top of things
that we have to see and know all. It is then only that our ignorance or a very partial and surface awareness of ourselves can be flooded by a light of self-revelation and turn into self-knowledge.

Yoga is in its essence a passage from the ordinary consciousness in which we are aware only of appearances into a higher wider deeper consciousness in which we become aware of realities and of the one Reality. Not only do we become aware of it, but we can live in it and act from it and according to it instead of living in and according to the appearance of things. Yoga is a passage from ignorance to self-knowledge, from our apparent to our true being, from an outer phenomenal mental vital material life-existence to an inner spiritual existence and a spiritualised nature.

By Yoga we pass from the phenomenal to the real Man, from the consciousness of our own apparent outer nature to the consciousness of our real self, Atman, an inner and inmost man, Purusha, that which we truly and eternally are. This self or true being remains constant through all the changes of our phenomenal being, changes of the mind, life or body or changes of our apparent personality; it is permanent, perpetual and immortal, a portion or manifestation of the Eternal.

By Yoga we pass also from our consciousness of the phenomenal appearance or appearances of the cosmos or world around us to a consciousness of its truth and reality. We become aware of the world as a manifestation of or in universal being who is the true truth of all that we see, hear, experience. We become aware of a cosmic Consciousness which is the secret of the cosmic Energy, a cosmic Self or Spirit, the cosmic Divine, the universal Godhead.

But by Yoga we become aware also that our own Self or true being is one with the cosmic Self and Spirit, our nature a play of the cosmic Nature; the wall between ourselves and the
universe begins to disappear and vanishes altogether. We realise the selfsame Pantheos in ourselves, in others and in all universal existence.

But also by Yoga we become aware of something that is more than our individual being and more than the cosmic being, a transcendent Being or Existence which is not dependent on ours or the existence of the universe. Our existence is a manifestation of and in that Being, the cosmos also is a manifestation of and in that one Supreme Existence.

This then is the Truth or Reality to which we arrive by Yoga, a one and supreme Being or Existence and Power of Being which manifests as a cosmic Self or Spirit and a cosmic Energy or Nature and in that again as our own self or spirit which becomes aware of itself as an individual being and nature.

Union: The Aim of Yoga

118

It is the aim of all Yoga to pass by a change of consciousness into the Reality that is behind things and live no longer in their appearance. To enter into some kind of union or communion or participation in that is the common object of all Yoga.

But the Reality presents itself to the consciousness of man the mental being under many aspects. We seek after union or closeness to the Divine, whatever the Divine may be. We see the Divine as a personal Godhead or as an impersonal Existence. A God of Love or compassion attracts us or a God of might and power. It is a divine Friend who meets us or a Divine Master or a World Father or World Mother or an almighty Lord of all or a Divine Lover. We are in the presence of a Cosmic Spirit in whose universal consciousness we lose our separate ego or a Supracosmic Absolute in whom we lose altogether our cosmic as well as our individual existence. We find our own highest Self or the Self of all or we pass into a sublime
Mystery without relation or feature where neither self nor all can exist any longer. Or it may be the inexpressible mystery of an original Nihil that abolishes for us all suffering along with all existence — or else that Nihil may be a mystic All that is far other than the false and illusory being created for us by mind and life experience.

119

Yoga is our union with some Being or some Reality, which is greater than ourselves or is our own greatest and real Self; it is That which by Yoga we join, enter into or become.

120

All Yoga strives towards union with the Highest, the Spirit, the Self, the Divine, or whatever other name or aspect we seize of the One Eternal and Infinite.

And by union we mean, first, contact constant and increasing with the consciousness of the Divine or Infinite, then to assimilate it or assimilate ourselves to it, then to become not only like to it and full of it, but to enter into it and dwell in it, to become that divine consciousness and being, essence of its essence and so abolish all division that separates us from the Divinity from whom we came.

121

To be one with the Eternal is the object of Yoga; there is no other object, because all other aims are included in this one divine perfection.

To be one with the Eternal is to be one with him in being, consciousness, power and delight. All that is is summed in these four terms of the infinite, for all else are but their workings.

To be one with the Eternal is also to live in the Eternal and in his presence and from his infinite nature, — sayujya, salokya,
samipya, sadrishya. These four together are one way of being and one perfection.

To live in the Eternal is also to live with the Eternal within us. Whosoever consciously inhabits his being, his conscious presence inhabits. God lives and moves and acts in us when we live and move and act in him[.]

122

Yoga is the contact of the humanity in us with the deity in which it dwells, of the finite with the Infinite, of the as yet accomplished evolving & imperfect humanity with its yet unevolved attainable perfection, of the outwardly active waking consciousness which is controlled with the inwardly active controlling consciousness, of man with God, of the changing outward apparent ego with the secret real and immutable Self. By that contact the lower rises to the higher, the unevolved evolves, the unborn is created, humanity assumes some part of godhead, man moves upward to God. This upward and self-expanding movement is the utility of Yoga.

123

To be one in all ways of thy being with that which is the Highest, this is Yoga. To be one in all ways of thy being with that which is the All, this is Yoga. To be one in thy spirit and with thy understanding and thy heart and in all thy members with the God in humanity, this is Yoga. To be one with all Nature and all beings, this is Yoga. All this is to be one with God in his transcendence and his cosmos and all that he has created in his being. Because from him all is and all is in him and he is all and in all and because he is thy highest Self and thou art one with him in thy spirit and a portion of him in thy soul and at play with him in thy nature, and because this world is a scene in his being in which he is thy secret Master and lover and friend and the lord and sustainer and aim of all thou art, therefore is oneness with him the perfect way of thy being[.]
The human being on earth is God playing at humanity in a world of matter under the conditions of a hampered density with the ulterior intention of imposing law of spirit on matter & nature of deity upon human nature. Evolution is nothing but the progressive unfolding of Spirit out of the density of material consciousness and the gradual self-revelation of God out of this apparent animal being.

Yoga is the application, for this process of divine self-revelation, of the supreme force of tapas by which God created the world, supports it & will destroy it. It substitutes always some direct action of an infinite divine force for the limited workings of our fettered animal humanity. It uses divine means in order to rise to divinity.

All Yoga is tapasya and all siddhi of Yoga is accomplishment of godhead either by identity or by relation with the Divine Being in its principles or its personality or in both or simultaneously by identity and relation.

In the end a union, a closeness, a constant companionship in the soul with the Divine, and a yet more wonderful oneness and inliving[.]
nature of humanity with the eternal, supreme or divine Nature.

The greater the union, the greater the Yoga, the more complete the union, the more complete the Yoga.

There are different conceptions of the supreme Being and to each conception corresponds a school of Yoga with its separate idea and discipline. But these are partial and not complete systems; or rather they are complete in themselves, but do not cover the whole human being and nature. Most of them lead away from life and are useful only to the few who are moved to turn away from human existence and seek the bliss of some other state of being. To humanity at large this kind of Yoga has no real message. The complete Yoga will be one which accepts God in the world and oneness with all beings and solidarity with the human kind, fills life and existence with the God-consciousness and not only raises man the individual but leads man the race towards a total perfection.

The aim put before itself by Yoga is God; its method is tapasya.

God is the All and that which exceeds & transcends the All; there is nothing in existence which is not God but God is not anything in that existence, except symbolically, in image to His own consciousness. Humanity also is a symbol or eidolon of God, we are made in His image; and by that is meant, not a formal image, but in the image of His being and personality, the essence of divinity & its quality, the divine being & divine knowledge.

There are in every thing existing phenomenally or, as we shall say, symbolically, two parts, the thing in itself & the symbol, Self & Nature, res (thing that is) & factum (thing that is made), immutable being & mutable becoming, that which is supernatural in it & that [which] is natural.

Everything in existence has something in it which seeks to transcend itself; Matter moves towards becoming Life, Life moves towards becoming Mind, Mind moves towards becoming ideal Truth, ideal Truth rises to become divine & infinite Spirit.
The reason is that every symbol, being a partial expression of God, reaches out to & seeks to become its own entire reality; it aspires to become its real self by transcending its apparent self. Thing that is made is attracted towards Thing that is, becoming towards being, the natural to the supernatural, symbol towards Thing in itself, Nature towards God.

The upward movement is the means towards fulfilment of existence in the world; downward movement is destruction, Hell, perdition. Everything tends [to] move upward; once it is assured of its natural existence, it seeks the supernatural. Every nature is a step towards some supernature, something natural to itself but supernatural to what is below it. Life is supernatural to Matter, Mind supernatural to Life, ideal being supernatural to mental being, infinite being supernatural to ideal being. So too man is supernatural to the animal, God is supernatural to man. Man too as soon as he has assured his natural existence, must insist on his upward movement towards God. The upward movement is towards Heaven, the downward movement towards Hell.

The animal soul fulfils itself when it transcends animality & becomes human. Humanity also fulfils itself when it transcends humanity & becomes God.

By yielding to Nature, we fall away both from Nature & from God; by transcending Nature we at once fulfil all the possibilities of Nature & rise towards God. The human touches first the divine & then becomes divine.

There are those who seek to kill Nature in order to become the Self; but that is not God’s intention in humanity. We have to transcend Nature, not to kill it.

Every movement of humanity which seeks to destroy Nature, however religious, lofty or austere, of whatever dazzling purity of ethereality, is doomed to failure, sick disappointment, disillusionment or perversion. It is in its nature transient, because it contradicts God’s condition for us. He has set Nature there as a condition of His self-fulfilment in the world.

Every movement of humanity which bids us be satisfied
with Nature, dwell upon the earth & cease to look upwards, however rational, clear-sighted, practical, effective, comfortable it may be is doomed to weariness, petrifaction & cessation. It is in its nature transient because it contradicts God’s intention in us. He dwells secret in Nature & compels us towards Him by His irresistible attraction.

Materialistic movements are as unnatural & abnormal as ascetic & negatory religions & philosophies. Under the pretence of bringing us back to Nature, they take us away from her entirely; for they forget that Nature is only phenomenally Nature but in reality she is God. The divine element in her is that which she most really is; the rest is only condition, process & stage in her development of the secret divinity.

Not to be ensnared, emmeshed and bound by Nature, not to hate & destroy her, is the first thing we must learn if we would be complete Yogins & proceed towards our divine perfection.

Being still natural in the world to transcend Nature internally so that both internally & externally we may master & use her as free & lord, swarat samrat, is our fulfilment.

Being still the symbol to reach through it the thing that symbolises itself, to realise the symbol, is our fulfilment.

Being still a figure of humanity, man among men, a living body among living bodies, though housed in life & matter yet a mental being among mental beings, being & remaining all this that we are apparently, yet to exceed all this apparent manhood and become in the body what we are really, God, spirit, supreme & infinite, pure Bliss, pure Force, pure Light, this is our fulfilment.

Our whole apparent life is a becoming, but all becoming has for its goal & fulfilment being & God is the only being; to become divine in the nature of the world, in the symbol of humanity is our fulfilment.

Yoga in its practice may be either perfect or partial, either selective or comprehensive. Perfect and comprehensive Yoga avoids limitations by aspects and leads to entire divinity.

If we are to exceed our human stature and become divine,
we must first, in our Indian phrase, get God; for this human ego is the lower imperfect term of our being, God is its higher perfect term. God in us is the possessor of our super-nature and without Him there is no effectual rising. The finite cannot become infinite, unless it perceives & desires to touch its own secret infinity; nor can the symbol-being, unless it knows, loves and pursues its Self-Reality, overcome the present limits of its merely apparent nature. This necessity is the imperative justification of religion, — not of a church, creed or theology; for these things are all outward religiosity rather than the truth of religion, but of that personal and intimate religion, a thing of temper and spirit and life, not of views or ceremonies which draws each man to his own vision of the Supreme or his own idea of something higher than himself. Without the worship of the Supreme in the heart, the aspiration towards it in the will or the thirst for it in the temperamental cravings we shall not have the impulse or the strength for the difficult and supreme effort demanded of us. Therefore have the prophets spoken and the Avatars descended, so that mankind may be inspired to this great call upon its upward-straining energies. The aim of rationalism & Science is to make man content with his humanity and contradict Nature, baffling her evolution; the aim of religion, — but not unhappily of the creeds & Churches — is to farther the great aim of Nature by pushing man towards his evolution.

The attainment of God is the true object of all human effort for which all his other efforts political, social, literary, intellectual, are only a necessary condition & preparation of the race; but then there are both differences in the state of the attainment, differences in its range & effectivity. Three states of divine attainment may usefully be distinguished, touch with God, indwelling in Him & becoming He. The first is initial & elementary; unless passing the veil of our ordinary nature we touch the divine Being or He leaning down impose His touch [on] us, unless we come first into contact with Him either in our heart, our mind, our works or our being, we cannot go on to indwell in Him. If we are strong in spirit, the touch may indeed be rapid & summary & we may wake at once & stride
forward to the state of divine indwelling, soul of man in the
soul of God, the individual in the universal; but the touch must
be there. To enforce this preliminary step, to bring man into
some kind of contact with God, is the common and sometimes
the sole preoccupation of human religions. It does not matter
greatly to Nature for her purpose how it is done,—in however
crude & elementary a way, through whatever intellectual errors
& emotional blunders or ethical outrages, the touch must be
established; this imperatively & above all things the religious
spirit demands. Nature, as is always her way, presses on to her
all-important, immediate steps and is willing to purchase a single
great & general gain by any number of particular losses. Man,
besides, is so various in the arrangement of his human qualities,
the master spring as well as the peculiar temperament differs so
greatly or so subtly in each individual that there can never be, for
this purpose of Nature’s, too many sects, disciplines or different
religions. Swami Vivekananda has well seen the consummation
of religion in a state when each human individual has his own
religion dictated by his own spiritual needs & nature; for collec-
tive creeds, Churches & theologies, in spite of their temporary
necessity & some undeniable permanent advantages, help to
formalise the upward effort & deprive it of its adaptability,
freedom & perfect individual sincerity. The priest & dogma will
seldom leave God & the soul free to meet each other in that
solitude & spontaneity which gives the union its highest force
& delight. They are always pressing in to control & preside
at the marriage & legitimise it with formulas, rites & official
registration.

Moreover the intellect of natural man is narrow, his effort
soon exhausted & easily satisfied with imperfection. If he is led
to think that his way of contact with the Divine is the only way,
his own freedom of higher development is fettered or entirely
taken away from him & in his intellectual & religious egoism
he militates against the freedom of others. Most religions tend
easily to believe that the contact with God once established,
no matter with what limitations or of what kind, all is done
that needs to be done, all fulfilled that God demands of us.
Popular religions tend naturally to be dualistic and to preserve a trenchant distinction between man & God dividing the symbol being from That which expresses itself in him; while with one hand they raise man towards his super-nature, with the other they hold him down to his ordinary nature. The lower is suffused with the glow of the higher & touched with its power & rapture, but it does not itself rise into & dwell within it. At its lowest the dualistic soul cherishes the taint of its imperfections, at its highest, unless in rare self-transcending moments, keeps itself distinct in awe & reverence from the divine Lover, worships at His feet but cannot hide itself in His bosom.

Therefore Nature, still following her upward surge, has provided a mightier rank of human souls who are capable of going forward beyond this preliminary effort & having entered into the very being of God, of dwelling there in beatitude. Entering into the consciousness of the Infinite, feeling it all around them & in them, ever thrilling with its touch, aware of identity with It in nature, joy and inner awareness, they yet preserve a constant separateness of their special being in that identity. They do not plunge themselves wholly into the divine ocean or, if they go down into it, they keep hold on a fathomline which will preserve their touch with the surface. In their nature—all be their opinions—such men are Visishtadwaitins, souls not drawn towards entire oneness. But unless man plunges himself wholly into God caring not whether he reemerge, unless the human sacrifices himself wholly to the divinity, keeping back no particle of his being, not even the least particle of separateness of the individual ego, jivatman, the divine purpose in man cannot be utterly accomplished. Therefore Nature or the Will of God—for Nature is nothing but the Will of God in action—has provided that some, having indwelt in God, human soul in divine soul, shall be irresistibly called immediately, with brief respite or at long & last to the utter immersion. These go onward & throw away the last trace of Ego into God. Some of us, it has been said by a great teacher, are jivakotis, human beings leaning so preeminently to the symbol-nature that, if they have lost it utterly for a while in the Reality, they lose themselves; once
immersed, they cannot return; they are lost in God to humanity; others are ishwarakotis, human beings whose centre has already been shifted upwards or, elevated in the superior planes of our conscious-existence from the beginning, was established in God rather than in Nature. Such men are already leaning down from God to Nature; they, therefore, even in losing themselves in Him yet keep themselves since in reaching God they do not depart from their centre but rather go towards it; arrived they are able to lean down again to humanity. Those who can thus emerge from this bath of God are the final helpers of humanity & are chosen by God & Nature to prepare the type of supernatural man to which our humanity is rising.

There are, then, these three divine conditions, states separately conceived of humanity’s God attainment. Man being limited in energy & discriminative rather than catholic in intellect, fastens usually on this separate conception & limits himself to one or other of these conditions; Yogic method, also, being careful of the different natures of men, suits itself to their limitations, becomes selective and concentrates upon one of these conditions or another. Or even it becomes partial as well as selective; for in its contact with God, it relates itself to a part of divine quality rather than the perfect divinity, to a God of mercy, the God of Justice, the Divine Master, the Divine Friend, or else with some aspect of divine impersonal being, to Infinite Rapture, to Infinite Force or to Infinite Calm & Purity. In the indwelling there may be the same limitations, in the becoming also they may persist. There is no fault to be found with this selective process or with this partiality. They are necessary; human limitations demand this device; human perfectibility itself finds its account in these concessions. Nature knows her task & she proceeds to it with a wide, flexible & perfect wisdom which smiles at our impatient logical narrownesses & rigid, onesighted consistencies. She knows she has an infinitely complex & variable material to deal with & must be infinitely complex & variable in her methods. We only consider precise method & ultimate fulfilment; she has to reckon on her way with thousand-armed struggles & infinite possibilities.
Nevertheless, her ultimate aim & the perfect & comprehensive Yoga is that which embraces rather than selects. We are meant to be within the symbol of humanity what God is in Himself & universally. Now God is free, absolute from these limitations & all-comprehensive. He is always one in his being, yet both one with & separate from his symbols & in that differentiated oneness able to stand quite apart from them. So we too in our ultimate divine realisation when we have become one with our divine Self, may & should be able also to stand out as the self still one in all things and beings, yet differentiated in the symbol, so as to enjoy a blissful divided closeness such as that of the Lover & Beloved mingling yet separate in their rapture; & may & should even be able to stand away from God with a sort of entire separateness holding His hand still, unlike the pure dualist, but still standing away from Him so that we may enjoy that infinity of human relation with God which is the wonder & beauty & joy of dualistic religions. To accomplish this is the full, the purna Yoga, and the sadhak who can attain to it, is in his condition the complete Yogan.

Is such a triune condition of the soul possible? Logically, it would seem impossible; logically, all trinities are chimeras and a thing must be one thing at a time & cannot combine three such divergent states as oneness, differentiated oneness & effective duality. But in these matters an inch of experience runs farther than a yard of logic, & experience, you will find, affirms that the triune God-state is perfectly possible & simple once you have attained God's fullness. We must not apply to the soul a logic which is based on the peculiarities of matter. It is true of a clod that it cannot be at the same time a clod hanging up or pasted on some bough, a clod protruding from the earth and a shapeless mass trodden into the mother soil. But this is because the clod is divided from the earthly form. The soul is not divided from God by these barriers of material & dimension. What is true [of] matter is not true of Spirit, nor do the standards of form become facts applied to the formless. For matter is conscious being confined in form, the spirit is conscious being using form but unconfined in it; & it is the privilege of Spirit that though
indivisible in its pure being, it is freely self-divisible in its con-
scious experience & can concentrate itself in many states at a
time. It is by this tapas, by this varied concentration of self-
knowledge that Divine Existence creates & supports the world
& is at one & the same [time] God & Nature & World, Personal
& Impersonal, Pure & Varied, Qualified & without Qualities,
Krishna & Kali, Shiva & Brahma & Vishnu, man & animal &
vegetable & stone, all aspects of Himself & all symbols. We need
not doubt therefore that we, recovering our divine reality, shall
not be bound to a single condition or aspect but can command
a triune or even a multiple soul-experience. We, becoming God,
become that which is the All & exceeds & transcends the All.
Sarvabhutani atmaivabhud vijanatah. The soul of the perfect
knower becomes all existent things & That transcendental in
which all things have their existence, ihaiva, without ceasing to
possess his human centre of separate experience. For this is the
entire divinity that is the result of the perfect & comprehensive
Yoga.
Partial Systems of Yoga

Jnana Yoga: The Yoga of Knowledge

128
All existence is the existence of the One, the Eternal and Infinite, the beginning and middle and end, the source and substance and continent and support of all things. There is not and cannot be any other existence, anything that is other than or outside of or above or below or beyond or in any way separate from the existence of the one Eternal and Infinite. All that appears as finite, temporal, multiple and phenomenal is still in reality being of the being of the Infinite and the Eternal. \textit{Ekam evadvitiyam}.

This is the first and abiding truth without which no other can be understood in the truth of things or put in its proper place in the integrality of the Whole. It is therefore the fundamental realisation at which the seeker of the Yoga must arrive.

129
God is, is the first seed of Yoga. It is Tat Sat of the Vedanta. I am, is the second seed. It is So’ham of the Upanishads. God is infinite self-existence, self-conscious force of existence, self-diffused or self-concentrated delight of existence; I too am that infinite self-existence, self-consciousness, self-force, self-delight; this is the double third seed. It is Sachchidananda of the worldwide transcendental conclusion of all human thinking.

130
Self-knowledge is the foundation of the complete Yoga. Affirm in yourselves self-knowledge.
Self-knowledge and knowledge of the Brahman is one; for I am He. Of this let there be no doubt in thy mind.

Self is twofold, essential and phenomenal, being & becoming[.]

First be aware of thy inner self and spirit. Next be aware of that self and spirit one with thine in others.

All Yoga starts from the perception that what we are now or rather what we perceive as ourselves and so call is only an ignorant partial and superficial formulation of our nature. It is not our whole self, it is not even our real self; it is a little representative personality put forward by the true and persistent being in us for the experience of this brief life; we not only have been in the past and can be in the future but we are much more than that in the present secret totality of our being and nature. Especially, there is a secret soul in us that is our true person; there is a secret self that is our true impersonal being and spirit. To unveil that soul and that self is one of the most important movements of Yoga[.]

The sense of a greater or even of an ultimate Self need not be limited to a negative and empty wideness whose one character is to be without limitation or feature. The first extreme push of our recoil from what we now are or think ourselves to be may and does often at first carry us over into this annihilating experience. A negation of our present error, a release from our petty irksome aching bonds may seem to be the only thing worth having, the only thing true. The rest is infinity, freedom, peace. We feel an Infinity that needs nothing but its own infinite to fill it. We rejoice in a freedom of which any form, name or
description, any creative activity, any movement, any impulse would be a disturbing denial and the beginning of a relapse into the error of will and desire, the ignorance of the illusory finite. To accept nothing but the bare bliss of infinity is the condition of this peace. The mind escaping from itself denies all thought, all form-making, all motion or play of any kind; for that would be a grievous return to itself, a miserable imprisonment and renewed hard-labour. The life released from the toil of labouring and striving and living, demands only immobility and no more to be, a sleep of force, the surety and rest of an immutable status. The body accepts denial and dissolution, for to be dissolved is to cease to breathe and suffer. A bodiless, lifeless, mindless infinite breadth and supreme silence shows to us that we are in contact with the Absolute.

134

This method of extinction is imposed on our mind and our mental ego, because all that is eternal, infinite, absolute is superconscient to mind; mind and its ego cannot remain awake in that greater consciousness, they must disappear. But if we can change or evolve from mental into supramental beings, then the superconscient becomes our normal consciousness. We can then hope to wake in That and not fall asleep in it, to grow into it and not abolish ourselves in it, to last in identity and not lose ourselves in identity with the supreme Existence.

135

It is possible for the reason, the thinker in us to rest and cease satisfied in this sole spiritual experience and to discard all others on the ground that they are in the end illusory or of a minor phenomenal significance. The logical mind drives naturally towards a pursuit of the abstract, towards pure essences, an indefinable substratum of all experiences, a nameless X without contents, an ineffable and featureless Absolute. Itself a creator of definitions without which it cannot think but none of which
can give it any abiding sense of an ultimate, it escapes from itself with a sense of relief into the Indefinable. But if the mind finds its account in cessation and release, the other parts of our being have in this solution to be cast away from us or put to silence. The heart remains atrophied and unfulfilled; the will is baulked of its last dynamic significances. These too tend towards an absolute, the heart towards an absolute of ineffable Love and Bliss, the will towards an absolute of ineffable Power. And there is nothing to prove that the knowledge at which the reason arrives is alone true. There is no reason to suppose that the heart and will and the deeper soul within us have not too their own sufficient doors opening upon the Supreme, their key to the mystery of the Eternal.

**Bhakti Yoga: The Yoga of Devotion**

136

The integral Yoga of Devotion proceeds through seven stages each of which opens out from the one that precedes it:

Aspiration and self-consecration; devotion; adoration and worship; love; possession of the whole being and life by the Divine; joy of the Divine Love and the beauty and sweetness of the Divine; the absolute Bliss of the Absolute.

Faith is our first need; for without faith in the Divine, in the existence and the all-importance of the Divine Being there can be no reason to aspire or to consecrate, there can be no power in the aspiration or force behind the consecration.

Doubts do not matter, if the faith central and fundamental is there. Doubts may come, but they cannot prevail against [the rock] of faith in the centre of the being. The rock may be covered awhile by surges of doubt and despondency, but the rock will emerge firm and indestructible. Faith is of the heart, the inner heart where lives the psychic being. The outer heart is the seat of the vital being, the life personality. That like the mind may
believe and then lose its belief, doubt comes from the mind, the vital and the physical consciousness. [The greater the intensity] of the psychic fire, the less will be the power of doubt to soil and darken the mind, the life and the consciousness of the body.

137

Three are the words that sum up the first state of the Yoga of devotion, faith, worship, obedience.

Three are the words that sum up the second state of the Yoga of devotion, adoration, delight, self-giving.

Three are the words that sum up the supreme state of the Yoga of devotion, love, ecstasy, surrender.

*

These are the seven ecstasies of Love —
The ecstasy of the body in the clasp of the Lover.
The ecstasy of the life consecrated and self-given to the Lord.
The ecstasy of the Mind made one in idea and [will] with the divine Consort.
The ecstasy of the supermind united with mind and body and enjoying the bliss of difference.
The ecstasy [of the] soul in the pure bliss of the Beatific.
The ecstasy of the spirit united in consciousness and force with the Universal.
The ecstasy of the pure being absolute and one with the Transcendent.

Karma Yoga: The Yoga of Works

138

All spiritual paths lead to a higher consciousness and union with the Divine and among the many paths one of the greatest is the
Way of Works: it is as great as the Way of Bhakti or the Way of Knowledge.

Do not imagine that works are in their nature nothing but a bondage, they can be a powerful means towards liberation and divine perfection. All depends on the spirit in our works and their orientation towards the inner and the higher Light away from desire and ego.

Works are a bondage when they are done out of desire or for the sake of the ego, by a mind turned outwards, involved in the act and not detached and free, bound to the ignorance of this lower nature.

To create the union of his soul with the Divine Presence and Power through a perfect surrender of the will in all his activities, is the high aspiration of the seeker on the Way of Works.

To put off like a worn-out disguise the ignorant consciousness and stumbling will that are ours in our present mind and life-force and to put on the light and knowledge, the purity and power, the tranquillity and ecstasy of the divine Essence, the spiritual Nature that awaits us when we climb beyond mind, is the victory after which he reaches.

To make mind and heart and life and body conscious, changed and luminous moulds of this supramental Spirit, instruments of its light and power and works, vessels of its bliss and radiance, is the glory he assigns to his transfigured human members.

On one side a darkened mind and life, ignorant, suffering, spinning like a top whipped by Nature always in the same obscure and miserable rounds, on the other a soul touched by a ray from the hidden Truth, illumined, conscious, concentrated in a single unceasing effort towards its own and the world’s Highest, — this is the difference between man’s ordinary life and the way of the divine Yoga[.]
It is not a mental or moral ideal to which is turned the seeker of the Way, but a truth of the spirit, the experience of a hidden Reality living and concrete, a Light, a Power, a Joy that surpasses the mental understanding and is beyond any merely mental experience.

The ideals created by the mind are constructions in the air that have no sufficient foundation in our vital and physical nature; therefore they can change a side of our mind and colour a part of our actions, but they cannot transform our lives, cannot find here their physical body. Ideals touch and pass, mankind remains the same; after religions, ideals, moralities without end we keep always the same ignorant and imperfect human nature.

Moral rules and ideals are a harness for the ignorant soul, bridle and bit for the passions, reins that compel it to an assigned road, yoke and poles and traces that bind it to be faithful to the burden it carries. Morality checks and controls but does not purify or change the vital nature.

In ethics there is an artificial shaping of the mind's surfaces, but no spiritual freedom, no satisfying perfection of the whole dynamic nature.

The mind's ideals like the life's seekings are at once absolute each in its own demand and in conflict with one another; neither mind nor life knows the means either of their complete or their harmonised fulfilment. The mind labours through the centuries but human nature remains faithful to its imperfections and man's life amid its changes always the same.

Beyond mind on spiritual and supramental levels dwells the Presence, the Truth, the Power, the Bliss that can alone deliver us from these illusions, display the Light of which our ideals are tarnished disguises and impose the harmony that shall at once transfigure and reconcile all the parts of our nature.

* 

The first secret of Yoga is to get back behind the mind to the spirit, behind the surface emotional movements to the soul, —
behind the life to the universal force that builds these outward shapes and movements, — behind matter to the eternal Existence that puts on the robe of the body.

The second secret of Yoga is to open these discovered powers to their own supreme Truth above matter, above life, above the mind. This Truth, secret in the Superconscient, has four gradations or movements of its power, infinite supermind or Gnosis, infinite Bliss, Ananda, infinite Consciousness and Power, Chit-Tapas, infinite Being — Sat-Chid-Ananda.

The third secret of Yoga is, once arisen beyond mind, to bring down the power [sentence not completed]

The progressive surrender of our ignorant personal will and its merger into a greater divine or on the highest summits greatest supreme Will is the whole secret of Karma Yoga. To bring about the conditions in which alone this vast and happy identity becomes possible and to work out the lines we must follow to their end if we are to reach it, is all the deeper purpose of this discipline. The first condition is the elimination of personal vital desire, for if desire intervenes, all harmony with the supreme Divine Will becomes impossible. Even if we receive it, we shall disfigure its working and distort its dynamic impulse. To give up all desire, all insistence upon fruit and reward and success must be renounced from our will and all vital attachment to the work itself excised from our nature; for attachment makes it our own and no longer the Godhead’s. The elimination of egoism is the second condition, not only of the rajasic and tamasic egoisms that twine around desire, but of the sattwic egoism that takes refuge in the idea of the I as the worker.

The ordinary consciousness of man cannot accept this difficult renunciation or, if it accepts it, cannot achieve this tremendous change. The human mind is too ignorant, narrow and chained to its own limited movements, the human life-instincts too blind, selfish, obscure, shut up in their own earth-bound pursuits and
satisfactions, the human body too clumsy and hampering a machine. There is here no freedom, no large and infinite room, no willing and happy plasticity for the greater play of the Divine in Nature. A certain half-seeing and imperfect subordination of the personal will to an ill-understood greater Will and Power, a stumbling and occasional intuition or at best a brilliant lightninglike intimation of its commands and impulsions, a confused, clouded and often grossly distorted execution of the little one seizes of a divine Mandate seems to be the uttermost that the human consciousness as it is at its best seems able to accomplish. Only by a growth into a greater superhuman and supramental consciousness whose very nature is to be attuned to the Divine can we achieve the true and supreme Karma Yoga.

This transformation is only possible after certain steps of a divine ascent have been mastered and to climb these steps is the object of the Yoga of Works as it is conceived by the Gita. The extirpation of desire, a wide and calm equality of the mind, the life soul and the spirit, annihilation of the ego, an inner quietude and expulsion or transcendence of ordinary Nature, the Nature of the three gunas and a total surrender to the Supreme are the successive steps of this preliminary change. Only after all this has been done, can we live securely in an infinite consciousness not bound like our mental human nature. And only then can we receive the Light, know perfectly the will of the Supreme, attune all our movements to the rhythm of its Truth and execute perfectly from moment to moment its imperative commandments. Till then there is no firm achievement, but only an endeavour, seeking and aspiration, all the stress and struggle of a great and uncertain spiritual adventure. Only when these things are accomplished is there for the dynamic parts of our nature the beginning of a divine security in its acts and a transcendent peace.

Desire is always sinning against the Truth; it thins it and prevents it from taking body. Desire does not eternalise descending Truth;
it disintegrates, makes temporal, minimises and soon or at last abandons from dissatisfaction (vairagya) its maimed creation.

142

To do works in a close union and deep communion with the Divine in us, the Universal around us and the Transcendent above us, not to be shut up any longer in the imprisoned and separative human mind, the slave of its ignorant dictates and narrow suggestions, this is Karmayoga.

To work in obedience to a divine command, an eternal Will, a transcendent and universal impulsion, not to run under the whips of ego and need and passion and desire, and not to be goaded by the pricks of mental and vital and physical preference, but to be moved by God only, by the highest Truth only, this is Karmayoga.

To live and act no longer in human ignorance, but in divine Knowledge, conscient of individual nature and universal forces and responsive to a transcendent governance, this is Karmayoga.

To live, be and act in a divine, illimitable and luminous universal consciousness open to that which is more than universal, no longer to grope and stumble in the old narrowness and darkness, this is Karmayoga.

Whosoever is weary of the littlenesses that are, whosoever is enamoured of the divine greatnesses that shall be, whosoever has any glimpse of the Supreme within him or above him or around him let him hear the call, let him follow the path. The way is difficult, the labour heavy and arduous and long, but its reward is habitation in an unimaginable glory, a fathomless felicity, a happy and endless vastness.

Find the Guide secret within you or housed in an earthly body, hearken to his voice and follow always the way that he points. At the end is the Light that fails not, the Truth that deceives not, the Power that neither strays nor stumbles, the wide freedom, the ineffable Beatitude.

The heavens beyond are great and wonderful, but greater
and more wonderful are the heavens within you. It is these Edens that await the divine worker.

143

A peace and bliss inconceivable to the pleasure-bound and pain-racked mind, and immeasurable by the limited capacities of our present bodily sense, is the reward of the seeker’s insistent self-discipline, his painful struggle, his untiring endeavour.

*

At first a consecration, then a surrender and subordination of our human personal will, then its merger in a greater divine or greatest supreme Will is the central secret and core of intention of the Karmayoga. But this cannot be entirely done by our mental consciousness in its little human boundaries. Our Yoga must help us to leave it and enter into a greater consciousness enlightened by a truer radiance of knowledge, armed with a mightier unerring strength, open to that vaster delight in which are drowned for ever our petty human pain and pleasure. Still even what can be done within the limits of our human consciousness brings a great liberation.

But even to do that little is not easy to the physical mind of man, even when his higher mind and will consent and demand it. There is something in us wedded to ignorance, eternally in revolt against all surrender, attached to its own blind activity, its own freedom of will, a “freedom” that rattles its hundred chains at every step; — but to that element in us even that seems a divine music. And our human mind will invent a hundred good reasons against any such surrender to something not ourselves or even to our highest Self, — unless that be nothing more than a magnified reflection of our ego; for then it will be willing enough to surrender. And even our highest spiritual achievement on the mental plane is tainted and limited, when it is not distorted, by this ever unredeemed element in our nature.
Our only safety is to push on beyond the mind to a Truth-consciousness with a larger dynamic light in it that is ever free by its inherent knowledge and illumined power from these pettinesses and this egoistic darkness. For in this supramental consciousness is the Truth and there we meet it and its Master. The supermind is the primal creative and organic instrument of the Supreme Will, the Will that is free from error because eternal, one and infinite.
Integral Yoga

Integrality

144
Most Yoga has for its aim one or other of two great ends, either the abandonment of the world and departure into some reality of supracosmic existence or some form of limited perfection, knowledge, bliss or mastery in the world. But there is a third objective of Yoga in which there is a harmony between world existence & supracosmic freedom. God is possessed; the world is not renounced or rather renounced as an aim in itself, but possessed as the play of God. A selfless and transcendent perfection in the divine existence is the goal in this path of Yoga.

145
There are many Yogas, many spiritual disciplines, paths towards liberation and perfection, Godward ways of the spirit. Each has its separate aim, its peculiar approach to the One Reality, its separate method, its helpful philosophy and its practice. The integral Yoga takes up all of them in their essence and tries to arrive at a unification (in essence, not in detail) of all these aims, methods, approaches; it stands for an all-embracing philosophy and practice.

146
To enter into the entire consciousness of the Divine Reality with all our being and all parts and in every way of our being and to change all our now ignorant and limited nature into divine nature so that it shall become the instrument and expression of the
Divine Reality that in our self and essence we are, — this is the complete fulfilment of our existence and this is the integral Yoga.

To enter into the Divine either by the way of the thinking mind or by the way of the heart or by the way of the will in works or by a change of the psychological nature-stuff or a freeing of the vital force in the body is not enough; all this is not enough. Through all these together it must be done and by a change of our very sense and body consciousness even to the material inconscience which must become aware of the Divine and luminous with the Divine.

To be one with the Divine, to live in and with the Divine, to be of one nature with the Divine, this should be the aim of our Yoga.

The integral Yoga is so called because it aims at a harmonised totality of spiritual realisation and experience. Its aim is integral experience of the Divine Reality, what the Gita describes in the words *samagram mam,* “the whole Me” of the Divine Being. Its method is an integral opening of the whole consciousness, mind, heart, life, will, body to that Reality, to the Divine Existence, Consciousness, Beatitude, to its being and its integral transformation of the whole nature[].

Our Yoga is the integral Yoga. Its object is the harmony of a total spiritual realisation and experience, a supreme consummation of the spirit and the nature.

This Yoga is called the integral Yoga, first because its object is integral covering the whole field of spiritual realisation and experience. It takes existence at its centre and in all its aspects and turns it into a harmony at once single and entire. It is the method
What is the integral Yoga?

It is the way of a complete God-realisation, a complete Self-realisation, a complete fulfilment of our being and consciousness, a complete transformation of our nature — and this implies a complete perfection of life here and not only a return to an eternal perfection elsewhere.

This is the object, but in the method also there is the same integrality, for the entirety of the object cannot be accomplished without an entirety in the method, a complete turning, opening, self-giving of our being and nature in all its parts, ways, movements to that which we realise.

Our mind, will, heart, life, body, our outer and inner and inmost existence, our superconscious and subconscious as well as our conscious parts, must all be thus given, must all become a means, a field of this realisation and transformation and participate in the illumination and the change from a human into a divine consciousness and nature.

This is the character of the integral Yoga.

The integral Yoga is a single but many-sided way of the growth of our spirit and development of our nature. A total experience and a single and all embracing realisation of the integral Divine Reality is its consequence. There is too implied in it a radical change and transformation of the whole being and of every part of the nature. Our being is a nexus of the human mental-vital-physical nature of Ignorance, it is transmuted into a spiritual and supramental consciousness: it becomes a divine unity in a harmony of the infinite and universal and integrated will, love, bliss and knowledge.
The Infinite Reality presents itself to our limited consciousness in an infinity of aspects; different ways of Yoga try to realise one or other of these aspects. The integral Yoga takes all of them in its movement, but it limits itself to no aspect; its sole desire is to embrace the whole Divinity (samagram mam — Gita).

A highest aspect of the infinite Reality is the supracosmic Absolute, unthinkable, ineffable, without relation to the universe. There is a path of Yoga that [sentence not completed]

The heart of the integral Yoga is in a triple spiritual endeavour. It is a realisation of the Divine, of all the Divine by our whole being and through all the parts of our being. It includes a discovery and harmonisation, a unification of our total consciousness subliminal as well as supraliminal, the now superconscient and subconscious as well as the now conscious and its surrender to the Divine for a spiritual instrumentation here; it culminates in an evolution of this consciousness [sentence not completed]

The integral Yoga is integral by the totality or completeness of its aim, the completeness of its process and the completeness of the ground it covers in its process. This kind of integrality must by its nature be complex, manysided and intricate; only some main lines can be laid down in writing, for an excess of detail would confuse the picture.

The aim the Yoga puts before itself is in essence the same as the object of other Yogas — the realisation of the Divine. But it is not the Divine in one of its aspects, personal or impersonal, cosmic or transcendent, Self or Lord or [sentence not completed]

That Yoga is full or perfect which enables us to fulfil entirely God's purpose in us in this universe.

All Yoga which takes the soul entirely out of world-existence, is a high but narrow specialisation of divine tapasya.
God’s purpose in us is that we should fulfil His divine being in world-consciousness under the conditions of the Lila.

With regard to the universe God manifests Himself triply, in the individual, in the universe, in that which transcends the universe.

In order to fulfil God in the individual, we must exceed the individual. The removal of limited ego and the possession of cosmic consciousness is the first aim of our sadhana.

In order to fulfil God in the cosmos, individually, we must transcend the universe. The ascension into transcendent consciousness is the second aim of our sadhana.

All Yoga aims at oneness or union or a close communion or contact with the Divine, infinite and eternal. To reach to this union or come by this contact it is necessary to enter or at least open into a greater consciousness than that of the human mental being who is shut up in the limitations of an individualised living body. To arrive wholly at the union or the constant communion one must enter the consciousness of the Divine, — whether into its infinite cosmic consciousness or that of its supracosmic eternity. Or else, uniting both these terms, one may add to them that of the individualised Divine in oneself and through this trinity arrive at a perfect union, one, satisfying and complete.

But the Divine Consciousness can manifest itself through any and every plane, on the mental, on the vital, on the physical, or on those which are higher than the mental[.]

All Yoga done through the mind alone or through the heart or the will or the vital force or the body ends in some one aspect of the infinite and eternal Existence and rests satisfied there, as the mind imagines for ever. Not through these alone shall thy Yoga move, but through all these at once and, supremely, through that which is beyond them. And the end of thy Yoga shall be the
integrality of thy entrance not into one aspect, but into all the Infinite, all the Eternal, all the Divine in all its aspects indivisibly unified together.

Whatever is beyond mind and life and body is spirit. But spirit can be realised even on these lower levels, in the spiritualised mind, in the spiritualised life-force, even in the spiritualised physical consciousness and body. But if thou rise not up beyond the mind-level, then in these realisations the spirit must needs be modified by the medium through which thou attainest to it and its supreme truth can only be seized in a reflection, partial even in widest apparent universality, and the utmost essential integrality will escape thy seizure.

Rise rather into the supramental levels and then all the rest shall remain a part of thy experience, but wonderfully changed, transfigured by a supreme alchemy of consciousness into an element of the supramental glory. All that other Yogas can give thee, thou shalt have, but as an experience overpassed, put in its place in the divine Whole and delivered from the inadequacy of an exclusive state or experience.

The Supramental Yoga

156

All Yoga is in its very nature a means of passing out of our surface consciousness of limitation and ignorance into a larger and deeper Reality of ourselves and the world and some supreme or total Existence now veiled to us by this surface. There is a Reality which underlies everything, permeates perhaps everything, is perhaps everything but in quite another way than the world now seen by us; to It we are obscurely moving by our thought, life and actions; we attempt to understand and approach by our religion and philosophy, at last we touch directly in some partial or, it may be, some complete spiritual experience. It is that spiritual experience, it is the method, it is the attainment of this realisation that we call Yoga.
But the Reality is an Absolute or an Infinite; our consciousness, even our spiritualised consciousness is that of a finite being. It is inevitable therefore that our spiritual experience should be not that of a concrete integrality of this Absolute or Infinite, but of aspects of it; we are, so long at least as we are mental beings, the blind men of the story trying to tell what the Elephant Infinite is in its totality by our touch upon a part of it, some member of its spiritual body, tanum svam. One experiences it as Self or Spirit. It may be a Self of himself in which he finds his spiritual consummation, integrality, infinity, perfection. It may be a Self of the universe in which his individuality loses itself forever. It may be a Self transcendent in which the Ego disappears, but cosmos too is annulled forever in a formless Eternal and Infinite. Another may experience it as God; and God may be either the All of the Pantheist, a cosmic Spirit, an individual Deity, a supracosmic Creator; or all of these together. A Personal Godhead may be the spiritual Form in which He presents Himself to us or rather He may reject forms from his being [and] resolve Himself into an impersonal Existence. Moreover each of these aspects of the Reality can be variously experienced; for each suits itself to the grasp of our consciousness, even though it can be very apparent that it is the same Reality that these variations differently account for. But also there may [be] other realisations of the Reality such as the Zero of the Nihilistic Buddhists which is yet a mysterious All, a negation that is a positive Permanence. It is an error to take these variations as a proof that spiritual experience is unreliable. All religions, all philosophies are equally desperate in their attempts to give an account of the Real and Ultimate; science itself for all its matter of fact physical positivism draws back bewildered from the attempt to touch the Real and Ultimate. It is the nature of Mind to arrive at this result of uncertain certainty; our experience is true but it is not and cannot be the sole possible integral experience.

All human Yoga is done on the heights or levels of the mental
nature; for man is a mental being in a living body. But mind if it is able to reflect some light of the divine Truth or even admit some emanations from her power, is incapable of embodying her.

There is an eternal dynamic Truth-consciousness beyond mind; this is what we call supermind or gnosis.

For mind is or can be a truth seeker, but not truth-conscious in its inherent nature; its original stuff is made not of knowledge, but of ignorance.

All Yoga has one supreme object; a permanent liberation from the ignorance and weakness of this limited and suffering human and earthly consciousness is its purpose and either an escape or a growth and swift flowering into a greater consciousness beyond mind, life and body, into a wider and diviner existence.

But this greater consciousness is differently conceived by different seekers, for in itself it is to the mind unseizable infinitely. One, but multitudinously one, it presents itself in a million aspects. To some it appears as a great permanent Negative or a magnificent, a happy annihilation of all that we know as an existence. To others it is a featureless Absolute; the annihilation of personality and world-Nature is its key and silence and an ineffable peace its gate of our entrance. To others it is a Supreme, positive beyond all positives, an Existence, an absolute Consciousness, an illimitable Beatitude. To others it is the one Divine beyond all Divinities, an ineffable Person of whom all these three supreme things are the attributes. And so through an endless chapter. As is the power of our spirit and the cast of our nature, so we conceive of the one Eternal and Infinite.

This Eternal and Infinite, however we conceive it, is the one ultimate aim of Yoga. Other smaller aims there are that can be achieved by it and are pursued by many seekers; but these are crowns of the wayside or even flowers of the bye-paths and their pursuit for their own sake may lead us far aside or far away from our eternal home.
The object of supramental Yoga combines all the others, but uplifts and transforms the smaller aims into a part of the completeness of the one supreme object.

Not to lose oneself altogether in some ineffable featurelessness is its object, but to renounce ego for our true divine person one with the universal and infinite; not to abolish consciousness, but to exchange ignorance for a supreme and all-containing Knowledge, not to blot out joy but to renounce human pleasure for a divine griefless beatitude, not to give up but to transform all world-nature and world-existence into a power of the Truth of the Divine Existence. Asceticism is not the final condition or characteristic means of this Yoga, although it does not exclude, whenever that is needful ascetic self-mastery or ascetic endeavour.

To become one in our absolute being with the ineffable Divine and in the manifestation a free movement of his being, power, consciousness and self-realising joy, to grow into a divine Truth-consciousness beyond mind, into a Light beyond all human or earthly lights, into a Power to which the greatest strengths of men are a weakness, into the wisdom of an infallible gnosis and the mastery of an unerring and unfailing divinity of Will, into a Bliss beside which all human pleasure is as the broken reflection of a candle-flame to the all-pervading splendour of an imperishable sun, but all this not for our own sake [but] for the pleasure of the Divine Beloved, this is the goal and the crown of the supramental path of Yoga.

This change is a thing in Nature and not out of Nature; it is not only possible, but for the growing soul inevitable. It is the goal to which Nature in us walks through all this appearance of ignorance, error, suffering and weakness.

The supramental Yoga is at once an ascent of the soul towards God and a descent of the Godhead into the embodied nature.

The ascent demands a one-centred all-gathering aspiration
of soul and mind and life and body upward, the descent a call of
the whole being towards the infinite and eternal Divine. If this
call and this aspiration are there and if they grow constantly
and seize all the nature, then and then only its supramental
transformation becomes possible.

There must be an opening and surrender of the whole nature
to receive and enter into a greater divine consciousness which
is there already above, behind and englobing this mortal half-
conscious existence. There must be too an increasing capacity
to bear an ever stronger and more insistent action of the divine
Force, till the soul has become a child in the hands of the infinite
Mother. All other means known to other Yoga can be used and
are from time to time used as subordinate processes in this Yoga
too, but they are impotent without these greater conditions, and,
once these are there, they are not indispensable.

In the end it will be found that this Yoga cannot be carried
through to its end by any effort of mind, life and body, any
human psychological or physical process but only by the action
of the supreme Shakti. But her way is at once too mysteriously
direct and outwardly intricate, too great, too complete and sub-
tle to be comprehensively followed, much more to be cut out
and defined into a formula by our human intelligence.

Man cannot by his own effort make himself more than
man, but he can call down the divine Truth and its power to
work in him. A descent of the Divine Nature can alone divinise
the human receptacle. Self-surrender to a supreme transmuting
Power is the key-word of the Yoga.

This divinisation of the nature of which we speak is a meta-
morphosis, not a mere growth into some kind of superhumanity,
but a change from the falsehood of our ignorant nature into the
truth of God-nature. The mental or vital demigod, the Asura,
Rakshasa and Pishacha, — Titan, vital giant and demon, — are
superhuman in the pitch and force and movement and in the
make of their characteristic nature, but these are not divine and
those not supremely divine, for they live in a greater mind power
or life power only, but they do not live in the supreme Truth,
and only the supreme Truth is divine. Only those who live in a
supreme Truth consciousness and embody it are inwardly made or else remade in the Divine image.

The aim of supramental Yoga is to change into this supreme Truth-consciousness, but this truth is something beyond mind and this consciousness is far above the highest mind-consciousness. For truth of mind is always relative, uncertain and partial, but this greater Truth is peremptory and whole. Truth of mind is a representation, always an inadequate, most often a misleading representation, and even when most accurate, only a reflection, Truth's shadow and not its body. Mind does not live in the Truth or possess but only seeks after it and grasps at best some threads from its robe; the supermind lives in Truth and is its native substance, form and expression; it has not to seek after it, but possesses it always automatically and is what it possesses. This is the very heart of the difference.

The change that is effected by the transition from mind to supermind is not only a revolution in knowledge or in our power for knowledge. If it is to be complete and stable, it must be a divine transmutation of our will too, our emotions, our sensations, all our power of life and its forces, in the end even of the very substance and functioning of our body. Then only can it be said that the supermind is there upon earth, rooted in its very earth-substance and embodied in a new race of divinised creatures.

Supermind at its highest reach is the divine Gnosis, the Wisdom-Power-Light-Bliss of God by which the Divine knows and upholds and governs and enjoys the universe.

The supramental Yoga is a path of integral seeking of the Divine by which all that we are is in the end liberated out of the Ignorance and its undivine formations into a truth beyond the Mind, a truth not only of highest spiritual status but of a dynamic spiritual self-manifestation in the universe.

The object of this Yoga is not to liberate the soul from Nature, but to liberate both soul and nature by sublimation into
the Divine Consciousness from whom they came.

The aim of the ordinary Yoga is to liberate the soul from Nature or, perhaps sometimes, to liberate the soul in Nature.

Our aim is to liberate both soul and nature into the Divine. Our aim is to pass from the Ignorance into the Divine Light, from death into Immortality, from Desire into self-existent Bliss, from limited human-animal consciousness into all-consciousness and God-consciousness, from the ignorant seeking of Mind into the self-existent knowledge of Supermind, from obscure half animal life into luminous God-force, from the material consciousness [sentence not completed]

161

It is at the high line where the surrender can become absolute that a divine gnostic consciousness commences and the first authentic and unconditioned workings of the supramental Nature.

162

The first word of the supramental Yoga is surrender; its last word also is surrender. It is by a will to give oneself to the eternal Divine, for lifting into the divine consciousness, for perfection, for transformation, that the Yoga begins; it is in the entire giving that it culminates; for it is only when the self-giving is complete that there comes the finality of the Yoga, the entire taking up into the supramental Divine, the perfection of the being, the transformation of the nature.

The Yoga of Transformation

163

This is a Yoga of transformation of the being, not solely a Yoga of the attainment of the inner Self or the Divine, though that
attainment is its basis without which no transformation is possible. In this transformation there are four elements, the psychic opening, the transit through [the] occult, the spiritual release, the supramental perfection. If any of the four is unachieved, the Yoga remains incomplete.

I mean by the psychic the inmost soul-being and the soul nature. This is not the sense in which the word is used in ordinary parlance, or rather, if it is so used, it is with great vagueness and much misprision of the true nature of this soul and it is given a wide extension of meaning which carries it far beyond that province. All phenomena of an abnormal or supernormal psychological or an occult character are dubbed psychic; if a man has a double personality changing from one to another, if an apparition of a dying man, something of his mere vital sheath or else a thought-form of him, appears and stalks through the room of his wondering friend, if a poltergeist kicks up an unseemly row in a house, all that is classed under psychic phenomena and regarded as a fit object for psychic research, though these things have nothing whatever to do with the psyche. Again much in Yoga itself that is merely occult, phenomena of the unseen vital or mental or subtle physical planes, visions, symbols, all that mixed, often perturbed, often shadowy, often illusory range of experiences which belong to this intervening country between the soul and its superficial instruments or rather to its outermost fringes, all the chaos of the intermediate zone, is summed up as psychic and considered as an inferior and dubious province of spiritual discovery. Again there is a constant confusion between the mentalised desire-soul which is a creation of the vital urge in man, of his life-force seeking for its fulfilment and the true soul which is a spark of the Divine Fire, a portion of the Divine. Because the soul, the psychic being uses the mind and the vital as well as the body as instruments for growth and experience it is itself looked at as if it were some amalgam or some subtle substratum of mind and life. But in Yoga if we accept all this chaotic mass as soul-stuff or soul-movement we shall enter into a confusion without an issue. All that belongs only to the coverings of the soul; the soul itself is an inner divinity greater than mind
or life or body. It is something that once it is released from obscurcation by its instruments at once creates a direct contact with the Divine and with the self and spirit.

164

In the integral Yoga there is a progressive discovery of our spiritual status; this progression is accompanied by a dynamic new-creation of our nature. A triple transformation is its process and the revelation of its entire significance.

A first discovery is the unveiling of the soul out of its disguising mask, concealing curtain, blockading wall of mind, life and body — the psychic entity, the divine element in our nature which gives it its permanence and immortality, becomes the open ruler of our instruments and transmutes them into conscious spiritualised agents so that they are no longer a changing formulation of the nature of the Ignorance.

165

Yoga is not only a discovery of our concealed spiritual status but a dynamic spiritual self-creation; a triple transformation is the heart of its process and the revelation of its entire significance.

Its first step is the unveiling of the soul; for there is a secret psychic being, a divine element in our depths that is concealed even more than garbed by the mind, body and life. To bring it

\[1 \text{ Reproduced below is another, incomplete version of this passage:} \]

Its first step is the unveiling of the soul, the psychic entity, now covered by the superficial activity of mind and life and body. The soul is the deep hidden natural divine element in us, a permanent portion of the Godhead which persists in a spiritual permanence and ensures our immortality of being; for without it there could be only a temporary mechanical formation and action of nature-energy and its phenomenon of substance. This unveiling is accompanied by a psychic transformation of the nature; mind, life and body become truly ensouled and ready for a spiritual change.

Its second step is the revelation of a self and spirit which supports our individual soul manifestation and soul development, but knows itself to be one being with cosmic Godhead and universal Nature and can stand back from that even as a transcendent spirit. By this discovery the being in us exceeds its separate individuality, enters into a cosmic consciousness, is released into a supracosmic transcendence.

www.holybooks.com
out of its seclusion where it lives like a spiritual king without apparent power served and replaced by its ministers, so that it may take over the whole active government of the nature is the first great unfolding, the initial potent self-discovery of the Yoga. Mind the thinker is the prime minister in us who covers the king, but mind too is dominated and led by the vital powers, the strong and violent of the realm, who force it to serve their purpose and these too can only act with the means given them by the body and physical nature, the inert hardly conscious subject existence whose passive assent and docile instrumentation is yet indispensable to its rulers. This is our present constitution and it amounts to no more than a sort of organised confusion, a feudal order that is an ignorant half anarchy and cannot make the most of the possibilities and resources even of the limited tract of nature which we inhabit, much less reveal to us and exploit our spiritual empire. To reinstate the king-soul is the first step in a needed revolution — the soul directing the mind will exercise through it its sovereign power over the powers of life and subject to them in their turn an enlightened and psychically consenting body. But this is not all; for soul-discovery is not complete without a psychic new creation of the mental, vital and physical instrumentation of nature. The mind will be recast by the soul’s intuition of Truth, the vital being by its perception of power and good, the body and whole nature by its command for light, harmony and beauty. Our nature will become that of a true psychic entity, not a brute creation unified by a precarious life and illumined by the candlelight of a struggling intelligence.

I mean by the integral Yoga a manysided way or means of self-liberation and self-perfection, a radical change of our entire being by which we grow out of its present mental, vital and physical human ignorance into a large and integral spiritual and divine Consciousness; — as a result of this liberation, this change or transformation there is a union in the spirit with our Divine Origin in its integral Reality, an ascent of all our being...
and nature into the Divine Existence, the Divine Consciousness, the Divine Bliss or Ananda, and a descent of the Divine infinite Wideness, Light, Knowledge, Force, Joy, Ananda into our entire nature.

167

Our Yoga is a Yoga of transformation, but a transformation of the whole consciousness and the whole nature from the top to the bottom, from its hidden inward parts to its most tangible external movements. It is neither an ethical change nor a religious conversion, neither sainthood nor ascetic control, neither a sublimation nor a suppression of the life and vital movements that we envisage, nor is it either a glorification or a coercive control or rejection of the physical existence. What is envisaged is a change from a lesser to a greater, from a lower to a higher, from a surface to a deeper consciousness — indeed to the largest, highest, deepest possible and a total change and revolution of the whole being in its stuff and mass and every detail into that yet unrealised diviner nature of existence. It means a bringing forward of what is now hidden and subliminal, a growing conscious in what is now superconscient to us, an illumination of the subconscious and subphysical. It implies a substitution of the control of the nature by the soul for its present control by the mind; a transference of the instrumentation of the nature from the outer to the now more than half-veiled inner mind, from the outer to the inner vital or life-self, from the outer to an inner subtler vaster physical consciousness and by this transference a direct and conscious instead of an indirect and unconscious or half conscious contact with the secret cosmic forces that move us; a breaking out from the narrow limited individual into a wide cosmic consciousness; an ascension from mental to spiritual nature; a still farther ascension from the spirit in mind or overspreading mind to the supramental spirit and a descent of that into the embodied being. All that has not only to be achieved but organised before the transformation is complete.
The ascent to supermanhood will be a radical change of consciousness, force and bliss-power, a potent building of all that is necessary to manifest the new godhead in mind, life and body. There will be at once an inner revelation and an outer transformation. Something will be born that was not here or was latent and hidden in its own invisible radiances and at the same time there will be a metamorphosis and reversal in our existing structure.

A creation by a consensus of superior and nether powers is the condition demanded by the Spirit for its decisive works; and this double action, this meeting, consensus, unification of the superconscient and subconscient gods in a growing consciousness is the key to the critical revolutions of Nature.

The creation of conscious supermind on the terrestrial plane will be done therefore not only from above by the Spirit but from below by the Earth-Power. The sun of supramental Truth will descend into the body, but also it will awake another secret sun of supramental Truth that was asleep in the foundations and very principle of Matter.

The boon that we have asked from the Supreme is the greatest that the earth can ask from the Highest, the change that is most difficult to realise, the most exacting in its conditions. It is nothing less than the descent of the supreme Truth and Power into Matter, the supramental established in the material plane and consciousness and the material world and an integral transformation down to the very principle of Matter. Only a supreme Grace can effect this miracle.

The supreme Power has descended into the most material consciousness but it has stood there behind the density of the physical veil demanding before manifestation, before its great open workings can begin, that the conditions of the supreme Grace shall be there, real and effective. And the first condition is
that the Truth shall be accepted within you entirely and without reserve before it can be manifested in the material being and Nature.

A total surrender, an exclusive self-opening to the divine influence, a constant and integral choice of the Truth and rejection of the falsehood, these are the only conditions made. But these must be fulfilled entirely, without reserve, without any evasion or pretence, simply and sincerely down to the most physical consciousness and its workings.

Victory in this effort depends upon the sincerity within you, the purity of your aspiration, the burning core of your faith, the absoluteness of your will and surrender.

Two things are needed if thou wouldst follow the steep and difficult way of Yoga, the need and will within thee and the call of the Spirit.

The need is the need of the soul, awakened or awaking or striving to come to the surface. For all other may be transitory or false; but the soul’s need is lasting and true.

Thy soul’s need of divine light and the spirit’s perfection can alone bear thee across the darkness of the many nights through which thou must pass, beyond the open or hidden pitfalls of the road, past the dangers of the precipice and the morass, through the battle with giant forces and the clutching of hands that mislead and the delusions of the night and the twilight, through false light and illusive glamour, triumphant over the blows and ordeals and nets and temptations of the gods and on and up to the immeasurable summits.
Part Three

Notes and Fragments on Various Subjects

The pieces collected in this part were written by Sri Aurobindo at different times and for various purposes. They have been arranged by the editors by subject in five sections.
Section One

The Human Being in Time
The Marbles of Time

Institutions, empires, civilisations are the marbles of Time. Time, sitting in his banqueting hall of the Ages, where prophets and kings are the spice of his banquet, drinking the red wine of life and death, while on the marble floor at his feet are strewn like flowers the images of the same stars that shone on the pride of Nahusha, the tapasya of Dhruv and the splendours of Yayati, that saw Tiglath-Pileser, Sennacherib and the Egyptian Pharaohs, Pompey’s head hewn off on the sands of Egypt and Caesar bleeding at Pompey’s sculptured feet, Napoleon’s mighty legions thundering victorious at the bidding of that god of war on the field of Austerlitz and Napoleon’s panic legions fleeing disordered with pursuit and butchery behind them from that last field of Waterloo,—Time, the Kala Purusha, drunk with the fumes of death and the tears and laughter of mortals, sits and plays there with his marbles. There are marbles there of all kinds, marbles of all colours, and some are dull and grey, some glorious with hearts of many colours, some white and pure as a dove’s wings,—but he plays with them all equally and equally he thrusts them all away when he has done with them. Sometimes even, in his drunkenness, he hurls them out of his window or lifts his mace and deals blows here and there smashing into fragments the bright and brittle globes, and he laughs as they smash and crumble. So Time, the god, sits and plays for ever with his marbles.
A Theory of the Human Being

It is a superstition of modern thought that the march of knowledge has in all its parts progressed always in a line of forward progress deviating from it, no doubt, in certain periods of obscuration, but always returning and in the sum constituting everywhere an advance and nowhere a retrogression. Like all superstitions this belief is founded on bad and imperfect observation flowering into a logical fallacy. Our observation is necessarily imperfect because we have at our disposal the historical data and literary records of only a few millenniums and beyond only dissected and insufficient indices which leave gigantic room for the hardly-fettered activity of the mind’s two chief helpers and misleaders, inference and conjecture. Our observation is bad because, prepossessed by the fixed idea of a brief & recent emergence from immemorial barbarism, imagining Plato to have blossomed in a few centuries out of a stock only a little more advanced than the South Sea islander, we refuse to seek in the records that still remain of a lost superior knowledge their natural and coherent significance; we twist them rather into the image of our own thoughts or confine them within the still narrow limits of what we ourselves know and understand. The logical fallacy we land in as the goal of our bad observation is the erroneous conception that because we are more advanced than certain ancient peoples in our own especial lines of success, as the physical sciences, therefore necessarily we are also more advanced in other lines where we are still infants and have only recently begun to observe and experiment, as the science of psychology and the knowledge of our subjective existence and of mental forces. Hence we have developed the exact contrary of the old superstition that the movement of man is always backward to retrogression. While our forefathers believed that the more ancient might on the whole be trusted
as more authoritative, because nearer to the gods, and the less ancient less authoritative because nearer to man’s ultimate degeneracy, we believe on the contrary that the more ancient is always on the whole more untrue because nearer to the unlettered and unenquiring savage, the more modern the more true because held as opinion by the lettered and instructed citizen of Paris or Berlin. Neither position can be accepted. Verification by experience & experiment is the only standard of truth, not antiquity, not modernity. Some of the ideas of the ancients or even of the savage now scouted by us may be lost truths or statements of valid experience from which we have turned or become oblivious; many of the notions of the modern schoolmen will certainly in the future be scouted as erroneous and superstitious.

Among the ancient documents held by the ancients to be deep mines of profound and fertile truth but to us forgetful and blind of their meaning the Veda & Upanishads rank among the very highest.
A Cyclical Theory of Evolution

[.....] Driven from all other fields by a perception of the slow and aeonic processes of Nature, the mushroom theory of existence took refuge in this ill-explored corner of scientific theory. Thence, although later discoveries have had an enlarging effect, it still hampers the growth of more thoughtful generalisations. The time-limit allowed for the growth of civilisation is still impossibly short and in consequence an air of unreality hangs over the application of the evolutionary idea to our human development. Nor is this essential objection cured by any evidence of the modernity of human civilisation. Its great antiquity is denied merely on the absence [of] affirmative data; there are no positive indications to support the denial; but where data are scanty, such a negative basis is in the last degree unsound and precarious. We can no longer argue that no ancient civilisations can have existed of which the traces have entirely perished and that prehistoric means, necessarily, savage and undeveloped. History on the contrary abounds with instances of great societies which were within an ace of disappearing without leaving any visible memorial behind them and recent excavations have shown that such disappearances in ancient times have been even not uncommon. We cannot have exhausted all that the earth contains. There should be the remains of other civilisations yet undiscovered & there may well have been yet others which because of the manner of their disappearance or for other causes have left no traces at all whether upon the surface of the earth or under it. Indeed with regard to no object or previous existence, no silent or imperfectly documented [scene], is it safe to argue that because there are no traces or sufficient evidence of it, therefore it never existed. Yet in many fields of generalisation modern scholarship has used substantially this argument with a prodigal freedom. It is at least possible that mighty cities and noble civilisations filled with their
rumour the now silent spaces of Time for countless millenniums before Egypt and Assyria rose into their historic greatness.

Brief lapse of time is not indeed the cardinal point of the savage theory and even if larger time-spaces are allowed, the theory itself need not fall. But I have urged the question of time as of primary moment not for the overthrow of the modern explanation but for the readmission of another and more ancient synthesis. For if once we allow the existence of prehistoric civilisations older, it would seem, than the Egyptian, — such as may be argued from the deep-buried cities of Asia, — and the presence in an unknown antiquity of great national cultures where now the savage or the semi-savage swarm uncreative and unreflecting, — such as may be argued from the ruins of Mashonaland or the state of mediaeval Barbary after the ravages of Moor and Vandal or even the fate which overtook for almost a millennium the magnificent structure of Graeco-Roman culture and threatened even to blot out its remnants and ruins, — the question then arises, what was the nature of these forgotten civilisations and how was the relapse to barbarism often of an extreme form, so completely effected. These gigantic spaces of time, this worldwide rise and fall of human society, this swaying to and fro from darkness to light and light to darkness leave the ground open for another explanation which is in some respects the reverse of the savage theory, — for the Hindu explanation.

For the Hindu mind has never admitted the principle in Nature of progress in a straight line. Progress in a straight line only appears to occur and so appears only because we concentrate our scrutiny on limited sections of the curve that Nature is following. But if we stand away from this too near and detailed scrutiny and look at the world in its large masses, we perceive that its journeying forward has no straightness in it of any kind but is rather effected in a series of cycles of which the net result is progress. The image of this apparent straight line is that of the ship which seems to its crew to be journeying on the even plain of the waters but is really describing the curve of the earth in a way perceptible only to a more distant and instructed vision. Moreover even the small section of the curve which we are
examining & which to our limited vision seems to be a straight line is the result of a series of zigzags and is caused by the conflict of forces arriving by a continual struggle at a continual compromise or working out by their prolonged discord a temporary harmony. The image of the actual progress in cycles is the voyaging in Space of the planets which describe always the same curve round their flaming & luminous sun, image of the perfect strength, joy, beauty, beneficence and knowledge towards which our evolution yearns. The cycle is always the same ellipse, yet by the simultaneous movement of the whole system the completed round finds the planet at a more advanced station in Space than its preceding journey. It is in this way, by an ever-swaying battle, a prodigal destruction and construction, a labouring forward in ever-progressing curves and ellipses that Nature advances to her secret consummation.

These are the conceptions we find expressed in the Puranic symbols familiar to our imagination. There is the Kalpa of a thousand ages with its term of fourteen Manwantaras dividing a sub-cycle of a hundred chaturyugas; there is the dharma, the well-harmonised law of being, perfect in the golden period of the Satya, impaired progressively in bronze Treta and copper Dwapara, collapsing in the iron Kali only to open the way by its disintegration to the manifestation in the next Satya of the old law, truth or natural principle of existence arranged in a new harmony. There is throughout this zigzag, this rhythm of rise and fall and rise again brought about by the struggle of upward, downward and stationary forces. There are the alternate triumphs of deva and daitya, helping god and opposing or too violently forward-striving Titan; — the dharmasya glani and abhyutthanam adharmasya, when harmony is denied and discord or wrong harmony established, and then the Avatara and the dharmasya sansthapanam, eternal Light and Force descending, restoring, effecting a new temporary adjustment of the world’s ways to the truth of things and of man.

Translated into more modern but not necessarily more accurate language these symbols point us to a world history not full of the continual, ideal, straightforward victory of good and
truth, not progress conceived as the Europeans conceive it, a continual joyous gallop through new & ever new changes to an increasing perfection, but rather of the alternately triumphant forces of progress and regression, a toiling forward and a sliding backward,—the continual revolution of human nature upon itself which yet undoubtedly has but conceals & seems not to have its secret of definite aim and ultimate exultant victory. In certain respects the old Vedantic thinkers anticipate us; they agree with all that is essential in our modern ideas of evolution. From one side all forms of creatures are developed; some kind of physical evolution from the animal to the human body is admitted in the Aitareya. The Taittiriya suggests the psychological progress of man, and the psychological progress of race cannot be different in principle from the evolution of the individual—a proceeding from the material, the emotionally and mentally inert man upwards [through] the mental to [our] spiritual fulfilment. The Puranas admit the creation of animal forms before the appearance of man and in the symbol of the Ten Avatars trace the growth of our evolution from the fish through the animal, the man-animal and the developed human being to the different stages of our present incomplete evolution. But the ancient Hindu, it is clear, envisaged this progression as an enormous secular movement covering more ages than we can easily count. He believed that Nature has repeated it over & over again, as indeed it is probable that she has done, resuming briefly & in sum at each start what she had previously accomplished in detail, slowly & with labour. It is this great secular movement in cycles, perpetually self-repeating, yet perpetually progressing, which is imaged and set forth for us in the symbols of the Puranas. It is for this reason that he assigned to his civilisation those immense eras and those ancient and far backward beginnings which strike the modern as so incredible. He may have erred; recent discoveries & indications are increasingly tending to convince us that nineteenth century scholarship has erred equally in the opposite direction.

Translated again into modern language the Hindu idea of the chaturyuga, four Ages, with all the attendant Puranic
circumstances persists as the tradition of a period just such as has been postulated, a period of natural and perfect poise in his knowledge, action and temper between man and his environment. The ideas, the knowledge, the temper, the spirit of this great epoch of civilisation, — but not its institutions or practices — is preserved for us in the Veda and Vedanta, and all existing human societies, civilised or barbarous, go back for the origins of their thought, character & effort to the general type of humanity that was then formed.
Section Two

The East and the West
A Misunderstanding of Continents

The peculiar and striking opposition of thought, temperament, culture and manners between Asia and Europe has been a commonplace of observation and criticism since the times when Herodotus noted in his history the objection of both men and women to be seen naked as a curious and amusing trait of Asiatic barbarism. Much water has flown under the bridges since Herodotus wrote and in this respect Asia seems not only to have infected Europe with this “barbaric” trait of manners, but to have been far outstripped by her pupil in the development of sartorial superfluities. Excessive wealth and gorgeous splendour was also quoted as a characteristic of Asiatic barbarism from the time of the classical poets. Europe has seen to it that this charge shall only apply now in a very minimum quantity to the eastern continent. Asia now stands, not only by choice of her ascetics, but by economic compulsion for the simple life, and the ostentation of wealth which was once depreciated as a sign of oriental barbarism now parades itself, much vulgarised, at least to our barbaric eastern notion of aesthetics as the splendid face of occidental civilisation. But if circumstances have changed, the essential opposition abides; East is still East in its soul and West is still West and the misunderstanding of continents still flourishes, not only in the minds of politicians and “statesmen”, — where one would naturally expect to find it, since it is there that vulgar prejudices, half-truths, whole untruths and unintelligent commonplaces assume their most solemn and sententious form, coin themselves into glittering phrases or flow in rhetorical periods, — but in the minds too of critics, poets and leading intellectuals. Faced with this continued misunderstanding, one is obliged to ask whether it is really incurable, an antinomy on which Nature is resolved to insist until the end of this cycle.

Some of us, temerarious idealists, have thought that the
misconception, the want of understanding is not only curable, but that to cure it as soon as may be is essential to the future interests of humanity. For my part I hold that all antinomies and opposed powers in this world of contradictions would be much better for an attempt to understand each other’s souls and find their meeting point, would find something helpful not only to tone down their own exaggerations, but to fill in and round themselves without losing what is essential to their own spirit. Recently there has been a distinct widening in many minds, a nearer approach to understanding, almost to fusion. A little while ago in the first lyrical enthusiasm of the war and its “sacred unions” one imagined that a decisive step had been taken and the peoples themselves would now be ready for sympathy and understanding. But it seems it is not quite so yet[.]
Towards Unification

The progress of distance-bridging inventions, our modern facility for the multiplication of books and their copies and the increase of human curiosity are rapidly converting humanity into a single intellectual unit with a common fund of knowledge and ideas and a unified culture. The process is far from complete, but the broad lines of the plan laid down by the great Artificer of things already begin to appear. For a time this unification was applied to Europe only. Asia had its own triune civilisation, predominatingly spiritual, complex and meditative in India, predominatingly vital, emotional, active and simplistic in the regions of the Hindu Kush and Mesopotamia, predominatingly intellectual, mechanical and organised in the Mongolian empires. East, West and South had their widely separate spirit and traditions, but one basis of spirituality, common tendencies and such commerce of art, ideas and information as the difficulties of communication allowed, preserved the fundamental unity of Asia. East & West only met at their portals, in war oftener than in peace and through that shock and contact influenced but did not mingle with each other. It was the discovery of Indian philosophy and poetry which broke down the barrier. For the first time Europe discovered something in the East which she could study not only with the curiosity which she gave to Semitic and Mongolian ideas and origins, but with sympathy and even with some feeling of identity. This metaphysics, these epics and dramas, this formulated jurisprudence and complex society had methods and a form which, in spite of their diversity from her own, yet presented strong points of contact; she could recognise them, to a certain extent she thought she could understand. The speculativeness of the German, the lucidity of the Gaul, the imagination and aesthetic emotionalism of the British Celt found something to interest them, something even to assist. In
the teachings of Buddha, the speculation of Shankara, the poetry of Kalidasa their souls could find pasture and refreshment. The alien form and spirit of Japanese and Arabian poetry and of Chinese philosophy which prevented such an approximation with the rest of Asia, was not here to interfere with the comprehension of the human soul & substance. There was indeed a single exception which remarkably illustrates the difficulty of which I speak. The art of India contradicted European notions too vitally to be admitted into the European consciousness; its charm and power were concealed by the uncouthness to Western eyes of its form and the strangeness of its motives and it is only now, after the greatest of living art-critics in England had published sympathetic appreciations of Indian art and energetic propagandists like Mr. Havell had persevered in their labour, that the European vision is opening to the secret of Indian painting & sculpture. But the art of Japan presented certain outward characteristics on which the European could readily seize. Japanese painting had already begun to make its way into Europe even before the victories of Japan and its acceptance of much of the outward circumstances of European civilisation opened a broad door into Europe for all in Japan that Europe can receive without unease or the feeling of an incompatible strangeness. Japanese painting, Japanese dress, Japanese decoration are not only accepted as a part of Western life by the select few and the cultured classes but known and allowed, without being adopted, by the millions. Asiatic civilisation has entered into Europe as definitely though not so victoriously as European civilisation into Asia. It is only the beginning, but so was it only the beginning when a few scholars alone rejoiced in the clarity of Buddhistic Nihilism, Schopenhauer rested his soul on the Upanishads and Emerson steeped himself in the Gita. No one could have imagined then that a Hindu monk would make converts in London and Chicago or that a Vedantic temple would be built in San Francisco and Anglo-Saxon Islamites erect a Musulman mosque in Liverpool. It appears from a recent inquiry that the only reading, omitting works of fiction, which commands wide and general interest
among public library readers is either scientific works or books replete with Asiatic mysticism. How significant is this fact when we remember that these are the two powers, Europe & Asia, the victorious intellect and the insurgent spirit, which are rising at this moment to do battle for the mastery of the unified world. Nevertheless it is not the public library reader, that man in the street of the literary world, but the increasing circle of men of culture and a various curiosity through whom the Orient & the Occident must first meet in a common humanity and the day dawn when some knowledge of the substance of [the] Upanishads will be as necessary to an universal culture as a knowledge of the substance of the Bible, Shankara’s theories as familiar as the speculations of Teutonic thinkers and Kalidasa, Valmekie & Vyasa as near and common to the subject matter of the European critical intellect as Dante or Homer.

It is the difficulties of presentation that prevent a more rapid and complete commingling.
China, Japan and India

It is significant of the tendencies of the twentieth century that all its great and typical events should have occurred no longer as in the last few centuries in Europe, but in Asia. The Russo-Japanese war, the Chinese Revolution, the constitutional changes in Turkey & Persia and last but most momentous the revival however indeterminate as yet of the soul of India, are the really significant events of the young century. In Europe except in its one Asiatic corner there has been no event of corresponding magnitude & importance. The abortive orgy of revolutionary fury in Russia, the growth of enormous strikes, the failure of the peace movement, the increase of legislation stamped with the pressure of a materialistic Socialism, although they may hold in themselves germs of greater things, are so far mere indistinct material symptoms of disorganisation & a disease vainly doctored with palliatives, not events of a definite movement of new birth & regeneration. The importance of this new tendency lies in the fact that great events in Europe, even when they are outwardly spiritual, have usually an intellectual or social trend & significance, but great events in Asia have even when they are outwardly intellectual, social or political a spiritual significance. Therefore when Asia once more becomes the theatre of the world's chief events, it is a sure sign that some great spiritual revolution, perhaps a great age of spirituality is preparing for humanity.
Section Three

India
Renascent India

Everybody can feel, even without any need of a special sense for the hidden forces and tendencies concealed in the apparent march of things, for the signs are already apparent, that India is on the verge, in some directions already in the first movements of a great renascence, more momentous, more instinct with great changes and results, than anything that has gone before it. Every new awakening of the kind comes by some impact slight or great on the national consciousness which puts it in face of new ideas, new conditions, new needs, the necessity of readaptation to a changing environment. The spirit of the nation has to take account of its powers and possibilities and is stirred by a will to new formation and new creation. The change does not always amount to a renascence. But the impact in which we live at the present hour is nothing less than that of a new world. It is not merely the pressure of the whole Western civilisation upon the ancient spirit of the East or of modernism on a great traditional civilisation, but it is a great worldwide change, an approaching new birth of mankind itself of which the change in us is only a part. Therefore the result that we are face to face with, is a renascence, the birth of the Spirit into a new body, new forms in society and politics, new forms of literature, art, science, philosophy, action and creation of all kinds. And the question arises what in the great play of modification and interchange around us are we going to take from the world around us, how are we going to shape [it] in the stress of our own spirit and past traditions, and what are we going to bring out of ourselves and impress upon the world in exchange? In what new forms is the spirit of India going to embody itself and what relations will its new creations have with the future of the world?
Where We Stand in Literature

[Draft A]

Where we stand, not only in literature, but in all things, is at or near a great turning point in which the thoughts and forms of East and West, both in an immense ferment of change, are working upon each other to produce something great, unforeseeable and unprecedented. From the less worldwide viewpoint which most nearly concerns us in this country, we may say, that we find ourselves in a great hour of rebirth of the ancient soul of India. The momentous issues of this hour are producing their inevitable upheaval, change and effort at creation in the whole national life, politics, society, economical conditions, industry, commerce, as well as and more noisily than in literature. But it is perhaps in art, literature and science that the future will see what was most definitive in the creations of the present hour, the most significant thing in the Indian renascence; for these things reveal most freely the spirit which is coming to birth; they have found their field, discovered their motive; the rest is still only a primary effort to escape out of unnatural conditions; the field has there yet to be made clear, before the struggling spiritual motive can make itself dominant and create its appropriate forms. Especially, is the movement of literature most revelatory; for while music and art reveal perhaps more absolutely the soul of a nation, literature is the whole expression of its mind and psychology, — not only of what it is in action, or what it is in essence, but its thought, character and aspiration.

[Draft B]

In literature, as in all else, we stand in India at the opening of a new age, in an hour of national rebirth and in the midst of a number of tendencies, possibilities, movements of which only a
few have as yet formed for themselves distinct shapes, plainly decipherable signs. It is an hour not yet of accomplishment, but of travail and inception. What will be born of this dim travail, these shapeless or half-shaped beginnings, is no doubt already decided in the secret spirit of the age and in the subconscient mind of the people. Behind the waverings and strivings of our twilit surface minds the soul of India knows no doubt what it intends and is moving us to great fulfilments. But it is well also for us to ponder and inquire what it is the national soul and the soul of humanity demand from us and on what paths we are most likely to give our energies and efforts the maximum power and serviceableness to the great age of mankind and of India on which we are entering. For at such a moment there are usually many false starts and many misdirected aims and by seeing our way and our goal more clearly we may better be able to avoid the waste of energy, talent and even genius to which they give rise.
Section Four

Genius, Poetry, Beauty
The Origin of Genius

When the human being puts forth a force in himself which is considerable but acts normally, we call it talent; when it is abnormal in its working we call it genius. It would seem, therefore, that genius is in reality some imperfect step in evolution by which mankind in its most vigorous and forward individuals is attempting to develop a faculty which the race as a whole is not strong enough as yet to command or to acclimatise. As always happens in such a movement, there is a considerable irregularity in the working of the new phenomenon. Sometimes Nature seems to prepare by heredity for these its new experiments & fine flowers of humanity[.]
Poetic Genius

The greatest poets are usually those who arise either out of a large simple and puissant environment or out of a movement of mind that is grandiose, forceful & elemental. When man becomes excessively refined in intellect, curious in aesthetic sensibility or minute & exact in intellectual reasoning, it becomes more & more difficult to write great and powerful poetry. Ages of accomplished intellectuality & scholarship or of strong scientific rationality are not favourable to the birth of great poets or, if they are born, not favourable to the free & untrammeled action of their gifts. They remain great, but their greatness bends under a load; there is a lack of triumphant spontaneity and they do not draw as freely or directly from the sources of human action & character. An untameable elemental force is needed to overcome more than partially the denials of the environment. For poetry, even though it appeals in passing to the intellect & aesthetic sense, does not proceed from them but is in its nature an elemental power proceeding from the secret & elemental Power within which sees directly & creates sovereignly, & it passes at once to our vital & elemental parts. Intellect and the aesthetic faculties are necessary to the perfection of our critical enjoyment; but they were only assistants, not the direct agents of this divine birth.
The Voices of the Poets

Out of the infinite silence of the past, peopled only to the eye of history or the ear of the Yogin, a few voices arise which speak for it, express it and are the very utterance and soul of those unknown generations, of that vanished and now silent humanity. These are the voices of the poets. We whose souls are drying up in this hard and parched age of utilitarian and scientific thought when men value little beyond what gives them exact and useful knowledge or leads them to some outward increase of power & pleasure, we who are beginning to neglect & ignore poetry and can no longer write it greatly & well, — just as we have forgotten how to sculpture like the Greeks, paint like the mediaeval Italians or build like the Buddhists, — are apt to forget this grand utility of the poets, one noble faculty among their many divine and unusual powers. The kavi or vates, poet & seer, is not the manishi; he is not [the] logical thinker, scientific analyser or metaphysical reasoner; his knowledge is one not with his thought, but with his being; he has not arrived at it but has it in himself by virtue of his power to become one with all that is around him. By some form of spiritual, vital and emotional oneness, he is what he sees; he is the hero thuddering in the forefront of the battle, the mother weeping over her dead, the tree trembling violently in the storm, the flower warmly penetrated with the sunshine. And because he is these things, therefore he knows them; because he knows thus, spiritually & not rationally, he can write of them. He feels their delight & pain, he shares their virtue & sin, he enjoys their reward or bears their punishment. It is for this reason that poetry written out of the intellect is so inferior to poetry written out of the soul, is, — even as poetical thinking, — so inferior to the thought that comes formed by inscrutable means out of the soul. For this reason, too, poets of otherwise great faculty, have failed to give us living
men and women or really to show to our inner vision even the things of which they write eloquently or sweetly, because they are content to write about them after having seen them with the mind only, and have not been able or have not taken care first to be the things of which they would write and then not so much write about them as let them pour themselves out in speech that is an image of the soul. They have been too easily attracted by the materials of poetry, artha & shabda; drawn by some power & charm in the substance of speech, captivated by some melody, harmony or colour in the form of speech, arrested by some strong personal emotion which clutches at expression or gropes for expression in these externals of poetry they have forgotten to bathe in the Muse’s deepest springs.

Therefore among those ancient voices, even when the literature of the ages has been winnowed & chosen by Time, there are very few who recreate for us in poetic speech deeply & mightily the dead past, because they were that past, not so much themselves as the age & nation in which they lived and not so much even the age and nation as that universal humanity which in spite of all differences, under them and within them, even expressing its unity through them is the same in every nation and in every age. Others give us only fragments of thought or outbursts of feeling or reveal to us scattered incidents of sight, sound and outward happening. These are complete, vast, multitudinous, infinite in a way, impersonal & many-personed in their very personality, not divine workmen merely but true creators endowed by God with something of His divine power and offering therefore in their works some image of His creative activity.
Pensées

God has a personality but no character; He is as we say in our Eastern thought, Anantaguna, of an infinite variation of qualities without fixed limitation or rigid distinction and incompatibility. His superhuman cruelty melts into and harmonises with His ineffable pity; His fierce enmity is one mask of His intensest love. For, being alone existent, He is irresponsible and the harmonies He creates, are the figment of His own plastic will and governed by laws of aesthetics determined in His own unfettered but infallible fantasy. Out of His infinite personality He creates all these characters & their inevitable actions & destinies. So it is with every divine creator, — with Homer, Shakespeare, Valmiki, Kalidasa. It is perfectly true that each has his own style of language & creation, his own preferred system or harmony of the poetic Art, just as the creator of this universe has fashioned it in a particular style & rhythm & on certain preferred & fixed canons, differing from that of the other universes He may have built in His infinite Being. But within that style & harmony they are not bound by any fixed personality. It is rather the infinite they express though through their personality, than their personality through their works. The writers who are limited by their personality may be among the fine artists of literature; they cannot be among the greatest creators; for to the creator freedom & infinity are necessary attributes. It is the infinite alone that can create; the finite can only manufacture, reproduce or at the most bring out a fine art & craftsmanship. Among all the Elizabethan dramatists Shakespeare alone has produced living men; the rest are only admirable, trivial or monstrous sketches, caricatures or images of men. There is, however, one exception to this rule; every man can at his best moments cast out, create in some way or another — for in our Indian languages the word for creating is casting out, letting free out of one’s own being — one living

www.holybooks.com
creature & character,—himself. Milton has produced several bold & beautiful or fine outlines or descriptions, but only one living being, the rebel Archangel Satan, and only so in the first four books of Paradise Lost does Satan really live. When Milton ceases to portray himself in his fallen state and thinks only of his plot & subject, Satan also ceases to live. But the great impersonal creators even in their slightest creations, cannot help creating life. Impersonal, I say, but I do not mean by impersonality the nirguna, devoid or pure of quality, but rather the unfixed & unlimited by quality, — an infinite & indefinable personality out of which is not manufactured or cunningly shaped but perfectly & inevitably arises under the compelling eye of an intuitive Will to be this created world of innumerable brilliantly-coloured variously outlined individual existences.
A Dream

This is the story of a dream that often came & always fled, a dream that continued by snatches and glimpses through a succession of nights, at intervals of weeks, the mind returning again and again to the unfinished vision, the imagination and intuition filling in the gaps & interstices of a half told tale. Visions of waters blue in an immortal sunlight or grey in the drifting of a magic welter of cloud & rain, rocks swept by the surf and whistling in their hollows with the wind, island meadows & glades many pictured above the sea, rivers and haze-purpled hills, a scene of unimaginable beauty where forms moved that had not lost the pristine beauty of man before the clutch stiffened on him of early decay & death, of grief and old age, where hearts beat that had not lost the pulsations of our ancient immortality and were not yet attuned to the broken rhythms of pain & grief. The impression of such an atmosphere & background remains which the linking of ineffective details & the effort of words which are laden with the thoughts of an afflicted and oppressed humanity, strive vainly to restore. For those colours we have lost. When we speak of brightness, it is a subdued brilliance that is the utmost our imaginations can conceive; we mean only a broken hint of rapture when we talk even most eagerly of enjoyment & bliss.
The Beauty of a Crow’s Wings

It is not only that the sable blackness of the crow’s wings has in it wonderful shades of green and violet and purple which show themselves under certain stresses of sunlight, but that the black itself, sable of wing or dingy of back & breast has itself a beauty which our prejudiced habits of mind obscure to us. Under its darkness, we see, too, a glint of dingy white.
Section Five

Science, Religion, Reason, Justice
Science

We live under the reign of Science, a reign which from the mouth of its hierophants claims to be a tyranny or at least an absolute monarchy. It makes this claim by right of the great things it has done, of the immense utilities with which it has served, helped, strengthened, liberated, mankind, right knowledge of the world, an increasing and already fabulous mastery of Nature, a clear and free intellectual vision of things and masterful dealing with them, liberation from the fetters of ignorance, from blind subjection to authority, from unquestioning political, social, religious and cultural tradition with all their hindrance and their evil.
Religion

In a word, the religious tendency, the religious spirit in man does not escape from the law of evolution that governs the other parts of his complex psychological nature. Even though its very reason of existence is the inner sense of a soul and spirit within and around us and the search for spiritual truth and experience, that must be in their very nature a suprarational truth and experience, it begins like the rest with an infrarational instinct, an infrarational formulation, falls under the influence of the reasoning mind and only at its [sentence not completed]
A pragmatic mentalism would not be in its essential principle other than the attempt already made by the race to make the intellectual Reason the governor of life, but this has been done hitherto by a reason preoccupied with the external fact and subjected to it; mind has attempted to read the law of life and its possibilities and organise life anew within those limits by invention, device, regulation, mechanisms of many kinds, or it has attempted to govern life by mental ideals of an abstract order, such as democracy or socialism, and devise an appropriate machinery materialising that mental abstraction so as to make the dominance of the idea practical and viable. A subjectivist pragmatic mentalism would try to act more subtly and plastically on life; it would seek for “truth of being”, some idea or ideal of its perfection or practice or efficiency, right way of being or living, and attempt to let that grow in the individual and govern his nature, grow in the collective life and govern its formations. Or it would place the development and organisation of the mental life of man as the primary consideration and life and society as a convenience for this true aim of human existence. A new civilisation no longer vitalistic or mainly political and economic, but intellectual, cultural, idealistic, taking up the ancient ideal of man, the perfected mental being in an ennobled life and sound body, a great expansion of human mind and intellect, a mankind more mentally alive, even a human race grown capable of culture and not only of a greater external civilisation, thus fulfilling on a large human and universal scale the tendencies which in the past appeared only in a few favoured countries and epochs and even then imperfectly and mostly in a cultured class, might be the consequence of this change. That prospect has its attractions, and for the humanist and the intellectual it is in one form or another their utopia of the future. But this would not really
carry the human evolution farther; it would only give it for a time a larger, finer and freer movement in its widest attainable circle. If the mentality remained too pragmatic, too eager to rationalise or organise life according to the idea, the peril of mechanisation and standardisation would be there. If the mental ideas governing the individual and social life took a settled form, became a cultural system of the mind, this system would after a time exhaust its possibilities and human life would settle down into a groove, satisfied and non-evolutive, as happened in the Graeco-Roman world or in China or elsewhere where the mental intellect became the predominant power of life. If this arrest were avoided either by the multiplication of different cultures — different peoples acting upon each other but escaping the tendency to replication and standardisation which is the tendency of the human collective mind or by a free progressiveness of the human intelligence making constantly new ideas, new ideals, still the movement would eventually be in a circle or an ellipsis which could be a constant description of a new-old movement in the same field. In fact our external mind moving on the surface tends always to exhaust itself rapidly; if it expends itself slowly, conservatively, at a leisurely pace, it can create a civilisation and culture which will last for centuries or even for one or more thousands of years; but that too will exhaust itself in time; if it throws itself into a brilliant or rapid movement as in ancient Greece or in modern Europe a few centuries are likely to see the end of this flaming up as of a new star. Afterwards there must be stagnation, decline and a renewal of the mental circle.

This is because mind and thought are not the sovereign principle or highest term of our existence; mind and thought therefore can to a certain extent fulfil themselves, but they cannot fulfil life nor can they give to man his complete self. Mind is an instrument, not the self of man; nor the complete reality or highest reality of his being. It is a mediator between the being and life; it seeks to know truth of being and truth of life and bring them together. Truth of idea therefore is effective only so far as it can interpret truth of spirit and truth of life, it has itself no essential existence; when it erects itself as a mental
abstraction, it has no reality and no effective power; it is only an index, a figure. It can become effective only by taking up life and catching hold of some vital force to effectuate it, but usually it ends by [. . . ], exhausting or stereotyping and sterilising the force it uses; or it can become effective only when it canalises and brings out into action of mind and life an inner truth of being, a truth of spirit and it is then powerful only so long as it replenishes itself from its spiritual source and so keeps itself true and alive.
Justice

Justice, one says; but what is Justice? Plato’s question applies to this as to every other sacred icon set up by men for their worship.

Justice for each man is what his own type of mind accepts as right and proper and equitable as between men and men. Or, it might be added, between the community and its constituents, the State and its citizens.
Part Four

Thoughts and Aphorisms

Sri Aurobindo wrote the main series of 540 aphorisms around 1913 in a single notebook under the headings “Jnana”, “Karma” and “Bhakti”. Seven additional aphorisms were not classified under these headings; the last five were written in a different notebook, probably somewhat later.
Jnana
Jnana

1. There are two allied powers in man; knowledge & wisdom. Knowledge is so much of the truth seen in a distorted medium as the mind arrives at by groping, wisdom what the eye of divine vision sees in the spirit.

2. Inspiration is a slender river of brightness leaping from a vast & eternal knowledge, it exceeds reason more perfectly than reason exceeds the knowledge of the senses.

3. When I speak, the reason says, “This will I say”; but God takes the word out of my mouth and the lips say something else at which reason trembles.

4. I am not a Jnani, for I have no knowledge except what God gives me for His work. How am I to know whether what I see be reason or folly? Nay, it is neither; for the thing seen is simply true & neither folly nor reason.

5. If mankind could but see though in a glimpse of fleeting experience what infinite enjoyments, what perfect forces, what luminous reaches of spontaneous knowledge, what wide calms of our being lie waiting for us in the tracts which our animal evolution has not yet conquered, they would leave all & never rest till they had gained these treasures. But the way is narrow, the doors are hard to force, and fear, distrust & scepticism are there, sentinels of Nature, to forbid the turning away of our feet from her ordinary pastures.

6. Late, I learned that when reason died, then Wisdom was born; before that liberation, I had only knowledge.
7. What men call knowledge, is the reasoned acceptance of false appearances. Wisdom looks behind the veil and sees.

8. Reason divides, fixes details & contrasts them; Wisdom unifies, marries contrasts in a single harmony.

9. Either do not give the name of knowledge to your beliefs only and of error, ignorance or charlatanism to the beliefs of others, or do not rail at the dogmas of the sects and their intolerance.

10. What the soul sees and has experienced, that it knows; the rest is appearance, prejudice and opinion.

11. My soul knows that it is immortal. But you take a dead body to pieces and cry triumphantly “Where is your soul and where is your immortality?”

12. Immortality is not the survival of the mental personality after death, though that also is true, but the waking possession of the unborn & deathless self of which body is only an instrument and a shadow.

13. They proved to me by convincing reasons that God did not exist, and I believed them. Afterwards I saw God, for He came and embraced me. And now which am I to believe, the reasonings of others or my own experience?

14. They told me, “These things are hallucinations.” I inquired what was a hallucination and found that it meant a subjective or a psychical experience which corresponds to no objective or no physical reality. Then I sat and wondered at the miracles of the human reason.

15. Hallucination is the term of Science for those irregular glimpses we still have of truths shut out from us by our pre-occupation with matter; coincidence for the curious touches of
artistry in the work of that supreme & universal Intelligence which in its conscious being as on a canvas has planned & executed the world.

16. That which men term a hallucination is the reflection in the mind & senses of that which is beyond our ordinary mental & sensory perceptions. Superstition arises from the mind’s wrong understanding of these reflections. There is no other hallucination.

17. Do not, like so many modern disputants, smother thought under polysyllables or charm inquiry to sleep by the spell of formulas and cant words. Search always; find out the reason for things which seem to the hasty glance to be mere chance or illusion.

18. Someone was laying it down that God must be this or that or He would not be God. But it seemed to me that I can only know what God is and I do not see how I can tell Him what He ought to be. For what is the standard by which we can judge Him? These judgments are the follies of our egoism.

19. Chance is not in this universe; the idea of illusion is itself an illusion. There was never illusion yet in the human mind that was not the concealing [shape] and disfigurement of a truth.

20. When I had the dividing reason, I shrank from many things; after I had lost it in sight, I hunted through the world for the ugly and the repellent, but I could no longer find them.

21. God had opened my eyes; for I saw the nobility of the vulgar, the attractiveness of the repellent, the perfection of the maimed and the beauty of the hideous.

22. Forgiveness is praised by the Christian and the Vaishnava, but for me, I ask, “What have I to forgive and whom?”
23. God struck me with a human hand; shall I say then, “I pardon Thee thy insolence, O God”?

24. God gave me good in a blow. Shall I say, “I forgive thee, O Almighty One, the harm and the cruelty, but do it not again”?

25. When I pine at misfortune and call it evil, or am jealous and disappointed, then I know that there is awake in me again the eternal fool.

26. When I see others suffer, I feel that I am unfortunate, but the wisdom that is not mine, sees the good that is coming and approves.

27. Sir Philip Sidney said of the criminal led out to be hanged, “There, but for the grace of God, goes Sir Philip Sidney.” Wiser, had he said, “There, by the grace of God, goes Sir Philip Sidney.”

28. God is a great & cruel Torturer because He loves. You do not understand this, because you have not seen & played with Krishna.

29. One called Napoleon a tyrant and imperial cut-throat; but I saw God armed striding through Europe.

30. I have forgotten what vice is and what virtue; I can only see God, His play in the world and His will in humanity.

31. I saw a child wallowing in the dirt and the same child cleaned by his mother and resplendent, but each time I trembled before his utter purity.

32. What I wished or thought to be the right thing, does not come about; therefore it is clear that there is no All Wise one who guides the world but only blind Chance or a brute Causality.

33. The Atheist is God playing at hide & seek with Himself;
but is the Theist any other? Well, perhaps; for he has seen the shadow of God and clutched at it.

34. O Thou that lovest, strike! If Thou strike me not now, I shall know that Thou lov’st me not.

35. O Misfortune, blessed be thou; for through thee I have seen the face of my Lover.

36. Men are still in love with grief; when they see one who is too high for grief or joy, they curse him & cry, “O thou insensible!” Therefore Christ still hangs on the cross in Jerusalem.

37. Men are in love with sin; when they see one who is too high for vice or virtue, they curse him & cry, “O thou breaker of bonds, thou wicked and immoral one!” Therefore Srikrishna does not live as yet in Brindavun.

38. Some say Krishna never lived, he is a myth. They mean on earth; for if Brindavun existed nowhere, the Bhagwat could not have been written.

39. Strange! the Germans have disproved the existence of Christ; yet his crucifixion remains still a greater historic fact than the death of Caesar.

40. Sometimes one is led to think that only those things really matter which have never happened; for beside them most historic achievements seem almost pale and ineffective.

41. There are four very great events in history, the siege of Troy, the life and crucifixion of Christ, the exile of Krishna in Brindavun and the colloquy with Arjuna on the field of Kurukshetra. The siege of Troy created Hellas, the exile in Brindavun created devotional religion, (for before there was only meditation and worship,) Christ from his cross humanised Europe, the colloquy at Kurukshetra will yet liberate humanity. Yet it is said that none of these four events ever happened.
They say that the Gospels are forgeries and Krishna a creation of the poets. Thank God then for the forgeries and bow down before the creators.

If God assigns to me my place in Hell, I do not know why I should aspire to Heaven. He knows best what is for my welfare.

If God draw me towards Heaven, then, even if His other hand strive to keep me in Hell, yet must I struggle upward.

Only those thoughts are true the opposite of which is also true in its own time and application; indisputable dogmas are the most dangerous kind of falsehoods.

Logic is the worst enemy of Truth, as self-righteousness is the worst enemy of virtue,—for the one cannot see its own errors nor the other its own imperfections.

When I was asleep in the Ignorance, I came to a place of meditation full of holy men and I found their company wearisome and the place a prison; when I awoke, God took me to a prison and turned it into a place of meditation and His trysting-ground.

When I read a wearisome book through and with pleasure, yet perceived all the perfection of its wearisomeness, then I knew that my mind was conquered.

I knew my mind to be conquered when it admired the beauty of the hideous, yet felt perfectly why other men shrank back or hated.

To feel & love the God of beauty and good in the ugly and the evil, and still yearn in utter love to heal it of its ugliness and its evil, this is real virtue and morality.

To hate the sinner is the worst sin, for it is hating God; yet he who commits it, glories in his superior virtue.
52. When I hear of a righteous wrath, I wonder at man’s capacity for self-deception.

53. This is a miracle that men can love God, yet fail to love humanity. With whom are they in love then?

54. The quarrels of religious sects are like the disputing of pots, which shall be alone allowed to hold the immortalising nectar. Let them dispute, but the thing for us is to get at the nectar in whatever pot and attain immortality.

55. You say that the flavour of the pot alters the liquor. That is taste; but what can deprive it of its immortalising faculty?

56. Be wide in me, O Varuna; be mighty in me, O Indra; O Sun, be very bright and luminous; O Moon, be full of charm and sweetness. Be fierce and terrible, O Rudra; be impetuous and swift, O Maruts; be strong and bold, O Aryama; be voluptuous and pleasurable, O Bhaga; be tender and kind and loving and passionate, O Mitra. Be bright and revealing, O Dawn; O Night, be solemn and pregnant. O Life, be full, ready & buoyant; O Death, lead my steps from mansion to mansion. Harmonise all these, O Brahmanaspati. Let me not be subject to these gods, O Kali.

57. When, O eager disputant, thou hast prevailed in a debate, then art thou greatly to be pitied; for thou hast lost a chance of widening knowledge.

58. Because the tiger acts according to his nature and knows not anything else, therefore he is divine and there is no evil in him. If he questioned himself, then he would be a criminal.

59. The animal, before he is corrupted, has not yet eaten of the tree of the knowledge of good and evil; the god has abandoned it for the tree of eternal life; man stands between the upper heaven and the lower nature.
60. One of the greatest comforts of religion is that you can get hold of God sometimes and give him a satisfactory beating. People mock at the folly of savages who beat their gods when their prayers are not answered; but it is the mockers who are the fools and the savages.

61. There is no mortality. It is only the Immortal who can die; the mortal could neither be born nor perish. There is nothing finite. It is only the Infinite who can make for Himself limits; the finite can have no beginning nor end, for the very act of conceiving its beginning & end declares its infinity.

62. I heard a fool discoursing utter folly and wondered what God meant by it; then I considered and saw a distorted mask of truth and wisdom.

63. God is great, says the Mahomedan. Yes, He is so great that He can afford to be weak, whenever that too is necessary.

64. God often fails in His workings; it is the sign of His illimitable godhead.

65. Because God is invincibly great, He can afford to be weak; because He is immutably pure, He can indulge with impunity in sin; He knows eternally all delight, therefore He tastes also the delight of pain; He is inalienably wise, therefore He has not debarred Himself from folly.

66. Sin is that which was once in its place, persisting now it is out of place; there is no other sinfulness.

67. There is no sin in man, but a great deal of disease, ignorance and misapplication.

68. The sense of sin was necessary in order that man might become disgusted with his own imperfections. It was God's corrective for egoism. But man's egoism meets God's device by being
very duly alive to its own sins and very keenly alive to the sins of others.

69. Sin & virtue are a game of resistance we play with God in His efforts to draw us towards perfection. The sense of virtue helps us to cherish our sins in secret.

70. Examine thyself without pity, then thou wilt be more charitable and pitiful to others.

71. A thought is an arrow shot at the truth; it can hit a point, but not cover the whole target. But the archer is too well satisfied with his success to ask anything farther.

72. The sign of dawning Knowledge is to feel that as yet I know little or nothing, & yet, if I could only know my knowledge, I already possess everything.

73. When Wisdom comes, her first lesson is, “There is no such thing as knowledge; there are only aperçus of the Infinite Deity.”

74. Practical knowledge is a different thing; that is real and serviceable, but it is never complete. Therefore to systematise and codify it is necessary but fatal.

75. Systematise we must, but even in making & holding the system, we should always keep firm hold on this truth that all systems are in their nature transitory and incomplete.

76. Europe prides herself on her practical and scientific organisation and efficiency. I am waiting till her organisation is perfect; then a child shall destroy her.

77. Genius discovers a system; average talent stereotypes it till it is shattered by fresh genius. It is dangerous for an army to be led by veterans; for on the other side God may place Napoleon.
432  Essays Divine and Human

78. When knowledge is fresh in us, then it is invincible; when it is old, it loses its virtue. This is because God moves always forward.

79. God is infinite Possibility. Therefore Truth is never at rest; therefore, also, Error is justified of her children.

80. To listen to some devout people, one would imagine that God never laughs; Heine was nearer the mark when he found in Him the divine Aristophanes.

81. God's laughter is sometimes very coarse and unfit for polite ears; He is not satisfied with being Molière, He must needs also be Aristophanes and Rabelais.

82. If men took life less seriously, they could very soon make it more perfect. God never takes His works seriously; therefore one looks out on this wonderful Universe.

83. Shame has admirable results and both in aesthetics and in morality we could ill spare it; but for all that it is a badge of weakness and the proof of ignorance.

84. The supernatural is that the nature of which we have not attained or do not yet know, or the means of which we have not yet conquered. The common taste for miracles is the sign that man's ascent is not yet finished.

85. It is rationality and prudence to distrust the supernatural; but to believe in it, is also a sort of wisdom.

86. Great saints have performed miracles; greater saints have railed at them; the greatest have both railed at them and performed them.

87. Open thy eyes and see what the world really is and what God; have done with vain and pleasant imaginations.
88. This world was built by Death that he might live. Wilt thou abolish death? Then life too will perish. Thou canst not abolish death, but thou mayst transform it into a greater living.

89. This world was built by Cruelty that she might love. Wilt thou abolish cruelty? Then love too will perish. Thou canst not abolish cruelty, but thou mayst transfigure it into its opposite, into a fierce Love & Delightfulness.

90. This world was built by Ignorance & Error that they might know. Wilt thou abolish ignorance and error? Then knowledge too will perish. Thou canst not abolish ignorance & error, but thou mayst transmute them into the utter & effulgent exceeding of reason.

91. If Life alone were & not death, there could be no immortality; if love were alone & not cruelty, joy would be only a tepid & ephemeral rapture; if reason were alone & not ignorance, our highest attainment would not exceed a limited rationality & worldly wisdom.

92. Death transformed becomes Life that is Immortality; Cruelty transfigured becomes Love that is intolerable ecstasy; Ignorance transmuted becomes Light that leaps beyond wisdom and knowledge.

93. Pain is the touch of our Mother teaching us how to bear and grow in rapture. She has three stages of her schooling, endurance first, next equality of soul, last ecstasy.

94. All renunciation is for a greater joy yet ungrasped. Some renounce for the joy of duty done, some for the joy of peace, some for the joy of God and some for the joy of self-torture, but renounce rather as a passage to the freedom and untroubled rapture beyond.

95. Only by perfect renunciation of desire or by perfect satisfaction of desire can the utter embrace of God be experienced;
for in both ways the essential precondition is effected,—desire perishes.

96. Experience in thy soul the truth of the Scripture; afterwards, if thou wilt, reason & state thy experience intellectually & even then distrust thy statement; but distrust never thy experience.

97. When thou affirmest thy soul-experience & deniest the different soul-experience of another, know that God is making a fool of thee. Dost thou not hear His self-delighted laughter behind thy soul’s curtains?

98. Revelation is the direct sight, the direct hearing or the inspired memory of Truth, drishti, sruti, smriti; it is the highest experience and always accessible to renewed experience. Not because God spoke it, but because the soul saw it, is the word of the Scriptures our supreme authority.

99. The word of Scripture is infallible; it is in the interpretation the heart and reason put upon the Scripture that error has her portion.

100. Shun all lowness, narrowness & shallowness in religious thought & experience. Be wider than the widest horizons, be loftier than the highest Kanchenjunga, be profounder than the deepest oceans.

101. In God’s sight there is no near or distant, no present, past or future. These things are only a convenient perspective for His world-picture.

102. To the senses it is always true that the sun moves round the earth; this is false to the reason. To the reason it is always true that the earth moves round the sun; this is false to the supreme vision. Neither earth moves nor sun; there is only a change in the relation of sun-consciousness & earth-consciousness.
103. Vivekananda, exalting Sannyasa, has said that in all Indian history there is only one Janaka. Not so, for Janaka is not the name of a single individual, but a dynasty of self-ruling kings and the triumph-cry of an ideal.

104. In all the lakhs of ochre-clad Sannyasins, how many are perfect? It is the few attainments and the many approximations that justify an ideal.

105. There have been hundreds of perfect Sannyasins, because Sannyasa had been widely preached and numerousiy practised; let it be the same with the ideal freedom and we shall have hundreds of Janakas.

106. Sannyasa has a formal garb and outer tokens; therefore men think they can easily recognise it; but the freedom of a Janaka does not proclaim itself and it wears the garb of the world; to its presence even Narada was blinded.

107. Hard is it to be in the world, free, yet living the life of ordinary men; but because it is hard, therefore it must be attempted and accomplished.

108. When he watched the actions of Janaka, even Narada the divine sage thought him a luxurious worldling and libertine. Unless thou canst see the soul, how shalt thou say that a man is free or bound?

109. All things seem hard to man that are above his attained level, & they are hard to his unaided effort; but they become at once easy & simple when God in man takes up the contract.

110. To see the composition of the sun or the lines of Mars is doubtless a great achievement; but when thou hast the instrument that can show thee a man’s soul as thou seest a picture, then thou wilt smile at the wonders of physical Science as the playthings of babies.
111. Knowledge is a child with its achievements; for when it has found out something, it runs about the streets whooping and shouting; Wisdom conceals hers for a long time in a thoughtful and mighty silence.

112. Science talks and behaves as if it had conquered all knowledge: Wisdom, as she walks, hears her solitary tread echoing on the margin of immeasurable Oceans.

113. Hatred is the sign of a secret attraction that is eager to flee from itself and furious to deny its own existence. That too is God’s play in His creature.

114. Selfishness is the only sin, meanness the only vice, hatred the only criminality. All else can easily be turned into good, but these are obstinate resisters of deity.

115. The world is a long recurring decimal with Brahman for its integer. The period seems to begin and end, but the fraction is eternal; it will never have an end and never had any real beginning.

116. The beginning and end of things is a conventional term of our experience; in their true existence these terms have no reality, there is no end and no beginning.

117. “Neither is it that I was not before nor thou nor these kings nor that all we shall not be hereafter.” Not only Brahman, but beings & things in Brahman are eternal; their creation and destruction is a play of hide and seek with our outward consciousness.

118. The love of solitude is a sign of the disposition towards knowledge; but knowledge itself is only achieved when we have a settled perception of solitude in the crowd, in the battle and in the mart.
119. If when thou art doing great actions and moving giant results, thou canst perceive that thou art doing nothing, then know that God has removed His seal from thy eyelids.

120. If when thou sittest alone, still & voiceless on the mountaintop, thou canst perceive the revolutions thou art conducting, then hast thou the divine vision and art freed from appearances.

121. The love of inaction is folly and the scorn of inaction is folly; there is no inaction. The stone lying inert upon the sands which is kicked away in an idle moment, has been producing its effect upon the hemispheres.

122. If thou wouldst not be the fool of Opinion, first see wherein thy thought is true, then study wherein its opposite and contradiction is true; last, discover the cause of these differences and the key of God’s harmony.

123. An opinion is neither true nor false, but only serviceable for life or unserviceable; for it is a creation of Time and with time it loses its effect and value. Rise thou above opinion and seek wisdom everlasting.

124. Use opinion for life, but let her not bind thy soul in her fetters.

125. Every law, however embracing or tyrannous, meets somewhere a contrary law by which its operation can be checked, modified, annulled or eluded.

126. The most binding Law of Nature is only a fixed process which the Lord of Nature has framed and uses constantly; the Spirit made it and the Spirit can exceed it, but we must first open the doors of our prison-house and learn to live less in Nature than in the Spirit.

127. Law is a process or a formula; but the soul is the user of processes and exceeds formulas.
128. Live according to Nature, runs the maxim of the West; but according to what nature, the nature of the body or the nature which exceeds the body? This first we ought to determine.

129. O son of Immortality, live not thou according to Nature, but according to God; and compel her also to live according to the deity within thee.

130. Fate is God’s foreknowledge outside Space & Time of all that in Space & Time shall yet happen; what He has foreseen, Power & Necessity work out by the conflict of forces.

131. Because God has willed and foreseen everything, thou shouldst not therefore sit inactive and wait upon His providence, for thy action is one of His chief effective forces. Up then and be doing, not with egoism, but as the circumstance, instrument and apparent cause of the event that He has predetermined.

132. When I knew nothing, then I abhorred the criminal, sinful and impure, being myself full of crime, sin and impurity; but when I was cleansed and my eyes unsealed, then I bowed down in my spirit before the thief and the murderer and adored the feet of the harlot; for I saw that these souls had accepted the terrible burden of evil and drained for all of us the greater portion of the churned poison of the world-ocean.

133. The Titans are stronger than the gods because they have agreed with God to front and bear the burden of His wrath and enmity; the gods were able to accept only the pleasant burden of His love and kindlier rapture.

134. When thou art able to see how necessary is suffering to final delight, failure to utter effectiveness and retardation to the last rapidity, then thou mayst begin to understand something, however faintly and dimly, of God’s workings.

135. All disease is a means towards some new joy of health, all evil & pain a tuning of Nature for some more intense bliss &
good, all death an opening on widest immortality. Why and how this should be so, is God’s secret which only the soul purified of egoism can penetrate.

136. Why is thy mind or thy body in pain? Because thy soul behind the veil wishes for the pain or takes delight in it; but if thou wilt — and perseverest in thy will — thou canst impose the spirit’s law of unmixed delight on thy lower members.

137. There is no iron or ineffugable law that a given contact shall create pain or pleasure; it is the way the soul meets the rush or pressure of Brahman upon the members from outside them that determines either reaction.

138. The force of soul in thee meeting the same force from outside cannot harmonise the measures of the contact in values of mind-experience & body-experience, therefore thou hast pain, grief or uneasiness. If thou canst learn to adjust the replies of the force in thyself to the questions of world-force, thou shalt find pain becoming pleasurable or turning into pure delightfulness. Right relation is the condition of blissfulness, ritam the key of ananda.

139. Who is the superman? He who can rise above this matter-regarding broken mental human unit and possess himself universalised and deified in a divine force, a divine love & joy and a divine knowledge.

140. If thou keepest this limited human ego & thinkest thyself the superman, thou art but the fool of thy own pride, the plaything of thy own force and the instrument of thy own illusions.

141. Nietzsche saw the superman as the lion-soul passing out of camel-hood, but the true heraldic device & token of the superman is the lion seated upon the camel which stands upon the cow of plenty. If thou canst not be the slave of all mankind, thou
art not fit to be its master and if thou canst not make thy nature as Vasistha’s cow of plenty with all mankind to draw its wish from her udders, what avails thy leonine supermanhood?

142. Be to the world as the lion in fearlessness and lordship, as the camel in patience and service, as the cow in quiet, forbearing & maternal beneficence. Raven on all the joys of God as a lion over its prey, but bring also all humanity into that infinite field of luxurious ecstasy to wallow there and to pasture.

143. If Art’s service is but to imitate Nature, then burn all the picture galleries and let us have instead photographic studios. It is because Art reveals what Nature hides, that a small picture is worth more than all the jewels of the millionaires and the treasures of the princes.

144. If you only imitate visible Nature, you will perpetrate either a corpse, a dead sketch or a monstrosity; Truth lives in that which goes behind & beyond the visible & sensible.

145. O Poet, O Artist, if thou but holdest up the mirror to Nature, thinkest thou Nature will rejoice in thy work? Rather she will turn away her face. For what dost thou hold up to her there? Herself? No, but a lifeless outline & reflection, a shadowy mimicry. It is the secret soul of Nature thou hast to seize, thou hast to hunt eternally after the truth in the external symbol, and that no mirror will hold for thee, nor for her whom thou seekest.

146. I find in Shakespeare a far greater & more consistent universalist than the Greeks. All his creations are universal types from Lancelot Gobbo & his dog up to Lear & Hamlet.

147. The Greeks sought universality by omitting all finer individual touches; Shakespeare sought it more successfully by universalising the rarest individual details of character. That which Nature uses for concealing from us the Infinite, Shakespeare used for revealing the Ananta-guna in man to the eye of humanity.
148. Shakespeare, who invented the figure of holding up the mirror to Nature, was the one poet who never condescended to a copy, a photograph or a shadow. The reader who sees in Falstaff, Macbeth, Lear or Hamlet imitations of Nature, has either no inner eye of the soul or has been hypnotised by a formula.

149. Where in material Nature wilt thou find Falstaff, Macbeth or Lear? Shadows & hints of them she possesses but they themselves tower above her.

150. There are two for whom there is hope, the man who has felt God’s touch & been drawn to it and the sceptical seeker & self-convinced atheist; but for the formularists of all the religions & the parrots of free thought, they are dead souls who follow a death that they call living.

151. A man came to a scientist and wished to be instructed; this instructor showed him the revelations of the microscope & telescope, but the man laughed and said, “These are obviously hallucinations inflicted on the eye by the glass which you use as a medium; I will not believe till you show these wonders to my naked seeing.” Then the scientist proved to him by many collateral facts & experiments the reliability of his knowledge but the man laughed again & said, “What you term proofs, I term coincidences, the number of coincidences does not constitute proof; as for your experiments, they are obviously effected under abnormal conditions & constitute a sort of insanity of Nature.” When confronted with the results of mathematics, he was angry & cried out, “This is obviously imposture, gibberish & superstition; will you try to make me believe that these absurd cabalistic figures have any real force & meaning?” Then the scientist drove him out as a hopeless imbecile; for he did not recognise his own system of denials and his own method of negative reasoning. If we wish to refuse an impartial & openminded enquiry, we can always find the most respectable polysyllables to cover our refusal or impose tests & conditions which stultify the enquiry.
152. When our minds are involved in matter, they think matter the only reality; when we draw back into immaterial consciousness, then we see matter a mask and feel existence in consciousness alone as having the touch of reality. Which then of these two is the truth? Nay, God knoweth; but he who has had both experiences, can easily tell which condition is the more fertile in knowledge, the mightier & more blissful.

153. I believe immaterial consciousness to be truer than material consciousness? Because I know in the first what in the second is hidden from me & also can command what the mind knows in matter.

154. Hell & Heaven exist only in the soul’s consciousness. Ay, but so does the earth and its lands & seas & fields & deserts & mountains & rivers. All world is nothing but arrangement of the Soul’s seeing.

155. There is only one soul & one existence; therefore we all see one objectivity only; but there are many knots of mind & ego in the one soul-existence, therefore we all see the one Object in different lights & shadows.

156. The idealist errs; it is not Mind which created the worlds, but that which created mind has created them. Mind only missees, because it sees partially & by details, what is created.

157. Thus said Ramakrishna and thus said Vivekananda. Yes, but let me know also the truths which the Avatar cast not forth into speech and the prophet has omitted from his teachings. There will always be more in God than the thought of man has ever conceived or the tongue of man has ever uttered.

158. What was Ramakrishna? God manifest in a human being; but behind there is God in His infinite impersonality and His universal Personality. And what was Vivekananda? A radiant glance from the eye of Shiva; but behind him is the divine gaze
from which he came and Shiva himself and Brahma and Vishnu and OM all-exceeding.

159. He who recognises not Krishna, the God in man, knows not God entirely; he who knows Krishna only, knows not even Krishna. Yet is the opposite truth also wholly true that if thou canst see all God in a little pale unsightly and scentless flower, then hast thou hold of His supreme reality.

160. Shun the barren snare of an empty metaphysics and the dry dust of an unfertile intellectuality. Only that knowledge is worth having which can be made use of for a living delight and put out into temperament, action, creation and being.

161. Become & live the knowledge thou hast; then is thy knowledge the living God within thee.

162. Evolution is not finished; reason is not the last word nor the reasoning animal the supreme figure of Nature. As man emerged out of the animal, so out of man the superman emerges.

163. The power to observe law rigidly is the basis of freedom; therefore in most disciplines the soul has to endure & fulfil the law in its lower members before it can rise to the perfect freedom of its divine being. Those disciplines which begin with freedom are only for the mighty ones who are naturally free or in former lives have founded their freedom.

164. Those who are deficient in the free, full and intelligent observation of a self-imposed law, must be placed in subjection to the will of others. This is one principal cause of the subjection of nations. After their disturbing egoism has been trampled under the feet of a master, they are given or, if they have force in them, attain a fresh chance of deserving liberty by liberty.

165. To observe the law we have imposed on ourselves rather
than the law of others is what is meant by liberty in our un-regenerate condition. Only in God & by the supremacy of the spirit can we enjoy a perfect freedom.

166. The double law of sin & virtue is imposed on us because we have not that ideal life & knowledge within which guides the soul spontaneously & infallibly to its self-fulfilment. The law of sin & virtue ceases for us when the sun of God shines upon the soul in truth & love with its unveiled splendour. Moses is replaced by Christ, the Shastra by the Veda.

167. God within is leading us always aright even when we are in the bonds of the ignorance; but then, though the goal is sure, it is attained by circlings & deviations.

168. The Cross is in Yoga the symbol of the soul & nature in their strong & perfect union, but because of our fall into the impurities of ignorance it has become the symbol of suffering and purification.

169. Christ came into the world to purify, not to fulfil. He himself foreknew the failure of his mission and the necessity of his return with the sword of God into a world that had rejected him.

170. Mahomed’s mission was necessary, else we might have ended by thinking, in the exaggeration of our efforts at self-purification, that earth was meant only for the monk and the city created as a vestibule for the desert.

171. When all is said, Love & Force together can save the world eventually, but not Love only or Force only. Therefore Christ had to look forward to a second advent and Mahomed’s religion, where it is not stagnant, looks forward through the Imams to a Mahdi.

172. Law cannot save the world, therefore Moses’ ordinances are dead for humanity & the Shastra of the Brahmins is corrupt
& dying. Law released into Freedom is the liberator. Not the Pandit, but the Yogin; not monasticism, but the inner renunciation of desire and ignorance & egoism.

173. Even Vivekananda once in the stress of emotion admitted the fallacy that a personal God would be too immoral to be suffered and it would be the duty of all good men to resist Him. But if an omnipotent supra-moral Will & Intelligence governs the world, it is surely impossible to resist Him; our resistance would only serve His ends & really be dictated by Him. Is it not better then, instead of condemning or denying, to study and understand Him?

174. If we would understand God, we must renounce our egoistic & ignorant human standards or else ennoble and universalise them.

175. Because a good man dies or fails & the evil live & triumph, is God therefore evil? I do not see the logic of the consequence. I must first be convinced that death & failure are evil; I sometimes think that when they come, they are our supreme momentary good. But we are the fools of our hearts & nerves & argue that what they do not like or desire, must of course be an evil!

176. When I look back on my past life, I see that if I had not failed & suffered, I would have lost my life’s supreme blessings; yet at the time of the suffering & failure, I was vexed with the sense of calamity. Because we cannot see anything but the one fact under our noses, therefore we indulge in all these sniffings and clamours. Be silent, ye foolish hearts! slay the ego, learn to see & feel vastly & universally.

177. The perfect cosmic vision & cosmic sentiment is the cure of all error & suffering; but most men succeed only in enlarging the range of their ego.

178. Men say & think “For my country!” “For humanity!”
“For the world!” but they really mean “For myself seen in my country!” “For myself seen in humanity!” “For myself imaged to my fancy as the world!” That may be an enlargement, but it is not liberation. To be at large & to be in a large prison are not one condition of freedom.

179. Live for God in thy neighbour, God in thyself, God in thy country & the country of thy foeman, God in humanity, God in tree & stone & animal, God in the world & outside the world, then art thou on the straight path to liberation.

180. There are lesser & larger eternities, for eternity is a term of the soul & can exist in Time as well as exceeding it. When the Scriptures say “śāśwatih samah”, they mean for a long space & permanence of time or a hardly measurable aeon; only God Absolute has the absolute eternity. Yet when one goes within, one sees that all things are secretly eternal; there is no end, neither was there ever a beginning.

181. When thou callest another a fool, as thou must, sometimes, yet do not forget that thou thyself hast been the supreme fool in humanity.

182. God loves to play the fool in season; man does it in season & out of season. It is the only difference.

183. In the Buddhists’ view to have saved an ant from drowning is a greater work than to have founded an empire. There is a truth in the idea, but a truth that can easily be exaggerated.

184. To exalt one virtue, — compassion even, — unduly above all others is to cover up with one’s hand the eyes of wisdom. God moves always towards a harmony.

185. Pity may be reserved, so long as thy soul makes distinctions, for the suffering animals; but humanity deserves from thee something nobler; it asks for love, for understanding, for comradeship, for the help of the equal & brother.
186. The contributions of evil to the good of the world & the harm sometimes done by the virtuous are distressing to the soul enamoured of good. Nevertheless be not distressed nor confounded, but study rather & calmly understand God’s ways with humanity.

187. In God’s providence there is no evil, but only good or its preparation.

188. Virtue & vice were made for thy soul’s struggle & progress; but for results they belong to God, who fulfils himself beyond vice & virtue.

189. Live within; be not shaken by outward happenings.

190. Fling not thy alms abroad everywhere in an ostentation of charity; understand & love where thou helpest. Let thy soul grow within thee.

191. Help the poor while the poor are with thee; but study also & strive that there may be no poor for thy assistance.

192. The old Indian social ideal demanded of the priest voluntary simplicity of life, purity, learning and the gratuitous instruction of the community, of the prince, war, government, protection of the weak & the giving up of his life in the battlefield, of the merchant, trade, gain and the return of his gains to the community by free giving, of the serf, labour for the rest & material havings. In atonement for his serfhood, it spared him the tax of self-denial, the tax of blood & the tax of his riches.

193. The existence of poverty is the proof of an unjust & ill-organised society, and our public charities are but the first tardy awakening in the conscience of a robber.

194. Valmekie, our ancient epic poet, includes among the signs
of a just & enlightened state of society not only universal education, morality and spirituality but this also that there shall be “none who is compelled to eat coarse food, none uncrowned & unanointed or who is restricted to a mean and petty share of luxuries.”

195. The acceptance of poverty is noble & beneficial in a class or an individual, but it becomes fatal and pauperises life of its richness & expansion if it is perverted into a general or national ideal. Athens, not Sparta, is the progressive type for mankind. Ancient India with its ideal of vast riches & vast spending was the greatest of nations; modern India with its trend towards national asceticism has finally become poor in life & sunk into weakness & degradation.

196. Poverty is no more a necessity of organised social life than disease of the natural body; false habits of life & an ignorance of our true organisation are in both cases the peccant causes of an avoidable disorder.

197. Do not dream that when thou hast got rid of material poverty, men will even so be happy or satisfied or society freed from ills, troubles & problems. This is only the first & lowest necessity. While the soul within remains defectively organised, there will always be outward unrest, disorder & revolution.

198. Disease will always return to the body if the soul is flawed; for the sins of the mind are the secret cause of the sins of the body. So too poverty & trouble will always return on man in society, so long as the mind of the race is subjected to egoism.

199. Religion & philosophy seek to rescue man from his ego; then the kingdom of heaven within will be spontaneously reflected in an external divine city.

200. Mediaeval Christianity said to the race, “Man, thou art in thy earthly life an evil thing & a worm before God; renounce
then egoism, live for a future state and submit thyself to God & His priest.” The results were not over-good for humanity. Modern knowledge says to the race, “Man, thou art an ephemeral animal and no more to Nature than the ant & the earthworm, — a transitory speck only in the universe. Live then for the State & submit thyself antlike to the trained administrator & the scientific expert.” Will this gospel succeed any better than the other?

201. Vedanta says rather, “Man, thou art of one nature & substance with God, one soul with thy fellow-men. Awake & progress then to thy utter divinity, live for God in thyself & in others.” This gospel which was given only to the few, must now be offered to all mankind for its deliverance.

202. The human race always progresses most when most it asserts its importance to Nature, its freedom & its universality.

203. Animal man is the obscure starting-point, the present natural man the varied & tangled mid-road but supernatural man the luminous & transcendent goal of our human journey.

204. Life and action culminate and are eternally crowned for thee when thou hast attained the power of symbolising & manifesting in every thought & act, in wealth getting, wealth having or wealth spending, in home & government & society, in art, literature and life, the One Immortal in this lower mortal being.
Karma
Karma

205. God leads man while man is misleading himself, the higher nature watches over the stumblings of his lower mortality; this is the tangle & contradiction out of which we have to escape into the [?]self-unity] to which alone is possible a clear knowledge & a faultless action.

206. That thou shouldst have pity on creatures, is well, but not well, if thou art a slave to thy pity. Be a slave to nothing except to God, not even to His most luminous angels.

207. Beatitude is God’s aim for humanity; get this supreme good for thyself first that thou mayst distribute it entirely to thy fellow-beings.

208. He who acquires for himself alone, acquires ill though he may call it heaven and virtue.

209. In my ignorance I thought anger could be noble and vengeance grandiose; but now when I watch Achilles in his epic fury, I see a very fine baby in a very fine rage and I am pleased and amused.

210. Power is noble, when it overtops anger; destruction is grandiose, but it loses caste when it proceeds from vengeance. Leave these things, for they belong to a lower humanity.

211. Poets make much of death and external afflictions; but the only tragedies are the soul’s failures and the only epic man’s triumphant ascent towards godhead.

212. The tragedies of the heart & the body are the weeping of children over their little griefs & their broken toys. Smile within
thyself, but comfort the children; join also, if thou canst, in their play.

213. “There is always something abnormal and eccentric about men of genius.” And why not? For genius itself is an abnormal birth and out of man’s ordinary centre.

214. Genius is Nature’s first attempt to liberate the imprisoned god out of her human mould; the mould has to suffer in the process. It is astonishing that the cracks are so few and unimportant.

215. Nature sometimes gets into a fury with her own resistance, then she damages the brain in order to free the inspiration; for in this effort the equilibrium of the average material brain is her chief opponent. Pass over the madness of such and profit by their inspiration.

216. Who can bear Kali rushing into the system in her fierce force and burning godhead? Only the man whom Krishna already possesses.

217. Hate not the oppressor, for, if he is strong, thy hate increases his force of resistance; if he is weak, thy hate was needless.

218. Hatred is a sword of power, but its edge is always double. It is like the Kritya of the ancient magicians which, if baulked of its prey, returned in fury to devour its sender.

219. Love God in thy opponent, even while thou strikest him; so shall neither have hell for his portion.

220. Men talk of enemies, but where are they? I only see wrestlers of one party or the other in the great arena of the universe.

221. The saint and the angel are not the only divinities; admire also the Titan and the giant.
222. The old writings call the Titans the elder gods. So they still are; nor is any god entirely divine unless there is hidden in him also a Titan.

223. If I cannot be Rama, then I would be Ravana; for he is the dark side of Vishnu.

224. Sacrifice, sacrifice, sacrifice always, but for the sake of God and humanity, not for the sake of sacrifice.

225. Selfishness kills the soul; destroy it. But take care that your altruism does not kill the souls of others.

226. Very usually, altruism is only the sublimest form of selfishness.

227. He who will not slay when God bids him, works in the world an incalculable havoc.

228. Respect human life as long as you can; but respect more the life of humanity.

229. Men slay out of uncontrollable anger, hatred or vengeance; they shall suffer the rebound now or hereafter; or they slay to serve a selfish end, colder; God shall not pardon them. If thou slay, first let thy soul have known death for a reality & seen God in the smitten, the stroke & the striker.

230. Courage and love are the only indispensable virtues; even if all the others are eclipsed or fall asleep, these two will save the soul alive.

231. Meanness & selfishness are the only sins that I find it difficult to pardon; yet they alone are almost universal. Therefore these also must not be hated in others, but in ourselves annihilated.
232. Nobleness and generosity are the soul’s ethereal firmament; without them, one looks at an insect in a dungeon.

233. Let not thy virtues be such as men praise or reward, but such as make for thy perfection and God in thy nature demands of thee.

234. Altruism, duty, family, country, humanity are the prisons of the soul when they are not its instruments.

235. Our country is God the Mother; speak not evil of her unless thou canst do it with love and tenderness.

236. Men are false to their country for their own profit; yet they go on thinking they have a right to turn in horror from the matricide.

237. Break the moulds of the past, but keep safe its gains and its spirit, or else thou hast no future.

238. Revolutions hew the past to pieces and cast it into a cauldron, but what has emerged is the old Aeson with a new visage.

239. The world has had only half a dozen successful revolutions and most even of these were very like failures; yet it is by great & noble failures that humanity advances.

240. Atheism is a necessary protest against the wickedness of the Churches and the narrowness of creeds. God uses it as a stone to smash these soiled card-houses.

241. How much hatred & stupidity men succeed in packing up decorously and labelling “Religion”!

242. God guides best when He tempts worst, loves entirely when He punishes cruelly, helps perfectly when violently He opposes.
243. If God did not take upon Himself the burden of tempting men, the world would very soon go to perdition.

244. Suffer yourself to be tempted within so that you may exhaust in the struggle your downward propensities.

245. If you leave it to God to purify, He will exhaust the evil in you subjectively; but if you insist on guiding yourself, you will fall into much outward sin and suffering.

246. Call not everything evil which men call evil, but only that reject which God has rejected; call not everything good which men call good, but accept only what God has accepted.

247. Men in the world have two lights, duty and principle; but he who has passed over to God, has done with both and replaced them by God's will. If men abuse thee for this, care not, O divine instrument, but go on thy way like the wind or the sun fostering and destroying.

248. Not to cull the praises of men has God made thee His own, but to do fearlessly His bidding.

249. Accept the world as God's theatre; be thou the mask of the Actor and let Him act through thee. If men praise or hiss thee, know that they too are masks & take God within for thy only critic and audience.

250. If Krishna be alone on one side and the armed & organised world with its hosts and its shrapnel and its Maxims on the other, yet prefer thy divine solitude. Care not if the world passes over thy body and its shrapnel tear thee to pieces and its cavalry trample thy limbs into shapeless mire by the wayside; for the mind was always a simulacrum and the body a carcass. The spirit liberated from its casings ranges and triumphs.

251. If thou think defeat is the end of thee, then go not forth to fight, even though thou be the stronger. For Fate is not purchased
by any man nor is Power bound over to her possessors. But
defeat is not the end, it is only a gate or a beginning.

252. I have failed, thou sayest. Say rather that God is circling
about towards His object.

253. Foiled by the world, thou turnest to seize upon God. If the
world is stronger than thou, thinkest thou God is weaker? Turn
to Him rather for His bidding and for strength to fulfil it.

254. So long as a cause has on its side one soul that is intangible
in faith, it cannot perish.

255. Reason gives me no basis for this faith, thou murmurrest.
Fool! if it did, faith would not be needed or demanded of thee.

256. Faith in the heart is the obscure & often distorted reflection
of a hidden knowledge. The believer is often more plagued by
doubt than the most inveterate sceptic. He persists because there
is something subconscient in him which knows. That tolerates
both his blind faith & twilit doubts and drives towards the
revelation of that which it knows.

257. The world thinks that it moves by the light of reason but
it is really impelled by its faiths and instincts.

258. Reason adapts itself to the faith or argues out a justification
of the instincts, but it receives the impulse subconsciously;
therefore men think that they act rationally.

259. The only business of reason is to arrange and criticise
the perceptions. It has neither in itself any means of positive
conclusion nor any command to action. When it pretends to
originate or impel, it is masking other agencies.

260. Until Wisdom comes to thee, use the reason for its God-
given purposes and faith and instinct for theirs. Why shouldst
thou set thy members to war upon each other?
261. Perceive always and act in the light of thy increasing perceptions, but not those of the reasoning brain only. God speaks to the heart when the brain cannot understand him.

262. If thy heart tell thee, Thus & by such means and at such a time it will happen, believe it not. But if it gives thee the purity and wideness of God’s command, hearken to it.

263. When thou hast the command, care only to fulfil it. The rest is God’s will and arrangement which men call chance and luck and fortune.

264. If thy aim be great and thy means small, still act; for by action alone these can increase to thee.

265. Care not for time and success. Act out thy part, whether it be to fail or to prosper.

266. There are three forms in which the command may come, the will and faith in thy nature, thy ideal on which heart and brain are agreed and the voice of Himself or His angels.

267. There are times when action is unwise or impossible; then go into tapasya in some physical solitude or in the retreats of thy soul and await whatever divine word or manifestation.

268. Leap not too quickly at all voices, for there are lying spirits ready to deceive thee; but let thy heart be pure and afterwards listen.

269. There are times when God seems to be sternly on the side of the past; then what has been and is, sits firm as on a throne and clothes itself with an irrevocable “I shall be”. Then persevere, though thou seem to be fighting the Master of all; for this is His sharpest trial.

270. All is not settled when a cause is humanly lost and hopeless; all is settled, only when the soul renounces its effort.
271. He who would win high spiritual degrees, must pass endless tests and examinations. But most are anxious only to bribe the examiner.

272. Fight, while thy hands are free, with thy hands and thy voice and thy brain and all manner of weapons. Art thou chained in the enemy's dungeons and have his gags silenced thee? Fight with thy silent all-besieging soul and thy wide-ranging will-power and when thou art dead, fight still with the world-encompassing force that went out from God within thee.

273. Thou thinkst the ascetic in his cave or on his mountaintop a stone and a do-nothing? What dost thou know? He may be filling the world with the mighty currents of his will & changing it by the pressure of his soul-state.

274. That which the liberated sees in his soul on its mountaintops, heroes and prophets spring up in the material world to proclaim and accomplish.

275. The Theosophists are wrong in their circumstances but right in the essential. If the French Revolution took place, it was because a soul on the Indian snows dreamed of God as freedom, brotherhood and equality.

276. All speech and action comes prepared out of the eternal Silence.

277. There is no disturbance in the depths of the Ocean, but above there is the joyous thunder of its shouting and its racing shoreward; so is it with the liberated soul in the midst of violent action. The soul does not act; it only breathes out from itself overwhelming action.

278. O soldier and hero of God, where for thee is sorrow or shame or suffering? For thy life is a glory, thy deeds a consecration, victory thy apotheosis, defeat thy triumph.
279. Do thy lower members still suffer the shock of sin and sorrow? But above, seen of thee or unseen, thy soul sits royal, calm, free and triumphant. Believe that the Mother will ere the end have done her work and made the very earth of thy being a joy and a purity.

280. If thy heart is troubled within thee, if for long seasons thou makest no progress, if thy strength faint and repine, remember always the eternal word of our Lover and Master, “I will free thee from all sin and evil; do not grieve.”

281. Purity is in thy soul; but for actions, where is their purity or impurity?

282. O Death, our masked friend and maker of opportunities, when thou wouldst open the gate, hesitate not to tell us beforehand; for we are not of those who are shaken by its iron jarring.

283. Death is sometimes a rude valet; but when he changes this robe of earth for that brighter raiment, his horseplay and impertinences can be pardoned.

284. Who shall slay thee, O soul immortal? Who shall torture thee, O God ever-joyous?

285. Think this when thy members would fain make love with depression and weakness, “I am Bacchus and Ares and Apollo; I am Agni pure and invincible; I am Surya ever burning mightily.”

286. Shrink not from the Dionysian cry & rapture within thee, but see that thou be not a straw upon those billows.

287. Thou hast to learn to bear all the gods within thee and never stagger with their inrush or break under their burden.

288. Mankind have wearied of strength and joy and called sorrow and weakness virtue, wearied of knowledge and called
ignorance holiness, wearied of love and called heartlessness enlightenment and wisdom.

289. There are many kinds of forbearance. I saw a coward hold out his cheek to the smiter; I saw a physical weakling struck by a strong and self-approving bully look quietly & intently at the aggressor; I saw God incarnate smile lovingly on those who stoned him. The first was ridiculous, the second terrible, the third divine and holy.

290. It is noble to pardon thine own injurers, but not so noble to pardon wrongs done to others. Nevertheless pardon these too, but when needful, calmly avenge.

291. When Asiatics massacre, it is an atrocity; when Europeans, it is a military exigency. Appreciate the distinction and ponder over this world's virtues.

292. Watch the too indignantly righteous. Before long you will find them committing or condoning the very offence which they have so fiercely censured.

293. “There is very little real hypocrisy among men.” True, but there is a great deal of diplomacy and still more of self-deceit. The last is of three varieties, conscious, subconscious and half-conscious; but the third is the most dangerous.

294. Be not deceived by men's shows of virtue, neither disgusted by their open or secret vices. These things are the necessary shufflings in a long transition-period of humanity.

295. Be not repelled by the world's crookednesses; the world is a wounded and venomous snake wriggling towards a destined off-sloughing and perfection. Wait; for it is a divine wager, and out of this baseness, God will emerge brilliant and triumphant.

296. Why dost thou recoil from a mask? Behind its odious, grotesque or terrible seemings Krishna laughs at thy foolish
anger, thy more foolish scorn or loathing and thy most foolish terror.

297. When thou findest thyself scorning another, look then at thy own heart and laugh at thy folly.

298. Avoid vain disputing; but exchange views freely. If dispute thou must, learn from thy adversary; for even from a fool, if thou listen not with the ear and the reasoning mind but the soul’s light, thou canst gather much wisdom.

299. Turn all things to honey; this is the law of divine living.

300. Private dispute should always be avoided; but shrink not from the public battle; yet even there appreciate the strength of thy adversary.

301. When thou hearest an opinion that displeases thee, study and find out the truth in it.

302. The mediaeval ascetics hated women and thought they were created by God for the temptation of monks. One may be allowed to think more nobly both of God and of woman.

303. If a woman has tempted thee, is it her fault or thine? Be not a fool and a self-deceiver.

304. There are two ways of avoiding the snare of woman; one is to shun all women and the other to love all beings.

305. Asceticism is no doubt very healing, a cave very peaceful and the hill-tops wonderfully pleasant; nevertheless do thou act in the world as God intended thee.

306. Three times God laughed at Shankara, first, when he returned to burn the corpse of his mother, again when he commented on the Isha Upanishad and the third time when he stormed about India preaching inaction.
307. Men labour only after success and if they are fortunate enough to fail, it is because the wisdom and force of Nature overbear their intellectual cleverness. God alone knows when & how to blunder wisely and fail effectively.

308. Distrust the man who has never failed and suffered; follow not his fortunes, fight not under his banner.

309. There are two who are unfit for greatness and freedom, the man who has never been a slave to another and the nation that has never been under the yoke of foreigners.

310. Fix not the time and the way in which the ideal shall be fulfilled. Work and leave time and way to God all-knowing.

311. Work as if the ideal had to be fulfilled swiftly & in thy lifetime; persevere as if thou knewest it not to be unless purchased by a thousand years yet of labour. That which thou darest not expect till the fifth millennium, may bloom out with tomorrow’s dawning and that which thou hopest and lustest after now, may have been fixed for thee in thy hundredth advent.

312. Each man of us has a million lives yet to fulfil upon earth. Why then this haste and clamour and impatience?

313. Stride swiftly for the goal is far; rest not unduly, for thy Master is waiting for thee at the end of thy journey.

314. I am weary of the childish impatience which cries & blasphemes and denies the ideal because the Golden Mountains cannot be reached in our little day or in a few momentary centuries.

315. Fix thy soul without desire upon the end and insist on it by the divine force within thee; then shall the end itself create its means, nay, it shall become its own means. For the end is Brahman and already accomplished; see it always as Brahman, see it always in thy soul as already accomplished.
316. Plan not with the intellect, but let thy divine sight arrange thy plans for thee. When a means comes to thee as thing to be done, make that thy aim; as for the end, it is, in world, accomplishing itself and, in thy soul, already accomplished.

317. Men see events as unaccomplished, to be striven for and effected. This is false seeing; events are not effected, they develop. The event is Brahman, already accomplished from of old, it is now manifesting.

318. As the light of a star reaches the earth hundreds of years after the star has ceased to exist, so the event already accomplished in Brahman at the beginning manifests itself now in our material experience.

319. Governments, societies, kings, police, judges, institutions, churches, laws, customs, armies are temporary necessities imposed on us for a few groups of centuries because God has concealed His face from us. When it appears to us again in its truth & beauty, then in that light they will vanish.

320. The anarchic is the true divine state of man in the end as in the beginning; but in between it would lead us straight to the devil and his kingdom.

321. The communistic principle of society is intrinsically as superior to the individualistic as is brotherhood to jealousy and mutual slaughter; but all the practical schemes of Socialism invented in Europe are a yoke, a tyranny and a prison.

322. If communism ever reestabishes itself successfully upon earth, it must be on a foundation of soul’s brotherhood and the death of egoism. A forced association and a mechanical comradeship would end in a worldwide fiasco.

323. Vedanta realised is the only practicable basis for a communist society. It is the kingdom of the saints dreamed of by Christianity, Islam and Puranic Hinduism.
324. “Freedom, equality, brotherhood,” cried the French revolutionists, but in truth freedom only has been practised with a dose of equality; as for brotherhood, only a brotherhood of Cain was founded — and of Barabbas. Sometimes it calls itself a Trust or Combine and sometimes the Concert of Europe.

325. “Since liberty has failed,” cries the advanced thought of Europe, “let us try liberty cum equality or, since the two are a little hard to pair, equality instead of liberty. For brotherhood, it is impossible; therefore we will replace it by industrial association.” But this time also, I think, God will not be deceived.

326. India had three fortresses of a communal life, the village community, the larger joint family & the orders of the Sannyasins; all these are broken or breaking with the stride of egoistic conceptions of social life; but is not this after all only the breaking of these imperfect moulds on the way to a larger & diviner communism?

327. The individual cannot be perfect until he has surrendered all he now calls himself to the divine Being. So also, until mankind gives all it has to God, never shall there be a perfected society.

328. There is nothing small in God's eyes; let there be nothing small in thine. He bestows as much labour of divine energy on the formation of a shell as on the building of an empire. For thyself it is greater to be a good shoemaker than a luxurious and incompetent king.

329. Imperfect capacity & effect in the work that is meant for thee is better than an artificial competency & a borrowed perfection.

330. Not result is the purpose of action, but God’s eternal delight in becoming, seeing and doing.
331. God's world advances step by step fulfilling the lesser unit before it seriously attempts the larger. Affirm free nationality first, if thou wouldst ever bring the world to be one nation.

332. A nation is not made by a common blood, a common tongue or a common religion; these are only important helps and powerful conveniences. But wherever communities of men not bound by family ties are united in one sentiment and aspiration to defend a common inheritance from their ancestors or assure a common future for their posterity, there a nation is already in existence.

333. Nationality is a stride of the progressive God passing beyond the stage of the family; therefore the attachment to clan and tribe must weaken or perish before a nation can be born.

334. Family, nationality, humanity are Vishnu’s three strides from an isolated to a collective unity. The first has been fulfilled, we yet strive for the perfection of the second, towards the third we are reaching out our hands and the pioneer work is already attempted.

335. With the present morality of the human race a sound and durable human unity is not yet possible; but there is no reason why a temporary approximation to it should not be the reward of strenuous aspiration and untiring effort. By constant approximations and by partial realisations and temporary successes Nature advances.

336. Imitation is sometimes a good training-ship; but it will never fly the flag of the admiral.

337. Rather hang thyself than belong to the horde of successful imitators.

338. Tangled is the way of works in the world. When Rama the Avatar murdered Vali or Krishna, who was God himself,
assassinated, to liberate his nation, his tyrant uncle Kansa, who shall say whether they did good or did evil? But this we can feel, that they acted divinely.

339. Reaction perfects & hastens progress by increasing & purifying the force within it. This is what the multitude of the weak cannot see who despair of their port when the ship is fleeing helplessly before the storm wind, but it flees, hidden by the rain & the Ocean furrow, towards God's intended haven.

340. Democracy was the protest of the human soul against the allied despotisms of autocrat, priest and noble; Socialism is the protest of the human soul against the despotism of a plutocratic democracy; Anarchism is likely to be the protest of the human soul against the tyranny of a bureaucratic Socialism. A turbulent and eager march from illusion to illusion and from failure to failure is the image of European progress.

341. Democracy in Europe is the rule of the Cabinet minister, the corrupt deputy or the self-seeking capitalist masqued by the occasional sovereignty of a wavering populace; Socialism in Europe is likely to be the rule of the official and policeman masqued by the theoretic sovereignty of an abstract State. It is chimerical to enquire which is the better system; it would be difficult to decide which is the worse.

342. The gain of democracy is the security of the individual's life, liberty and goods from the caprices of the tyrant one or the selfish few; its evil is the decline of greatness in humanity.

343. This erring race of human beings dreams always of perfecting their environment by the machinery of government and society; but it is only by the perfection of the soul within that the outer environment can be perfected. What thou art within, that outside thee thou shalt enjoy; no machinery can rescue thee from the law of thy being.
344. Be always vigilant against thy human proneness to persecute or ignore the reality even while thou art worshiping its semblance or token. Not human wickedness but human fallibility is the opportunity of Evil.

345. Honour the garb of the ascetic, but look also at the wearer, lest hypocrisy occupy the holy places and inward saintliness become a legend.

346. The many strive after competence or riches, the few embrace poverty as a bride; but, for thyself, strive after and embrace God only. Let Him choose for thee a king’s palace or the bowl of the beggar.

347. What is vice but an enslaving habit and virtue but a human opinion? See God and do His will; walk in whatever path He shall trace for thy goings.

348. In the world's conflicts espouse not the party of the rich for their riches, nor of the poor for their poverty, of the king for his power & majesty, nor of the people for their hope and fervour, but be on God's side always. Unless indeed He has commanded thee to war against Him! then do that with thy whole heart and strength and rapture.

349. How shall I know God’s will with me? I have to put egoism out of me, hunting it from every lair & burrow, and bathe my purified and naked soul in His infinite workings; then He himself will reveal it to me.

350. Only the soul that is naked and unashamed, can be pure and innocent, even as Adam was in the primal garden of humanity.

351. Boast not thy riches, neither seek men’s praise for thy poverty and self-denial; both these things are the coarse or the fine food of egoism.
352. Altruism is good for man, but less good when it is a form of supreme self-indulgence & lives by pampering the selfishness of others.

353. By altruism thou canst save thy soul, but see that thou save it not by indulging in his perdition thy brother.

354. Self-denial is a mighty instrument for purification; it is not an end in itself nor a final law of living. Not to mortify thyself but to satisfy God in the world must be thy object.

355. It is easy to distinguish the evil worked by sin & vice, but the trained eye sees also the evil done by self-righteous or self-regarding virtue.

356. The Brahmin first ruled by the book & the ritual, the Kshatriya next by the sword and the buckler; now the Vaishya governs us by machinery & the dollar, & the Sudra, the liberated serf, presses in with his doctrine of the kingdom of associated labour. But neither priest, king, merchant nor labourer is the true governor of humanity; the despotism of the tool and the mattock will fail like all the preceding despotisms. Only when egoism dies & God in man governs his own human universality, can this earth support a happy and contented race of beings.

357. Men run after pleasure and clasp feverishly that burning bride to their tormented bosoms; meanwhile a divine & faultless bliss stands behind them waiting to be seen and claimed and captured.

358. Men hunt after petty successes & trivial masteries from which they fall back into exhaustion & weakness; meanwhile all the infinite force of God in the universe waits vainly to place itself at their disposal.

359. Men burrow after little details of knowledge and group them into bounded & ephemeral thought systems; meanwhile
all infinite wisdom laughs above their heads & shakes wide the glory of her iridescent pinions.

360. Men seek laboriously to satisfy & complement the little bounded being made of the mental impressions they have grouped about a mean & grovelling ego; meanwhile the spaceless & timeless Soul is denied its joyous & splendid manifestation.

361. O soul of India, hide thyself no longer with the darkened Pandits of the Kaliyuga in the kitchen & the chapel, veil not thyself with the soulless rite, the obsolete law and the unstressed money of the dakshina; but seek in thy soul, ask of God and recover thy true Brahminhood & Kshatriyahood with the eternal Veda; restore the hidden truth of the Vedic sacrifice, return to the fulfilment of an older & mightier Vedanta.

362. Limit not sacrifice to the giving up of earthly goods or the denial of some desires & yearnings, but let every thought and every work & every enjoyment be an offering to God within thee. Let thy steps walk in thy Lord, let thy sleep and waking be a sacrifice to Krishna.

363. This is not according to my Shastra or my Science, say the men of rule, formalists. Fool! is God then only a book that there should be nothing true & good except what is written?

364. By which standard shall I walk, the word that God speaks to me, saying “This is My will, O my servant,” or the rules that men who are dead, have written? Nay, if I have to fear & obey any, I will fear & obey God rather & not the pages of a book or the frown of a Pandit.

365. Thou mayst be deceived, wilt thou say, it may not be God’s voice leading thee? Yet do I know that He abandons not those who have trusted Him even ignorantly, yet have I found that He
leads wisely & lovingly even when He seems to deceive utterly, yet would I rather fall into the snare of the living God than be saved by trust in a dead formulary.

366. Act according to the Shastra rather than thy self-will & desire; so shalt thou grow stronger to control the ravener in thee; but act according to God rather than the Shastra; so shalt thou reach to His highest which is far above rule & limit.

367. The Law is for the bound & those whose eyes are sealed; if they walk not by it, they will stumble; but thou who art free in Krishna or hast seen his living light, walk holding the hand of thy Friend & by the lamp of eternal Veda.

368. The Vedanta is God’s lamp to lead thee out of this night of bondage & egoism; but when the light of Veda has dawned in thy soul, then even that divine lamp thou needest not, for now thou canst walk freely & surely in a high & eternal sunlight.

369. What is the use of only knowing? I say to thee, Act and be, for therefore God sent thee into this human body.

370. What is the use of only being? I say to thee, Become, for therefore wast thou established as a man in this world of matter.

371. The path of works is in a way the most difficult side of God’s triune causeway; yet is it not also, in this material world at least, the easiest, widest & most delightful? For at every moment we clash against God the worker & grow into His being by a thousand divine touches.

372. This is the wonder of the way of works that even enmity to God can be made an agency of salvation. Sometimes God draws and attaches us most swiftly to Him by wrestling with us as our fierce, invincible & irreconcilable enemy.

373. Shall I accept death or shall I turn and wrestle with him
and conquer? That shall be as God in me chooses. For whether
I live or die, I am always.

374. What is this thing thou callest death? Can God die? O
thou who fearest death, it is Life that has come to thee sporting
with a death-head and wearing a mask of terror.

375. There is a means to attain physical immortality and
death is by our choice, not by Nature’s compulsion. But
who would care to wear one coat for a hundred years or
be confined in one narrow & changeless lodging unto a long
eternity?

376. Fear and anxiety are perverse forms of will. What thou
fearest & ponderest over, striking that note repeatedly in thy
mind, thou helpest to bring about; for, if thy will above the
surface of waking repels it, it is yet what thy mind underneath
is all along willing, & the subconscious mind is mightier, wider,
better equipped to fulfil than thy waking force & intellect. But
the spirit is stronger than both together; from fear and hope take
refuge in the grandiose calm and careless mastery of the spirit.

377. God made the infinite world by Self-knowledge which in
its works is Will-Force self-fulfilling. He used ignorance to limit
His infinity; but fear, weariness, depression, self-distrust and
assent to weakness are the instruments by which He destroys
what He created. When these things are turned on what is evil
or harmful & ill-regulated within thee, then it is well; but if they
attack thy very sources of life & strength, then seize & expel
them or thou diest.

378. Mankind has used two powerful weapons to destroy its
own powers and enjoyment, wrong indulgence and wrong ab-
stinance.

379. Our mistake has been and is always to flee from the ills
of Paganism to asceticism as a remedy and from the ills of asceticism back to Paganism. We swing for ever between two false opposites.

380. It is well not to be too loosely playful in one’s games or too grimly serious in one’s life and works. We seek in both a playful freedom and a serious order.

381. For nearly forty years I believed them when they said I was weakly in constitution, suffered constantly from the smaller & the greater ailments & mistook this curse for a burden that Nature had laid upon me. When I renounced the aid of medicines, then they began to depart from me like disappointed parasites. Then only I understood what a mighty force was the natural health within me & how much mightier yet the Will & Faith exceeding mind which God meant to be the divine support of our life in this body.

382. Machinery is necessary to modern humanity because of our incurable barbarism. If we must incase ourselves in a bewildering multitude of comforts and trappings, we must needs do without Art and its methods; for to dispense with simplicity & freedom is to dispense with beauty. The luxury of our ancestors was rich & even gorgeous, but never encumbered.

383. I cannot give to the barbarous comfort & encumbered ostentation of European life the name of civilisation. Men who are not free in their souls & nobly rhythmical in their appointments, are not civilised.

384. Art in modern times & under European influence has become an excrescence upon life or an unnecessary menial; it should have been its chief steward and indispensable arranger.

385. Disease is needlessly prolonged & ends in death oftener than is inevitable, because the mind of the patient supports & dwells upon the disease of his body.
386. Medical Science has been more a curse to mankind than a blessing. It has broken the force of epidemics and unveiled a marvellous surgery; but, also, it has weakened the natural health of man and multiplied individual diseases; it has implanted fear and dependence in the mind and body; it has taught our health to repose not on natural soundness but a rickety & distasteful crutch compact from the mineral and vegetable kingdoms.

387. The doctor aims a drug at a disease; sometimes it hits, sometimes misses. The misses are left out of account, the hits treasured up, reckoned and systematised into a science.

388. We laugh at the savage for his faith in the medicine man; but how are the civilised less superstitious who have faith in the doctors? The savage finds that when a certain incantation is repeated, he often recovers from a certain disease; he believes. The civilised patient finds that when he doses himself according to a certain prescription, he often recovers from a certain disease; he believes. Where is the difference?

389. The north-country Indian herdsman, attacked by fever, sits in the chill stream of a river for an hour or more & rises up free & healthy. If the educated man did the same, he would perish, not because the same remedy in its nature kills one & cures another, but because our bodies have been fatally indoctrinated by the mind into false habits.

390. It is not the medicine that cures so much as the patient’s faith in the doctor and the medicine. Both are a clumsy substitute for the natural faith in one’s own self-power which they have themselves destroyed.

391. The healthiest ages of mankind were those in which there were the fewest material remedies.

392. The most robust and healthy race left on earth were the African savages; but how long can they so remain after their
physical consciousness has been contaminated by the mental aberrations of the civilised?

393. We ought to use the divine health in us to cure and prevent diseases; but Galen and Hippocrates & their tribe have given us instead an armoury of drugs and a barbarous Latin hocuspocus as our physical gospel.

394. Medical Science is well-meaning and its practitioners often benevolent and not seldom self-sacrificing; but when did the well-meaning of the ignorant save them from harm-doing?

395. If all remedies were really and in themselves efficacious and all medical theories sound, how would that console us for our lost natural health and vitality? The upas-tree is sound in all its parts, but it is still an upas-tree.

396. The spirit within us is the only all-efficient doctor and submission of the body to it the one true panacea.

397. God within is infinite and self-fulfilling Will. Unappalled by the fear of death, canst thou leave to Him, not as an experiment, with a calm & entire faith thy ailments? Thou shalt find in the end that He exceeds the skill of a million doctors.

398. Health protected by twenty thousand precautions is the gospel of the doctor; but it is not God’s evangel for the body, nor Nature’s.

399. Man was once naturally healthy and could revert to that primal condition if he were suffered; but Medical Science pursues our body with an innumerable pack of drugs and assails the imagination with ravening hordes of microbes.

400. I would rather die and have done with it than spend life in defending myself against a phantasmal siege of microbes. If that is to be barbarous [and] unenlightened, I embrace gladly my Cimmerian darkness.
401. Surgeons save & cure by cutting and maiming. Why not rather seek to discover Nature’s direct all-powerful remedies?

402. It should take long for self-cure to replace medicine, because of the fear, self-distrust and unnatural physical reliance on drugs which Medical Science has taught to our minds & bodies & made our second nature.

403. Medicine is necessary for our bodies in disease only because our bodies have learned the art of not getting well without medicines. Even so, one sees often that the moment Nature chooses for recovery is that in which the life is abandoned as hopeless by the doctors.

404. Distrust of the curative power within us was our physical fall from Paradise. Medical Science and a bad heredity are the two angels of God who stand at the gates to forbid our return and reentry.

405. Medical Science to the human body is like a great Power which enfeebles a smaller State by its protection or like a benevolent robber who knocks his victim flat and riddles him with wounds in order that he may devote his life to healing & serving the shattered body.

406. Drugs often cure the body when they do not merely trouble or poison it, but only if their physical attack on the disease is supported by the force of the spirit; if that force can be made to work freely, drugs are at once superfluous.
Bhakti
Bhakti

407. I am not a Bhakta, for I have not renounced the world for God. How can I renounce what He took from me by force and gave back to me against my will? These things are too hard for me.

408. I am not a Bhakta, I am not a Jnani, I am not a worker for the Lord. What am I then? A tool in the hands of my Master, a flute blown upon by the divine Herd-Boy, a leaf driven by the breath of the Lord.

409. Devotion is not utterly fulfilled till it becomes action and knowledge. If thou pursuest after God and canst overtake Him, let Him not go till thou hast His reality. If thou hast hold of His reality, insist on having also His totality. The first will give thee divine knowledge, the second will give thee divine works and a free and perfect joy in the universe.

410. Others boast of their love for God. My boast is that I did not love God; it was He who loved me and sought me out and forced me to belong to Him.

411. After I knew that God was a woman, I learned something from far-off about love; but it was only when I became a woman and served my Master and Paramour that I knew love utterly.

412. To commit adultery with God is the perfect experience for which the world was created.

413. To fear God really is to remove oneself to a distance from Him, but to fear Him in play gives an edge to utter delightfulness.
414. The Jew invented the God-fearing man; India the God-
knower and God-lover.

415. The servant of God was born in Judaea, but he came to
maturity among the Arabs. India’s joy is in the servant-lover.

416. Perfect love casts out fear; but still keep thou some tender
shadow and memory of the exile and it will make the perfection
more perfect.

417. Thy soul has not tasted God’s entire delight, if it has
never had the joy of being His enemy, opposing His designs
and engaging with Him in mortal combat.

418. If you cannot make God love you, make Him fight you. If
He will not give you the embrace of the lover, compel Him to
give you the embrace of the wrestler.

419. My soul is the captive of God, taken by Him in battle; it
still remembers the war, though so far from it, with delight and
alarm and wonder.

420. Most of all things on earth I hated pain till God hurt
and tortured me; then it was revealed to me that pain is only a
perverse and recalcitrant shape of excessive delight.

421. There are four stages in the pain God gives to us; when it
is only pain; when it is pain that causes pleasure; when it is pain
that is pleasure; and when it is purely a fiercer form of delight.

422. Even when one has climbed up into those levels of bliss
where pain vanishes, it still survives disguised as intolerable
ecstasy.

423. When I was mounting upon ever higher crests of His joy, I
asked myself whether there was no limit to the increase of bliss
and almost I grew afraid of God’s embraces.
424. The next greatest rapture to the love of God, is the love of God in men; there, too, one has the joy of multiplicity.

425. For monogamy may be the best for the body, but the soul that loves God in men dwells here always as the boundless & ecstatic polygamist; yet all the time — that is the secret — it is in love with only one being.

426. The whole world is my seraglio and every living being and inanimate existence in it is the instrument of my rapture.

427. I did not know for some time whether I loved Krishna best or Kali; when I loved Kali, it was loving myself, but when I loved Krishna, I loved another, and still it was my Self with whom I was in love. Therefore I came to love Krishna better even than Kali.

428. What is the use of admiring Nature or worshipping her as a Power, a Presence and a goddess? What is the use, either, of appreciating her aesthetically or artistically? The secret is to enjoy her with the soul as one enjoys a woman with the body.

429. When one has the vision in the heart, everything, Nature and Thought and Action, ideas and occupations and tastes and objects become the Beloved and are a source of ecstasy.

430. The philosophers who reject the world as Maya, are very wise and austere and holy; but I cannot help thinking sometimes that they are also just a little stupid and allow God to cheat them too easily.

431. For my part, I think I have a right to insist on God giving Himself to me in the world as well as out of it. Why did He make it at all, if He wanted to escape that obligation?

432. The Mayavadin talks of my Personal God as a dream and prefers to dream of Impersonal Being; the Buddhist puts that
aside too as a fiction and prefers to dream of Nirvana and the bliss of nothingness. Thus all the dreamers are busy reviling each other's visions and parading their own as the panacea. What the soul utterly rejoices in, is for thought the ultimate reality.

433. Beyond Personality the Mayavadin sees indefinable Existence; I followed him there and found my Krishna beyond in indefinable Personality.

434. When I first met Krishna, I loved Him as a friend and playmate till He deceived me; then I was indignant and could not forgive Him. Afterwards I loved Him as a lover and He still deceived me; I was again and much more indignant, but this time I had to pardon.

435. After offending, He forced me to pardon Him not by reparation, but by committing fresh offences.

436. So long as God tried to repair His offences against me, we went on periodically quarrelling; but when He found out His mistake, the quarrelling stopped, for I had to submit to Him entirely.

437. When I saw others than Krishna and myself in the world, I kept secret God's doings with me; but since I began to see Him and myself everywhere, I have become shameless and garrulous.

438. All that my Lover has, belongs to me. Why do you abuse me for showing off the ornaments He has given to me?

439. My Lover took His crown and royal necklace from His head and neck and clothed me with them; but the disciples of the saints and the prophets abused me and said, “He is hunting after siddhis.”

440. I did my Lover's commands in the world & the will of my Captor; but they cried, “Who is this corruptor of youth, this disturber of morals?”
441. If I cared even for your praise, O ye saints, if I cherished my reputation, O ye prophets, my Lover would never have taken me into His bosom and given me the freedom of His secret chambers.

442. I was intoxicated with the rapture of my Lover and I threw the robe of the world from me even in the world’s highways. Why should I care that the worldlings mock and the Pharisees turn their faces?

443. To thy lover, O Lord, the railing of the world is wild honey and the pelting of stones by the mob is summer rain on the body. For is it not Thou that railest and peltest, and is it not Thou in the stones that strikest and hurtest me?

444. There are two things in God which men call evil, that which they cannot understand at all and that which they misunderstand and, possessing, misuse; it is only what they grope after half-vainly and dimly understand that they call good and holy. But to me all things in Him are lovable.

445. They say, O my God, that I am mad because I see no fault in Thee; but if I am indeed mad with Thy love, I do not wish to recover my sanity.

446. “Errors, falsehoods, stumblings!” they cry. How bright and beautiful are Thy errors, O Lord! Thy falsehoods save Truth alive; by Thy stumblings the world is perfected.

447. Life, Life, Life, I hear the passions cry; God, God, God, is the soul’s answer. Unless thou seest and lovest Life as God only, then is Life itself a sealed joy to thee.

448. “He loves her”, the senses say; but the soul says “God God God”. That is the all-embracing formula of existence.

449. If thou canst not love the vilest worm and the foulest of
criminals, how canst thou believe that thou hast accepted God in thy spirit?

450. To love God, excluding the world, is to give Him an intense but imperfect adoration.

451. Is love only a daughter or handmaid of jealousy? If Krishna loves Chandrabali, why should I not love her also?

452. Because thou lovest God only, thou art apt to claim that He should love thee rather than others; but this is a false claim contrary to right & the nature of things. For He is the One but thou art of the many. Rather become one in heart & soul with all beings, then there will be none in the world but thou alone for Him to love.

453. My quarrel is with those who are foolish enough not to love my Lover, not with those who share His love with me.

454. In those whom God loves, have delight; on those whom He pretends not to love, take pity.

455. Dost thou hate the atheist because he does love not God? Then shouldst thou be disliked because thou dost not love God perfectly.

456. There is one thing especially in which creeds and churches surrender themselves to the devil, and that is in their anathemas. When the priest chants Anathema Maranatha, then I see a devil worshipper praying.

457. No doubt, when the priest curses, he is crying to God; but it is the God of anger and darkness to whom he devotes himself along with his enemy; for as he approaches God, so shall God receive him.

458. I was much plagued by Satan, until I found that it was
God who was tempting me; then the anguish of him passed out of my soul for ever.

459. I hated the devil and was sick with his temptations and tortures; and I could not tell why the voice in his departing words was so sweet that when he returned often and offered himself to me, it was with sorrow I refused him. Then I discovered it was Krishna at His tricks and my hate was changed into laughter.

460. They explained the evil in the world by saying that Satan had prevailed against God; but I think more proudly of my Beloved. I believe that nothing is done but by His will in heaven or hell, on earth or on the waters.

461. In our ignorance we are like children proud of our success in walking erect and unaided and too eager to be aware of the mother’s steadying touch on the shoulder. When we wake, we look back and see that God was leading and upholding us always.

462. At first whenever I fell back into sin, I used to weep and rage against myself and against God for having suffered it. Afterwards it was as much as I could dare to ask, “Why hast thou rolled me again in the mud, O my playfellow?” Then even that came to my mind to seem too bold and presumptuous; I could only get up in silence, look at him out of the corner of my eyes — and clean myself.

463. God has so arranged life that the world is the soul’s husband; Krishna its divine paramour. We owe a debt of service to the world and are bound to it by a law, a compelling opinion, and a common experience of pain and pleasure, but our heart’s worship and our free and secret joy are for our Lover.

464. The joy of God is secret and wonderful; it is a mystery and a rapture at which common sense makes mouths of mockery;
but the soul that has once tasted it, can never renounce, whatever worldly disrepute, torture and affliction it may bring us.

465. God, the world Guru, is wiser than thy mind; trust Him and not that eternal self-seeker & arrogant sceptic.

466. The sceptic mind doubts always because it cannot understand, but the faith of the God-lover persists in knowing although it cannot understand. Both are necessary to our darkness, but there can be no doubt which is the mightier. What I cannot understand now, I shall some day master, but if I lose faith & love, I fall utterly from the goal which God has set before me.

467. I may question God, my guide & teacher, & ask Him, “Am I right or hast Thou in thy love & wisdom suffered my mind to deceive me?” Doubt thy mind, if thou wilt, but doubt not that God leads thee.

468. Because thou wert given at first imperfect conceptions about God, now thou ragest and deniest Him. Man, dost thou doubt thy teacher because he gave not thee the whole of knowledge at the beginning? Study rather that imperfect truth & put it in its place, so that thou mayst pass on safely to the wider knowledge that is now opening before thee.

469. This is how God in His love teaches the child soul & the weakling, taking them step by step and withholding the vision of His ultimate & yet unattainable mountaintops. And have we not all some weakness? Are we not all in His sight but as little children?

470. This I have seen that whatever God has withheld from me, He withheld in His love & wisdom. Had I grasped it then, I would have turned some great good into a great poison. Yet sometimes when we insist, He gives us poison to drink that we
may learn to turn from it and taste with knowledge His ambrosia & His nectar.

471. Even the atheist ought now to be able to see that creation marches towards some infinite & mighty purpose which evolution in its very nature supposes. But infinite purpose & fulfilment presupposes an infinite wisdom that prepares, guides, shapes, protects & justifies. Revere then that Wisdom & worship it with thoughts in thy soul if not with incense in a temple, and even though thou deny it the heart of infinite Love and the mind of infinite self-effulgence. Then though thou know it not it is still Krishna whom thou reverest & worshippest.

472. The Lord of Love has said, “They who follow after the Unknowable & Indefinable, follow after Me and I accept them.” He has justified by His word the Illusionist & the Agnostic. Why then, O devotee, dost thou rail at him whom thy Master has accepted?

473. Calvin who justified eternal Hell, knew not God but made one terrible mask of Him His eternal reality. If there were an unending Hell, it could only be a seat of unending rapture; for God is Ananda and than the eternity of His bliss there is no other eternity.

474. Dante, when he said that God’s perfect love created eternal Hell, wrote perhaps wiselier than he knew; for from stray glimpses I have sometimes thought there is a Hell where our souls suffer aeons of intolerable ecstasy & wallow as if for ever in the utter embrace of Rudra, the sweet & terrible.

475. Discipleship to God the Teacher, sonship to God the Father, tenderness of God the Mother, clasp of the hand of the divine Friend, laughter and sport with our Comrade and boy Playfellow, blissful servitude to God the Master, rapturous love of our divine Paramour, these are the seven beatitudes of life in the human body. Canst thou unite all these in a single supreme &
rainbow-hued relation? Then hast thou no need of any heaven and thou exceedest the emancipation of the Adwaitin.

476. When will the world change into the model of heaven? When all mankind becomes boys & girls together with God revealed as Krishna & Kali, the happiest boy & strongest girl of the crowd, playing together in the gardens of Paradise. The Semitic Eden was well enough, but Adam & Eve were too grown up and its God himself too old & stern & solemn for the offer of the Serpent to be resisted.

477. The Semites have afflicted mankind with the conception of a God who is a stern & dignified king & solemn judge & knows not mirth. But we who have seen Krishna, know Him for a boy fond of play and a child full of mischief & happy laughter.

478. A God who cannot smile, could not have created this humorous universe.

479. God took a child to fondle him in His bosom of delight; but the mother wept & would not be consoled because her child no longer existed.

480. When I suffer from pain or grief or mischance, I say “So, my old Playfellow, thou hast taken again to bullying me,” and I sit down to possess the pleasure of the pain, the joy of the grief, the good fortune of the mischance; then He sees He is found out and takes His ghosts & bugbears away from me.

481. The seeker after divine knowledge finds in the description of Krishna stealing the robes of the Gopis one of the deepest parables of God’s ways with the soul, the devotee a perfect rendering in divine act of his heart’s mystic experiences, the prurient & the Puritan (two faces of one temperament) only a lustful story. Men bring what they have in themselves and see it reflected in the Scripture.
482. My lover took away my robe of sin and I let it fall, rejoicing; then he plucked at my robe of virtue, but I was ashamed and alarmed and prevented him. It was not till he wrested it from me by force that I saw how my soul had been hidden from me.

483. Sin is a trick & a disguise of Krishna to conceal Himself from the gaze of the virtuous. Behold, O Pharisee, God in the sinner, sin in thy self purifying thy heart; clasp thy brother.

484. Love of God, charity towards men is the first step towards perfect wisdom.

485. He who condemns failure & imperfection, is condemning God; he limits his own soul and cheats his own vision. Condemn not, but observe Nature, help & heal thy brothers and strengthen by sympathy their capacities & their courage.

486. Love of man, love of woman, love of things, love of thy neighbour, love of thy country, love of animals, love of humanity are all the love of God reflected in these living images. So love & grow mighty to enjoy all, to help all and to love for ever.

487. If there are things that absolutely refuse to be transformed or remedied into God’s more perfect image, they may be destroyed with tenderness in the heart, but ruthlessness in the smiting. But make sure first that God has given thee thy sword and thy mission.

488. I should love my neighbour not because he is neighbourhood, — for what is there in neighbourhood and distance? nor because the religions tell me he is my brother, — for where is the root of that brotherhood? but because he is myself. Neighbourhood and distance affect the body, the heart goes beyond them. Brotherhood is of blood or country or religion or humanity, but when self-interest clamours what becomes of this brotherhood? It is only by living in God & turning mind and heart & body
into the image of his universal unity that that deep, disinterested and unassailable love becomes possible.

489. When I live in Krishna, then ego & self-interest vanish and only God himself can qualify my love bottomless & illimitable.

490. Living in Krishna, even enmity becomes a play of love and the wrestling of brothers.

491. To the soul that has hold of the highest beatitude, life cannot be an evil or a sorrowful illusion; rather all life becomes the rippling love and laughter of a divine Lover & Playfellow.

492. Canst thou see God as the bodiless Infinite & yet love Him as a man loves his mistress? Then has the highest truth of the Infinite been revealed to thee. Canst thou also clothe the Infinite in one secret embraceable body and see Him seated in each & all of these bodies that are visible & sensible? Then has its widest & profoundest truth come also into thy possession.

493. Divine Love has simultaneously a double play, an universal movement, deep, calm & bottomless like the nether Ocean, which broods upon the whole world and each thing that is in it as upon a level bed with an equal pressure, and a personal movement, forceful, intense & ecstatic like the dancing surface of the same Ocean, which varies the height & force of its billows and chooses the objects it shall fall upon with the kiss of its foam & spray and the clasp of its engulfing waters.

494. I used to hate and avoid pain and resent its infliction; but now I find that had I not so suffered, I would not now possess, trained and perfected, this infinitely & multitudinously sensible capacity of delight in my mind, heart and body. God justifies himself in the end even when He has masked Himself as a bully and a tyrant.

495. I swore that I would not suffer from the world’s grief and the world’s stupidity and cruelty & injustice and I made my
heart as hard in endurance as the nether millstone and my mind
as a polished surface of steel. I no longer suffered, but enjoy-
ment had passed away from me. Then God broke my heart and
ploughed up my mind. I rose through cruel & incessant anguish
to a blissful painlessness and through sorrow and indignation
& revolt to an infinite knowledge and a settled peace.

496. When I found that pain was the reverse side & the training
of delight, I sought to heap blows on myself & multiply suffering
in all my members; for even God's tortures seemed to me slow
& slight & inefficient. Then my Lover had to stay my hand &
cry, “Cease; for my stripes are enough for thee.”

497. The self-torture of the old monks & penitents was perverse
& stupid; yet was there a secret soul of knowledge behind their
perversities.

498. God is our wise & perfect Friend; because he knows when
to smite as well as when to fondle, when to slay us no less than
when to save & to succour.

499. The divine Friend of all creatures conceals His friendliness
in the mask of an enemy till He has made us ready for the highest
heavens; then, as in Kurukshetra, the terrible form of the Master
of strife, suffering & destruction is withdrawn & the sweet face,
the tender arm, the oft-clasped body of Krishna shine out on the
shaken soul & purified eyes of his eternal comrade & playmate.

500. Suffering makes us capable of the full force of the Master
of Delight; it makes us capable also to bear the utter play of the
Master of Power. Pain is the key that opens the gates of strength;
it is the high-road that leads to the city of beatitude.

501. Yet, O soul of man, seek not after pain, for that is not His
will, seek after His joy only; as for suffering, it will come to thee
surely in His providence as often and as much as is needed for
thee. Then bear it that thou mayst find out at last its heart of rapture.

502. Neither do thou inflict pain, O man, on thy fellow; God alone has the right to inflict pain; or those have it whom He has commissioned. But deem not fanatically, as did Torquemada, that thou art one of these.

503. In former times there was a noble form of asseveration for souls compact merely of force and action, “As surely as God liveth.” But for our modern needs another asseveration would suit better, “As surely as God loveth.”

504. Science is chiefly useful to the God-lover & the God-knower because it enables him to understand in detail and admire the curious wonders of His material workmanship. The one learns & cries, “Behold how the Spirit has manifested itself in matter”; the other, “Behold, the touch of my Lover & Master, the perfect Artist, the hand omnipotent.”

505. O Aristophanes of the universe, thou who watchest thy world and laughest sweetly to thyself, wilt thou not let me too see with divine eyes and share in thy worldwide laughers?

506. Kalidasa says in a daring image that the snow-rocks of Kailasa are Shiva’s loud world-laugthers piled up in utter whiteness & pureness on the mountaintops. It is true; and when their image falls on the heart, then the world’s cares melt away like the clouds below into their real nothingness.

507. The strangest of the soul’s experiences is this, that it finds, when it ceases to care for the image & threat of troubles, then the troubles themselves are nowhere to be found in one’s neighbourhood. It is then that we hear from behind those unreal clouds God laughing at us.

508. Has thy effort succeeded, O thou Titan? Dost thou sit, like Ravana and Hiranyakashipou, served by the gods and the
world’s master? But that which thy soul was really hunting after, has escaped from thee.

509. Ravana’s mind thought it was hungering after universal sovereignty and victory over Rama; but the aim his soul kept its vision fixed upon all the time was to get back to its heaven as soon as possible & be again God’s menial. Therefore, as the shortest way, it hurled itself against God in a furious clasp of enmity.

510. The greatest of joys is to be, like Naraka, the slave of God; the worst of Hells, being abandoned of God, to be the world’s master. That which seems nearest to the ignorant conception of God, is the farthest from him.

511. God’s servant is something; God’s slave is greater.

512. To be master of the world would indeed be supreme felicity, if one were universally loved; but for that one would have to be at the same time the slave of all humanity.

513. After all when thou countest up thy long service to God, thou wilt find thy supreme work was the flawed & little good thou didst in love for humanity.

514. There are two works that are perfectly pleasing to God in his servant; to sweep in silent adoration His temple-floors and to fight in the world’s battlefield for His divine consummation in humanity.

515. He who has done even a little good to human beings, though he be the worst of sinners, is accepted by God in the ranks of His lovers and servants. He shall look upon the face of the Eternal.

516. O fool of thy weakness, cover not God’s face from thyself by a veil of awe, approach Him not with a suppliant weakness.
Look! thou wilt see on His face not the solemnity of the King & Judge, but the smile of the Lover.

517. Until thou canst learn to grapple with God as a wrestler with his comrade, thy soul’s strength shall always be hid from thee.

518. Sumbha first loved Kali with his heart & body, then was furious with her and fought her, at last prevailed against her, seized her by the hair & whirled her thrice round him in the heavens; the next moment he was slain by her. These are the Titan’s four strides to immortality and of them all the last is the longest and mightiest.

519. Kali is Krishna revealed as dreadful Power & wrathful Love. She slays with her furious blows the self in body, life & mind in order to liberate it as spirit eternal.

520. Our parents fell, in the deep Semitic apologue, because they tasted the fruit of the tree of good and evil. Had they taken at once of the tree of eternal life, they would have escaped the immediate consequence; but God’s purpose in humanity would have been defeated. His wrath is our eternal advantage.

521. If Hell were possible, it would be the shortest cut to the highest heaven. For verily God loveth.

522. God drives us out [of] every Eden that we may be forced to travel through the desert to a diviner Paradise. If thou wonder why should that parched & fierce transit be necessary, then art thou befooled by thy mind and hast not studied thy soul behind and its dim desires and secret raptures.

523. A healthy mind hates pain; for the desire of pain that men sometimes develop in their minds is morbid and contrary to Nature. But the soul cares not for the mind & its sufferings any more than the iron-master for the pain of the ore in the furnace; it follows its own necessities and its own hunger.
524. Pity is sometimes a good substitute for love; but it is always no more than a substitute.

525. Self-pity is always born of self-love; but pity for others is not always born of love for its object. It is sometimes a self-regarding shrinking from the sight of pain; sometimes the rich man’s contemptuous dole to the pauper. Develop rather God’s divine compassion than human pity.

526. Not pity that bites the heart and weakens the inner members, but a divine masterful & untroubled compassion and helpfulness is the virtue that we should encourage.

527. To find that saving a man’s body or mind from suffering is not always for the good of either soul, mind or body, is one of the bitterest of experiences for the humanly compassionate.

528. Human pity is born of ignorance & weakness; it is the slave of emotional impressions. Divine compassion understands, discerns & saves.

529. Indiscriminate compassion is the noblest gift of temperament, not to do even the least hurt to one living thing is the highest of all human virtues; but God practises neither. Is man therefore nobler and better than the All-loving?

530. Love and serve men, but beware lest thou desire their approbation. Obey rather God within thee.

531. Not to have heard the voice of God and His angels is the world’s idea of sanity.

532. See God everywhere and be not frightened by masks. Believe that all falsehood is truth in the making or truth in the breaking, all failure an effectuality concealed, all weakness strength hiding itself from its own vision, all pain a secret & violent ecstasy. If thou believest firmly & unweariedly, in the end thou wilt see & experience the All-true, Almighty & All-blissful.
533. Human love fails by its own ecstasy, human strength is exhausted by its own effort, human knowledge throws a shadow that conceals half the globe of truth from its own sunlight; but divine knowledge embraces opposite truths & reconciles them, divine strength grows by the prodigality of its self-expenditure, divine love can squander itself utterly, yet never waste or diminish.

534. The rejection of falsehood by the mind seeking after truth is one of the chief causes why mind cannot attain to the settled, rounded & perfect truth; not to escape falsehood is the effort of divine mind, but to seize the truth which lies masked behind even the most grotesque or far-wandering error.

535. The whole truth about any object is a rounded & all-embracing globe which for ever circles around, but never touches the one & only subject & object of knowledge, God.

536. There are many profound truths which are like weapons dangerous to the unpractised wielder. Rightly handled, they are the most precious & potent in God's armoury.

537. The obstinate pertinacity with which we cling to our meagre, fragmentary, night-besieged & grief-besieged individual existence even while the unbroken bliss of our universal life calls to us, is one of the most amazing of God's mysteries. It is only equalled by the infinite blindness with which we cast a shadow of our ego over the whole world & call that the universal being. These two darknesses are the very essence & potency of Maya.

538. Atheism is the shadow or dark side of the highest perception of God. Every formula we frame about God, though always true as a symbol, becomes false when we accept it as a sufficient formula. The Atheist & Agnostic come to remind us of our error.

539. God's negations are as useful to us as His affirmations. It is He who as the Atheist denies His own existence for the better
perfecting of human knowledge. It is not enough to see God in Christ & Ramakrishna & hear His words, we must see Him and hear Him also in Huxley & Haeckel.

540. Canst thou see God in thy torturer & slayer even in thy moment of death or thy hours of torture? Canst thou see Him in that which thou art slaying, see & love even while thou slayest? Thou hast thy hand on the supreme knowledge. How shall he attain to Krishna who has never worshipped Kali?
Additional Aphorisms

541. I know that the opposite of what I say is true, but for the present what I say is still truer.

542. I believe with you, my friends, that God, if He exists, is a demon and an ogre. But after all what are you going to do about it?

543. God is the supreme Jesuit Father. He is ever doing evil that good may come of it; ever misleads for a greater leading; ever oppresses our will that it may arrive at last at an infinite freedom.

544. Our Evil is to God not evil, but ignorance and imperfection, our good a lesser imperfection.

545. The religionist speaks a truth, though too violently, when he tells us that even our greatest and purest virtue is as vileness before the divine nature of God.

546. To be beyond good and evil is not to act sin or virtue indifferently, but to arrive at a high and universal good.

547. That good is not our ethical virtue which is a relative and erring light in the world; it is supra-ethical and divine.
Note on the Texts
Note on the Texts

ESSAYS DIVINE AND HUMAN consists of short prose pieces written by Sri Aurobindo between 1910 and the late 1940s and not published before his passing in 1950. Most prose works written prior to 1910 on subjects other than politics are published in Early Cultural Writings, volume 1 of THE COMPLETE WORKS OF SRI AUROBINDO. Most short prose works written after 1910 and published during his lifetime are included in Essays in Philosophy and Yoga, volume 13 of THE COMPLETE WORKS. Short writings on the Vedas, the Upanishads and other specialised subjects are included in the volumes devoted to those subjects. Most of the writings in the present volume deal with philosophy, yoga, and yogic psychology. The contents have been divided into four parts:

Part One. Essays Divine and Human. More or less complete essays, most of which were given titles and revised to some extent by the author. They have been grouped by period in five sections.

Part Two. From Man to Superman. Notes, drafts and fragments on yoga and yogic philosophy and psychology. Few of these pieces were revised; most are incomplete, several quite fragmentary. The editors have arranged them by subject on lines explained below.

Part Three. Notes and Fragments on Various Subjects. Miscellaneous pieces that received little or no revision by the author. They differ from the pieces in Part Two in dealing with subjects not directly related to yoga, philosophy or psychology.

Part Four. Thoughts and Aphorisms. A series of aphorisms, revised but never prepared for publication by the author.

PART ONE: ESSAYS DIVINE AND HUMAN

The pieces in this part have been arranged by the editors in five chronological sections. Many of the sections or subsections correspond to organic divisions in the author’s work.
Section One (circa 1911)

All but the first piece in this section were written in a single notebook, probably in 1911. “Certitudes” belongs roughly to the same period. Above “Man” Sri Aurobindo wrote a collective title: “Essays — ”.

Certitudes. Circa 1911–13. The Sanskrit phrase at the end, a citation from the Bhagavad Gita (4.11), means “as men approach me, so I accept them to my love”.

Moksha. Circa 1911.

Man. Circa 1911. The Sanskrit phrase in the second paragraph, an altered citation from the Aitareya Upanishad (I.2.3), means “well-built, indeed”.

Philosophy. Circa 1911.

The Siddhis. Circa 1911.

The Psychology of Yoga. Circa 1911. Sri Aurobindo used this title again for a piece in Section Two that was written independently a year or two later and yet again as the general title of the first group of essays in Section Three.

Section Two (1910–1913)

Manuscripts of six of these essays — “The Sources of Poetry”, “The Interpretation of Scripture”, “On Original Thinking”, “The Balance of Justice”, “Social Reform” and “The Claims of Theosophy” — were typed in or around 1912 using the same typewriter and the same sort of paper. The other seven essays are related to the typed ones by subject or date or both.

Na Kinchidapi Chintayet. Possibly early 1910. The title is a quotation from the Bhagavad Gita (6.25): “One should not think of anything at all.”

The Sources of Poetry. Circa 1912.

The Interpretation of Scripture. Circa 1912.

On Original Thinking. Circa 1912. After the text of the principal version, the editors have placed the draft opening of another version, entitled in the manuscript “On the Importance of Original Thinking”. Above this title Sri Aurobindo wrote: “Essays — Human and Divine”.

www.holybooks.com
The editors have used a variant of this (see “The Silence behind Life” below) as the title of this part and of the volume as a whole.

The Balance of Justice. Circa 1912. This is a revised and enlarged version of “European Justice” (published in Early Cultural Writings), which probably was written in 1910.

Social Reform. Circa 1912. The first nine paragraphs were typewritten. Sri Aurobindo subsequently added five handwritten paragraphs to the last typed sheet. (These paragraphs are difficult to read and parts have been lost through mutilation of the manuscript.) The passage beginning “We are Hindus” was written separately and headed “For ‘Social Reform’”. Sri Aurobindo left no indication where he wanted it inserted. The editors have placed it at the end, separating it from the main text by a white space.

Hinduism and the Mission of India. Circa 1912. Editorial title. The first pages of the manuscript have been lost; the first surviving sentence lacks its beginning.

The Psychology of Yoga (regarding the title, see the note on “The Psychology of Yoga” in Section One). Circa 1912 (written around the same time as the pieces on Theosophy that follow).

The Claims of Theosophy. Circa 1910–12 (certainly written after January 1908, when Sri Aurobindo met V. B. Lele, the “member of the Theosophical Society who [gave] me spiritual help” mentioned in paragraph six). This article, like the others on Theosophy, was never published by Sri Aurobindo. However much he disagreed with some of the methods or doctrines of the Theosophical Society, he was well aware of the pioneering work done by this movement, which “with its comprehensive combinations of old and new beliefs and its appeal to ancient spiritual and psychic systems, has everywhere exercised an influence far beyond the circle of its professed adherents” (The Renaissance in India, CWSA vol. 20, p. 70). He assured a disciple who had been associated with the Theosophists: “I have nothing against it [the Theosophical Society] nor against any of the Theosophists, to all of whom I wish the best. I am not against them” (Talk with a disciple, 11 January 1926). Science & Religion in Theosophy. Circa 1910–12. Heading in the manuscript: “Papers on Theosophy/II/Science & Religion in Theosophy”. (Although not so identified, “The Claims of Theosophy” evidently is the first of the papers.)
The essays in this section form three groups, which were written in three notebooks in or around 1913. The titles of the first and third groups were given by Sri Aurobindo.

The Psychology of Yoga. Sri Aurobindo wrote this title inside the cover of the notebook used. On the front of the cover he wrote, and then cancelled, “Hints on Yoga”.

Initial Definitions and Descriptions. Circa 1913. Before the first paragraph Sri Aurobindo wrote the numeral “1”.

The Object of Our Yoga. Circa 1913. This essay is found in the notebook containing the pieces that make up the next group, but seems to go better here. It has no title in the manuscript.

Purna Yoga. Editorial title. The three pieces are headed I, II, III in the manuscript.

I. The Entire Purpose of Yoga. Circa 1913.
II. Parabrahman, Mukti & Human Thought-Systems. Circa 1913.

Natural and Supernatural Man. This title is written on the cover of the notebook that contains all the pieces in this group.

The Evolutionary Aim in Yoga. Circa 1913.

The Fullness of Yoga — In Condition. Circa 1913. A draft of this and the preceding essay is published as piece 127 of Part Two. The second part of the draft, from the phrase “Yoga in its practice may be either perfect or partial” to the end, was rewritten as “The Fullness of Yoga — In Condition”. This essay follows the draft rather closely for two and a half paragraphs; from this point the two are developed on different lines. The significance of the phrase “in condition” in the title is not made clear in the essay; but it is brought out sufficiently well in the draft.
Note on the Texts

**Nature.** Circa 1913. This essay was at one point to be entitled “Maya, Lila, Prakriti, Chit-Shakti”. Individual pieces on each of these aspects of the force called Nature were apparently planned, but only “Maya” was written.

**Maya.** Circa 1913. In the second paragraph Sri Aurobindo writes of his intention to “look at the Cosmos from . . . the standpoint . . . of . . . Lila”. Although never able to complete an essay on this theme, he did sketch his view of the subject in two sentences written on the back cover of the notebook. These sentences are given as a footnote.

**Section Four (1914–1919)**

The four essays making up this section were written independently during the period of publication of the monthly journal *Arya* (1914–21). They may have been meant for the journal, but were not published there. They have no relationship with each other except that of date.

**The Beginning and the End.** Circa 1915. Editorial title. In the manuscript this passage is followed by one that was published in the *Arya* in May 1915 under the title “Thoughts and Glimpses”. Subsequently this second passage was reproduced as three parts of the booklet *Thoughts and Glimpses* (published in *Essays in Philosophy and Yoga*).

**The Hour of God.** Circa 1918.

**Beyond Good and Evil.** Circa 1918. Editorial title.

**The Divine Superman.** Circa 1918.

**Section Five (1927 and after)**

The second, third and fourth essays in this section were written in the same notebook around 1930. The other two were written at roughly the same time.

**The Law of the Way.** Circa 1927. The manuscript is untitled; the editors have used a phrase from the last sentence as heading.

**Man and the Supermind.** Circa 1930. Sri Aurobindo returned to the theme “Man is a transitional being” again and again. See pieces 46,
47, 53, 54, 77, 80, 81 and 82 of Part Two. The present essay is the last of several drafts.

The Involved and Evolving Godhead. Circa 1930. Written immediately after the preceding essay in the same notebook. An earlier draft, written around 1927, is published as piece 51 of Part Two.

The Evolution of Consciousness. Circa 1930. Untitled in the manuscript. The Greek sentence at the end of the third paragraph means “God is not but becomes.”

The Path. Circa 1930. This essay is one of several pieces written around 1930 on the supramental yoga. Three others are published as pieces 18, 157 and 159 of Part Two.

**PART TWO: FROM MAN TO SUPERMAN**

The 171 notes, drafts and fragments that make up this part were written by Sri Aurobindo over the course of thirty-five years, from around 1912 to 1947, when failing eyesight obliged him to stop writing by hand.

None of the pieces were revised for publication by the author. It has sometimes been necessary for the editors to make judgments as to what his intentions were. In addition, some of the pieces, particularly those from the 1940s, are quite difficult to read. The editors have been able to decipher all but a few words; doubtful readings and illegible words are indicated in accordance with the Guide to Editorial Notation. Special problems are discussed in the reference volume.

These 171 pieces were never intended to form a single work. The compilation, arrangement and numbering is the responsibility of the editors. They have chosen to arrange the pieces by subject rather than date because a strict chronological arrangement, even if possible, would have resulted in thematic incoherence. A table in the reference volume shows the approximate chronological sequence of the pieces.

The material falls into three broad categories, which have been made the main sections of the compilation: philosophy (the principles of things), psychology (the study of consciousness), and yoga. The pieces in each section have been divided into subsections and sub-subsections.

A number of the pieces have headings in the manuscript. Some
apparently were intended to be the titles of the essays or books that the pieces would have introduced. Since Sri Aurobindo frequently abandoned the pieces before the subject given in the title was reached, all headings have been omitted from the texts. They are given in the notes on individual pieces below. Some headings have been made the titles of subdivisions. One heading used twice by Sri Aurobindo, “From Man to Superman”, has been used as the title of this part.

Sri Aurobindo usually placed some sort of sign (asterisk, group of asterisks, bar, etc.) to mark his own division of pieces into sections. The editors have represented his sign uniformly by a single asterisk.

Notes on Individual Pieces in Part Two

1. Circa 1927. Heading: “God, Nature and Man” (used as the subtitle of this section; cf. the heading of piece 14). The text of the piece is cancelled in the manuscript.
2. Circa 1936.
3. Late 1920s to early 1930s. Heading: “The Divine”.
4. Late 1920s to early 1930s.
5. Circa 1912. Heading: “Ishavasyam”. On the next two pages of the same notebook is written a fragmentary commentary on the Isha Upanishad. The present piece clearly is related to that commentary.
6. Arya period (1914–21).
8. Late 1920s to early 1930s. Pieces 8–15 are fragmentary treatments of a theme taken up by Sri Aurobindo recurrently over a period of ten to twenty years. Pieces 8–11 all were written in the same notebook. Cf. also piece 55 and piece 128.
9. Late 1920s to early 1930s.
10. Late 1920s to early 1930s.
11. Late 1920s to early 1930s.
12. Circa 1942. The phrase “Ekam evadvitiyam” was written at the end of the first paragraph, then cancelled.
13. 1930s.
15. 1930s.
17. Circa 1927. This piece was not included in the 1994 edition of Essays Divine and Human.
19. Circa 1927. The piece clearly is a fragment.
20. 17 June 1914. Heading: “The Tablet of Vedanta.” The opening sentence was written above the title in the manuscript, evidently after some or all of the rest had been written.
21. 1930s.
22. Circa 1913.
23. Circa 1942. Heading: “Note on a criticism in the Modern Review”. Written in or shortly after August 1942, when The Modern Review (Calcutta) published an adverse review of a Sanskrit-Bengali edition of the Gita edited by Anilbaran Roy, a disciple of Sri Aurobindo. The reviewer charged that the Sanskrit phrase parā práktir jīvabhūtā (cf. Gita 7.5), translated by Anilbaran according to Sri Aurobindo’s interpretation as presented in Essays on the Gita (see CWSA vol. 19, pp. 266, 269 and 519), could not bear the meaning given it, viz., the supreme Nature which has become the jīva (individual soul). Sri Aurobindo never published his note. His disciple Kapali Shastri answered the reviewer from a purely grammatical point of view in an article published in the Sri Aurobindo Mandir Annual of 1943 (no. 2, pp. 236–42).
25. Late 1920s to early 1930s. Headed “(2)”; the unmarked “(1)” presumably is one of the “Ekam evadvitiyam” pieces written in the same notebook (cf. pieces 8–11), probably piece 10. Cf. also piece 92.
27. June 1914 (probably between 3 and 17 June).
29. Circa 1927. This piece is the third of three drafts, written within a short time of one another, of the opening of the revised version of The Synthesis of Yoga, Part I, Chapter 11. The first of
these drafts bears an obvious relation to the printed version, the second an obvious relation to the first, and the third to the second; but almost nothing of the third draft appears in the printed version. It has therefore been printed here as a separate piece.

30. Early 1913.
32. Circa 1942. In the manuscript this piece comes after a passage consisting of quotations from a book dealing with Bergson’s “philosophy of change”, and two sentences written by Sri Aurobindo that are reproduced as piece 71.
33. Late 1920s to early 1930s. Written at the top of a page used otherwise for what is printed as the second footnote to piece 56. The present piece seems to have some textual relation to pieces 56 and 57.
34. *Arya* period (1914–21). The edge of the manuscript is damaged and several words partly or wholly lost. The piece may have been intended for the *Arya*, but was never published there.
37. Middle to late 1940s.
38. Circa 1929.
40. Circa 1942.
41. Circa 1929.
42. Circa 1918. Possibly intended for the *Arya*, perhaps as part of a chapter of *The Life Divine*, but not used even in a modified form in any *Arya* article.
43. Middle to late 1940s. The piece is the second section of a fragment headed “Man and Superman”; the first section is printed as piece 80. In the manuscript three asterisks divide the two sections; the editors have treated them as separate pieces.
44. Circa 1927. The manuscript of the piece occurs amid drafts of “Man and the Supermind” (Part One, Section Five).
45. Circa 1927.
46. Late 1920s to early 1930s.
47. Circa 1947. Heading: “From Man to Superman” (used as the title of this part, cf. piece 53).
50. 1930s.
51. Circa 1927. The piece is a partial draft of “The Involved and Evolving Godhead” (Part One, Section Five).
52. Circa 1942.
53. Middle to late 1940s. Heading: “From Man to Superman/I” (used as the title of this part, cf. piece 47).
54. Middle to late 1940s. Heading: “Superman”.
56. Late 1920s to early 1930s.
57. Late 1920s to early 1930s.
58. Late 1920s to early 1930s.
59. Circa 1927.
60. Middle to late 1940s. Heading: “Mat[t]er”.
63. Circa 1927.
64. Circa 1927.
65. 1930s, probably 1934.
66. Circa 1927. Written as part of a draft of “Man and the Supermind” (Part One, Section Five).
67. Circa 1927.
68. Circa 1927.
69. Late 1920s to early 1930s.
70. Circa 1927.
71. Circa 1942. Written below the quotations from a book on Bergson mentioned in the note to piece 32. The present piece is headed by the numeral 2, which separates it from the notes. Unlike the notes, the piece is not enclosed in inverted commas and so has been considered to be a writing of Sri Aurobindo’s.
72. Late 1930s to early 1940s. Heading: “Intuition”.

76. Arya period (1914–21), probably towards the end of the period. Pieces 76–82, as well as pieces 46, 47 and 53 are treatments of a single theme taken up by Sri Aurobindo recurrently over a period of more than twenty-five years (or thirty-five if Aphorism 162 in Part Four is taken into consideration). Pieces 64, 66 and 68 are on a related theme. Sri Aurobindo’s most complete essay on the subject is “Man and the Supermind” (Part One, Section Five).

80. Middle to late 1940s. Heading: “Man and Superman”. This piece was written along with what is published as piece 43.

82. 1940–42.

83. 1940–42.

84. 1940–42.

85. Late 1930s to early 1940s. Heading: “Consciousness”.

86. Middle to late 1940s. Heading: “Is Consciousness Real”.

87. 1940–42.

88. Late 1930s to early 1940s.

89. Circa 1927. Heading “Prolegomena”.

90. Circa 1937.

91. Middle to late 1940s.

92. Late 1920s to early 1930s.

93. Late 1920s to early 1930s. The piece is the incomplete second part of an untitled essay, the first part of which is published as “The Evolution of Consciousness” (Part One, Section Five). Sri Aurobindo abandoned the piece without examining the question from the second of the two “vision-bases” spoken of in the first sentence.

94. Middle to late 1940s. Heading: “The Conscient in unconscious things”.

95. Middle to late 1940s (written immediately after piece 94). Heading: “The Consciousness below the Surface”.

96. Middle to late 1940s.

97. Middle to late 1940s.
98. Circa 1942. Heading: “1 The Inconscient Energy”.
100. 1940–42.
102. Circa 1917–18. A half-page blank separates the present piece from piece 103. Heading: “Psychological Maxims”.
103. Circa 1917–18. A half-page blank separates the present piece from piece 104.
104. Circa 1917–18.
105. Early 1917. Heading: “The Psychology of Social Development / VII”; this is the title under which the book later published as The Human Cycle appeared in the Arya; the seventh instalment of the work, unrelated to the present piece, was published in the issue of February 1917.
107. 1912–13. Faces piece 106 in the manuscript.
109. Late 1940s. Heading: “The Psychology of Integral Yoga”.
110. Circa 1942. Heading: “Notes on Consciousness”; the piece is preceded by “1.” (no further notes were written).
111. 1 September 1947. Heading: “Consciousness”.
112. Circa 1936.
113. 1930s.
115. Late 1940s.
116. Middle to late 1940s.
117. Late 1920s to early 1930s.
118. Late 1920s to early 1930s.
120. Circa 1930.
121. Circa 1917–18.
122. Circa 1913.
124. Circa 1913. Heading: “The Evolutionary Aim of Yoga.” The piece apparently is related to “The Evolutionary Aim in Yoga” (Part One, Section Three), and so to piece 127.
125. 1930s.

127. Circa 1913. This long piece can be considered a draft of what, differently developed, became two essays, “The Evolutionary Aim in Yoga” and “The Fullness of Yoga — In Condition” (Part One, Section Three). The sense of the second of these titles is explained better in the last two paragraphs of the present piece than in the revised essay.

128. Late 1920s to early 1930s.

130. Circa 1915.

131. Circa 1927.

132. 1930s.

133. Circa 1927.

134. Circa 1928–29. This piece and piece 135 were written in the same notebook; it is possible that they are passages intended for insertion in a larger work, perhaps the revised version of The Synthesis of Yoga. (Note, in the first sentence of both pieces, the antecedentless “this”.)

136. Middle to late 1940s. Heading: “Yoga of Devotion”.

138. 1930s.

140. Circa 1927.

141. Circa 1927.

142. Circa 1927. The manuscript of this piece comes between two drafts of “The Law of the Way” (Part One, Section Five), and parts of the present piece are reminiscent of that essay.

143. Circa 1927.

144. Circa 1912.

145. Circa 1938.

146. Late 1920s to early 1930s.

147. 1930s. Pieces 147–51 were written in this order in a single notebook.

148. 1930s.

149. 1930s.
150. 1930s.
151. 1930s. This piece includes what was published as piece 17 in the 1994 edition of Essays Divine and Human.
153. Circa 1913. The piece breaks off abruptly; it is likely that Sri Aurobindo intended to write about more than two aims of the sadhana (cf. piece 154).
155. Circa 1930.
156. Late 1930s to early 1940s.
158. Circa 1930.
159. Circa 1930. Heading: “The Path”. This piece is the first draft of what is published in Part One, Section Five as “The Path” (the heading of the present piece is used as the title of that essay).
163. 1930s. The piece evidently is incomplete; only one of the four elements mentioned in the first paragraph was taken up.
164. Late 1930s to early 1940s. The piece evidently is incomplete; only one of the three transformations mentioned was taken up.
165. Late 1920s to early 1930s.
166. Late 1930s to early 1940s.
168. Circa 1927.
169. Circa 1927.
170. Circa 1927. These lines were written (and later bracketed) at the top of an incomplete draft of what is published in Part One, Section Five as “The Law of the Way”.

PART THREE: NOTES AND FRAGMENTS ON VARIOUS SUBJECTS

The pieces in this part were written between 1910 and the late 1940s. They have been arranged by subject.

A Cyclical Theory of Evolution. 1910–13. This piece probably was written around the same time as the preceding one. The opening page or pages (and so also the title) are missing.

A Misunderstanding of Continents. Circa 1918.

Towards Unification. Circa 1912. In the manuscript written beneath the heading: “Studies in the Mahabharat — / The Book of the Woman.” Evidently the passage printed here was meant to be an introduction to a discussion of the eleventh book of the Mahabharata, the *Stri-Parva* or Book of the Woman. Sri Aurobindo broke off work on the piece without reaching the proposed subject. The title has been supplied by the editors.

China, Japan and India. Circa 1912.

Renascent India. 1916–18. Editorial title.

Where We Stand in Literature. Circa 1916–18. Draft B was written after Draft A in the same notebook.

Poetic Genius. Circa 1912. Editorial title. In the manuscript the heading is “The Genius of Valmekie” (see the next piece).

The Voices of the Poets. Circa 1912. Editorial title. The text of this piece, like the preceding one, was written under the heading “The Genius of Valmekie”. There is no explicit mention of Valmiki in either piece.

Pensées. Circa 1912.

Reason and Society. Late 1930s or 1940s. Editorial title. The piece seems to be related to *The Human Cycle*. Published here for the first time.

Justice. Late 1940s. Editorial title.
Thoughts and Aphorisms. In or around 1913, Sri Aurobindo wrote 552 aphorisms in a single notebook. In May 1915 and May 1916 he published ten of them in the monthly review *Arya*. (These ten have not been reproduced here. They form part of *Thoughts and Glimpses*, included in *Essays in Philosophy and Yoga*.) Of the 542 aphorisms that remain, two have been classed with the “Additional Aphorisms” (see below). This leaves 540 aphorisms forming the main series of *Thoughts and Aphorisms*.

In the notebook, the aphorisms were written in nine groupings, three of which are headed Jnana, three Karma and three Bhakti. The groupings occur in this order: Jnana, Karma, Bhakti, Karma, Jnana, Bhakti, Karma, Bhakti, Jnana. The editors have placed the three groupings of Jnana, the three groupings of Karma and the three groupings of Bhakti together. Sri Aurobindo numbered all the aphorisms in Jnana and Karma, none of those in Bhakti. Since it appears that he intended the numbers to form part of the text, the editors have placed a number before each aphorism. These numbers do not correspond to those in the manuscript because the three groupings of each section have been placed together and the unnumbered Bhakti section included.

Sri Aurobindo left indications in the manuscript that certain aphorisms were to be moved to a different part or position. For example, he seems to have wanted present aphorisms 240 and 241 to be placed after present aphorism 98. But since some of these manuscript indications are not clear, the editors have followed the original notebook order.

The manuscript, entirely handwritten, was revised once or twice by Sri Aurobindo. The original writing is mostly clear, but the revision is sometimes cramped and difficult to read.

“Additional Aphorisms”. The last two aphorisms (541–42) in the notebook containing the main series were not clearly intended for inclusion in the Karma, Jnana or Bhakti sections. The editors have placed them in a separate section along with five other aphorisms (543–47) that were written in a different notebook. The handwriting of these last five indicates that they were written somewhat later than 1913 — possibly as late as 1919.
Note on the Texts

Publishing History

Some of the material published in this volume was brought out in The Hour of God (Pondicherry, Sri Aurobindo Ashram) in 1959. This booklet was reprinted in 1964, 1970 and 1973. In 1982 a new, re-organised edition was published. This was reprinted in 1986, 1991 and 1993.

Thoughts and Aphorisms was first published by the Sri Aurobindo Ashram in 1958. A second impression of the first edition was issued the next year. New editions textually identical to the first came out in 1968 and 1971. The texts of the fourth (1977) and fifth (1982) editions each contained corrections of transcription errors. The fifth edition was reprinted in 1988, 1992 and 1996.

In 1971 the contents of the original edition of The Hour of God, along with Thoughts and Aphorisms and other material, were brought out as The Hour of God and Other Writings, volume 17 of the Sri Aurobindo Birth Centenary Library.

In 1994 those parts of The Hour of God and Other Writings that had not been published during Sri Aurobindo’s lifetime, along with other material of the same nature that had not yet been published in a book, were brought out as Essays Divine and Human. The texts of all the pieces were checked against the manuscripts. The present volume is for the most part a reprint of that edition.
Essays in Philosophy and Yoga

Shorter Works

1910–1950
Publisher’s Note

*Essays in Philosophy and Yoga* consists of short works in prose written by Sri Aurobindo between 1909 and 1950 and published during his lifetime. All but a few of them are concerned with aspects of spiritual philosophy, yoga, and related subjects. Short writings on the Veda, the Upanishads, Indian culture, political theory, education, and poetics have been placed in other volumes.

The title of the volume has been provided by the editors. It is adapted from the title of a proposed collection, “Essays in Yoga”, found in two of Sri Aurobindo’s notebooks. Since 1971 most of the contents of the volume have appeared under the editorial title *The Supramental Manifestation and Other Writings*.

Many of the essays in Part Three were revised slightly by the author and published in small books between 1920 and 1941. The editors have retained the titles and arrangement of most of those books.

The texts of the pieces have been checked against the texts published in journals and books during Sri Aurobindo’s lifetime.

Essays from the *Karmayogin*

1909–1910
Sri Aurobindo in Pondicherry

www.holybooks.com
The Ideal of the Karmayogin

A NATION is building in India today before the eyes of the world so swiftly, so palpably that all can watch the process and those who have sympathy and intuition distinguish the forces at work, the materials in use, the lines of the divine architecture. This nation is not a new race raw from the workshop of Nature or created by modern circumstances. One of the oldest races and greatest civilisations on this earth, the most indomitable in vitality, the most fecund in greatness, the deepest in life, the most wonderful in potentiality, after taking into itself numerous sources of strength from foreign strains of blood and other types of human civilisation, is now seeking to lift itself for good into an organised national unity. Formerly a congeries of kindred nations with a single life and a single culture, always by the law of this essential oneness tending to unity, always by its excess of fecundity engendering fresh diversities and divisions, it has never yet been able to overcome permanently the almost insuperable obstacles to the organisation of a continent. The time has now come when those obstacles can be overcome. The attempt which our race has been making throughout its long history, it will now make under entirely new circumstances. A keen observer would predict its success because the only important obstacles have been or are in the process of being removed. But we go farther and believe that it is sure to succeed because the freedom, unity and greatness of India have now become necessary to the world. This is the faith in which the Karmayogin puts its hand to the work and will persist in it, refusing to be discouraged by difficulties however immense and apparently insuperable. We believe that God is with us and in that faith we shall conquer. We believe that humanity needs us and it is the love and service of humanity, of our country, of the race, of our
religion that will purify our heart and inspire our action in the struggle.

The task we set before ourselves is not mechanical but moral and spiritual. We aim not at the alteration of a form of government but at the building up of a nation. Of that task politics is a part, but only a part. We shall devote ourselves not to politics alone, nor to social questions alone, nor to theology or philosophy or literature or science by themselves, but we include all these in one entity which we believe to be all-important, the dharma, the national religion which we also believe to be universal. There is a mighty law of life, a great principle of human evolution, a body of spiritual knowledge and experience of which India has always been destined to be guardian, exemplar and missionary. This is the sanātana dharma, the eternal religion. Under the stress of alien impacts she has largely lost hold not of the structure of that dharma, but of its living reality. For the religion of India is nothing if it is not lived. It has to be applied not only to life, but to the whole of life; its spirit has to enter into and mould our society, our politics, our literature, our science, our individual character, affections and aspirations. To understand the heart of this dharma, to experience it as a truth, to feel the high emotions to which it rises and to express and execute it in life is what we understand by Karmayoga. We believe that it is to make the yoga the ideal of human life that India rises today; by the yoga she will get the strength to realise her freedom, unity and greatness, by the yoga she will keep the strength to preserve it. It is a spiritual revolution we foresee and the material is only its shadow and reflex.

The European sets great store by machinery. He seeks to renovate humanity by schemes of society and systems of government; he hopes to bring about the millennium by an act of Parliament. Machinery is of great importance, but only as a working means for the spirit within, the force behind. The nineteenth century in India aspired to political emancipation, social renovation, religious vision and rebirth, but it failed because it adopted Western motives and methods, ignored the spirit, history and destiny of our race and thought that by taking over
European education, European machinery, European organisation and equipment we should reproduce in ourselves European prosperity, energy and progress. We of the twentieth century reject the aims, ideals and methods of the Anglicised nineteenth precisely because we accept its experience. We refuse to make an idol of the present; we look before and after, backward to the mighty history of our race, forward to the grandiose destiny for which that history has prepared it.

We do not believe that our political salvation can be attained by enlargement of Councils, introduction of the elective principle, colonial self-government or any other formula of European politics. We do not deny the use of some of these things as instruments, as weapons in a political struggle, but we deny their sufficiency whether as instruments or ideals and look beyond to an end which they do not serve except in a trifling degree. They might be sufficient if it were our ultimate destiny to be an outlying province of the British Empire or a dependent adjunct of European civilisation. That is a future which we do not think it worth making any sacrifice to accomplish. We believe on the other hand that India is destined to work out her own independent life and civilisation, to stand in the forefront of the world and solve the political, social, economical and moral problems which Europe has failed to solve, yet the pursuit of whose solution and the feverish passage in that pursuit from experiment to experiment, from failure to failure she calls her progress. Our means must be as great as our ends and the strength to discover and use the means so as to attain the end can only be found by seeking the eternal source of strength in ourselves.

We do not believe that by changing the machinery so as to make our society the ape of Europe we shall effect social renovation. Widow-remarriage, substitution of class for caste, adult marriage, intermarriages, interdining and the other nostrums of the social reformer are mechanical changes which, whatever their merits or demerits, cannot by themselves save the soul of the nation alive or stay the course of degradation and decline. It is the spirit alone that saves, and only by becoming great and
free in heart can we become socially and politically great and free.

We do not believe that by multiplying new sects limited within the narrower and inferior ideas of religion imported from the West or by creating organisations for the perpetuation of the mere dress and body of Hinduism we can recover our spiritual health, energy and greatness. The world moves through an indispensable interregnum of free thought and materialism to a new synthesis of religious thought and experience, a new religious world-life free from intolerance, yet full of faith and fervour, accepting all forms of religion because it has an unshakable faith in the One. The religion which embraces Science and faith, Theism, Christianity, Mahomedanism and Buddhism and yet is none of these, is that to which the World-Spirit moves. In our own, which is the most sceptical and the most believing of all, the most sceptical because it has questioned and experimented the most, the most believing because it has the deepest experience and the most varied and positive spiritual knowledge, — that wider Hinduism which is not a dogma or combination of dogmas but a law of life, which is not a social framework but the spirit of a past and future social evolution, which rejects nothing but insists on testing and experiencing everything and when tested and experienced turning it to the soul's uses, in this Hinduism we find the basis of the future world-religion. This sanātana dharma has many scriptures, Veda, Vedanta, Gita, Upanishad, Darshana, Purana, Tantra, nor could it reject the Bible or the Koran; but its real, most authoritative scripture is in the heart in which the Eternal has His dwelling. It is in our inner spiritual experiences that we shall find the proof and source of the world's Scriptures, the law of knowledge, love and conduct, the basis and inspiration of Karmayoga.

Our aim will therefore be to help in building up India for the sake of humanity — this is the spirit of the Nationalism which we profess and follow. We say to humanity, “The time has come when you must take the great step and rise out of a material existence into the higher, deeper and wider life towards which humanity moves. The problems which have troubled mankind
can only be solved by conquering the kingdom within, not by harnessing the forces of Nature to the service of comfort and luxury, but by mastering the forces of the intellect and the spirit, by vindicating the freedom of man within as well as without and by conquering from within external Nature. For that work the resurgence of Asia is necessary, therefore Asia rises. For that work the freedom and greatness of India is essential, therefore she claims her destined freedom and greatness, and it is to the interest of all humanity, not excluding England, that she should wholly establish her claim.”

We say to the nation, “It is God’s will that we should be ourselves and not Europe. We have sought to regain life by following the law of another being than our own. We must return and seek the sources of life and strength within ourselves. We must know our past and recover it for the purposes of our future. Our business is to realise ourselves first and to mould everything to the law of India’s eternal life and nature. It will therefore be the object of the Karmayogin to read the heart of our religion, our society, our philosophy, politics, literature, art, jurisprudence, science, thought, everything that was and is ours, so that we may be able to say to ourselves and our nation, ‘This is our dharma.’ We shall review European civilisation entirely from the standpoint of Indian thought and knowledge and seek to throw off from us the dominating stamp of the Occident; what we have to take from the West we shall take as Indians. And the dharma once discovered we shall strive our utmost not only to profess but to live, in our individual actions, in our social life, in our political endeavours.”

We say to the individual and especially to the young who are now arising to do India’s work, the world’s work, God’s work, “You cannot cherish these ideals, still less can you fulfil them if you subject your minds to European ideas or look at life from the material standpoint. Materially you are nothing, spiritually you are everything. It is only the Indian who can believe everything, dare everything, sacrifice everything. First therefore become Indians. Recover the patrimony of your forefathers. Recover the Aryan thought, the Aryan discipline, the
Aryan character, the Aryan life. Recover the Vedanta, the Gita, the Yoga. Recover them not only in intellect or sentiment but in your lives. Live them and you will be great and strong, mighty, invincible and fearless. Neither life nor death will have any terrors for you. Difficulty and impossibility will vanish from your vocabularies. For it is in the spirit that strength is eternal and you must win back the kingdom of yourselves, the inner Swaraj, before you can win back your outer empire. There the Mother dwells and She waits for worship that She may give strength. Believe in Her, serve Her, lose your wills in Hers, your egoism in the greater ego of the country, your separate selfishness in the service of humanity. Recover the source of all strength in yourselves and all else will be added to you, social soundness, intellectual pre-eminence, political freedom, the mastery of human thought, the hegemony of the world.”
Karmayoga

WE HAVE spoken of Karmayoga as the application of Vedanta and Yoga to life. To many who take their knowledge of Hinduism secondhand this may seem a doubtful definition. It is ordinarily supposed by “practical” minds that Vedanta as a guide to life and Yoga as a method of spiritual communion are dangerous things which lead men away from action to abstraction. We leave aside those who regard all such beliefs as mysticism, self-delusion or imposture; but even those who reverence and believe in the high things of Hinduism have the impression that one must remove oneself from a full human activity in order to live the spiritual life. Yet the spiritual life finds its most potent expression in the man who lives the ordinary life of men in the strength of the Yoga and under the law of the Vedanta. It is by such a union of the inner life and the outer that mankind will eventually be lifted up and become mighty and divine. It is a delusion to suppose that Vedanta contains no inspiration to life, no rule of conduct, and is purely metaphysical and quietistic. On the contrary, the highest morality of which humanity is capable finds its one perfect basis and justification in the teachings of the Upanishads and the Gita. The characteristic doctrines of the Gita are nothing if they are not a law of life, a dharma, and even the most transcendental aspirations of the Vedanta presuppose a preparation in life, for it is only through life that one can reach to immortality. The opposite opinion is due to certain tendencies which have bulked large in the history and temperament of our race. The ultimate goal of our religion is emancipation from the bondage of material Nature and freedom from individual rebirth, and certain souls, among the highest we have known, have been drawn by the attraction of the final hush and purity to dissociate themselves from life and bodily action in order more swiftly and easily to reach the goal. Standing like
mountain-peaks above the common level, they have attracted all eyes and fixed this withdrawal as the highest and most commanding Hindu ideal. It is for this reason that Sri Krishna laid so much stress on the perfect Yogan’s cleaving to life and human activity even after his need of them was over, lest the people, following, as they always do, the example of their best, turn away from their dharma and bastard confusion reign. The ideal Yogan is no withdrawn and pent-up force, but ever engaged in doing good to all creatures, either by the flood of the divine energy that he pours on the world or by himself standing in the front of humanity, its leader in the march and the battle, but unbound by his works and superior to his personality.

Moreover the word Vedanta is usually identified with the strict Monism and the peculiar theory of Maya established by the lofty and ascetic intellect of Shankara. But it is the Upanishads themselves and not Shankara’s writings, the text and not the commentary, that are the authoritative Scripture of the Vedantin. Shankara’s, great and temporarily satisfying as it was, is still only one synthesis and interpretation of the Upanishads. There have been others in the past which have powerfully influenced the national mind and there is no reason why there should not be a yet more perfect synthesis in the future. It is such a synthesis, embracing all life and action in its scope, that the teachings of Sri Ramakrishna and Vivekananda have been preparing. What is dimly beginning now is a repetition on a wider stage of what happened once before in India, more rapidly but to smaller issues, when the Buddha lived and taught his philosophy and ethics to the Aryan nations. Then as now a mighty spirit, it matters not whether Avatar or Vibhuti, the full expression of God in man or a great outpouring of the divine energy, came down among men and brought into their daily life and practice the force and impulse of utter spirituality. And this time it is the full light and not a noble part, unlike Buddhism which, expressing Vedantic morality, yet ignored a fundamental reality of Vedanta and was therefore expelled from its prime seat and cradle. The material result was then what it will be now, a great political, moral and social revolution which made India
the Guru of the nations and carried the light she had to give all over the civilised world, moulding ideas and creating forms which are still extant and a living force. Already the Vedanta and the Yoga have exceeded their Asiatic limit and are beginning to influence the life and practice of America and Europe; and they have long been filtering into Western thought by a hundred indirect channels. But these are small rivers and underground streams. The world waits for the rising of India to receive the divine flood in its fullness.

Yoga is communion with God for knowledge, for love or for work. The Yogin puts himself into direct relation with that which is omniscient and omnipotent within man and without him. He is in tune with the infinite, he becomes a channel for the strength of God to pour itself out upon the world whether through calm benevolence or active beneficence. When a man rises by putting from him the slough of self and lives for others and in the joys and sorrows of others; — when he works perfectly and with love and zeal, but casts away the anxiety for results and is neither eager for victory nor afraid of defeat; — when he devotes all his works to God and lays every thought, word and deed as an offering on the divine altar; — when he gets rid of fear and hatred, repulsion and disgust and attachment, and works like the forces of Nature, unhasting, unresting, inevitably, perfectly; — when he rises above the thought that he is the body or the heart or the mind or the sum of these and finds his own and true self; — when he becomes aware of his immortality and the unreality of death; — when he experiences the advent of knowledge and feels himself passive and the divine force working unresisted through his mind, his speech, his senses and all his organs; — when having thus abandoned whatever he is, does or has to the Lord of all, the Lover and Helper of mankind, he dwells permanently in Him and becomes incapable of grief, disquiet or false excitement, — that is Yoga. Pranayam and Asans, concentration, worship, ceremonies, religious practice are not themselves Yoga but only a means towards Yoga. Nor is Yoga a difficult or dangerous path, it is safe and easy to all who take refuge with the Inner Guide and Teacher. All men are potentially capable of it, for there is no
man who has not strength or faith or love developed or latent in his nature, and any one of these is a sufficient staff for the Yogin. All cannot, indeed, reach in a single life the highest in this path, but all can go forward; and in proportion as a man advances he gets peace, strength and joy. And even a little of this dharma delivers man or nation out of great fear.

It is an error, we repeat, to think that spirituality is a thing divorced from life. “Abandon all” says the Isha Upanishad “that thou mayst enjoy all, neither covet any man’s possession. But verily do thy deeds in this world and wish to live thy hundred years; no other way is given thee than this to escape the bondage of thy acts.” It is an error to think that the heights of religion are above the struggles of this world. The recurrent cry of Sri Krishna to Arjuna insists on the struggle; “Fight and overthrow thy opponents!” “Remember me and fight!” “Give up all thy works to me with a heart full of spirituality, and free from craving, free from selfish claims, fight! let the fever of thy soul pass from thee.” It is an error to imagine that even when the religious man does not give up his ordinary activities, he yet becomes too sattwic, too saintly, too loving or too passionless for the rough work of the world. Nothing can be more extreme and uncompromising than the reply of the Gita in the opposite sense, “Whosoever has his temperament purged from egoism, whosoever suffers not his soul to receive the impress of the deed, though he slay the whole world yet he slays not and is not bound.” The Charioteer of Kurukshetra driving the car of Arjuna over that field of ruin is the image and description of Karmayoga; for the body is the chariot and the senses are the horses of the driving and it is through the bloodstained and miresunk ways of the world that Sri Krishna pilots the soul of man to Vaicuntha.
Man — Slave or Free?

The exclusive pursuit of Yoga by men who seclude themselves either physically or mentally from the contact of the world has led to an erroneous view of this science as something mystic, far-off and unreal. The secrecy which has been observed with regard to Yogic practices, — a necessary secrecy in the former stages of human evolution, — has stereotyped this error. Practices followed by men who form secret circles and confine the instruction in the mysteries strictly to those who have a certain preparatory fitness, inevitably bear the stamp to the outside world of occultism. In reality there is nothing intrinsically hidden, occult or mystic about Yoga. Yoga is based upon certain laws of human psychology, a certain knowledge about the power of the mind over the body and the inner spirit over the mind which are not generally realised and have hitherto been considered by those in the secret too momentous in their consequences for disclosure until men should be trained to use them aright. Just as a set of men who had discovered and tested the utmost possibilities of mesmerism and hypnotism might hesitate to divulge them freely to the world lest the hypnotic power should be misused by ignorance or perversity or abused in the interests of selfishness and crime, so the Yogins have usually preserved the knowledge of these much greater forces within us in a secrecy broken only when they were sure of the previous ethical and spiritual training of the neophyte and his physical and moral fitness for the Yogic practices. It became therefore an established rule for the learner to observe strict reserve as to the inner experiences of Yoga and for the developed Yoganin as far as possible to conceal himself. This has not prevented treatises and manuals from being published dealing with the physical or with the moral and intellectual sides of Yoga. Nor has it prevented great spirits who have gained their Yoga not
by the ordinary careful and scientific methods but by their own strength and the special grace of God, from revealing themselves and their spiritual knowledge to mankind and in their intense love for humanity imparting something of their power to the world. Such were Buddha, Christ, Mahomed, Chaitanya, such have been Ramakrishna and Vivekananda. It is still the orthodox view that the experiences of Yoga must not be revealed to the uninitiated. But a new era dawns upon us in which the old laws must be modified. Already the West is beginning to discover the secrets of Yoga. Some of its laws have revealed themselves however dimly and imperfectly to the scientists of Europe while others through Spiritualism, Christian Science, clairvoyance, telepathy and other modern forms of occultism are being almost discovered by accident as if by men groping in the dark and stumbling over truths they cannot understand. The time has almost come when India can no longer keep her light to herself but must pour it out upon the world. Yoga must be revealed to mankind because without it mankind cannot take the next step in the human evolution.

The psychology of the human race has not yet been discovered by Science. All creation is essentially the same and proceeds by similar though not identical laws. If therefore we see in the outside material world that all phenomena proceed from and can be reduced to a single causal substance from which they were born, in which they move and to which they return, the same truth is likely to hold good in the psychical world. The unity of the material universe has now been acknowledged by the scientific intellect of Europe and the high priests of atheism and materialism in Germany have declared the *ekam evādvitīyam* in matter with no uncertain voice. In so doing they have merely reaffirmed the discovery made by Indian masters of the Yogic science thousands of years ago. But the European scientists have not discovered any sure and certain methods, such as they have in dealing with gross matter, for investigating psychical phenomena. They can only observe the most external manifestations of mind in action. But in these manifestations the mind is so much enveloped in the action of the outer objects and seems so
dependent on them that it is very difficult for the observer to find out the springs of its action or any regularity in its workings. The European scientists have therefore come to the conclusion that it is the stimulations of outside objects which are the cause of psychical phenomena, and that even when the mind seems to act of itself and on its own material it is only associating, grouping together and manipulating the recorded experiences from outside objects. The very nature of mind is, according to them, a creation of past material experience transmitted by heredity with such persistence that we have grown steadily from the savage with his rudimentary mind to the civilised man of the twentieth century. As a natural result of these materialistic theories, science has found it difficult to discover any true psychical centre for the multifarious phenomena of mind and has therefore fixed upon the brain, the material organ of thought, as the only real centre. From this materialistic philosophy have resulted certain theories very dangerous to the moral future of mankind. First, man is a creation and slave of matter. He can only master matter by obeying it. Secondly, the mind itself is a form of gross matter and not independent of and master of the senses. Thirdly, there is no real free will, because all our action is determined by two great forces, heredity and environment. We are the slaves of our nature, and where we seem to be free from its mastery, it is because we are yet worse slaves of our environment, worked on by the forces that surround and manipulate us.

It is from these false and dangerous doctrines of materialism which tend to subvert man's future and hamper his evolution, that Yoga gives us a means of escape. It asserts on the contrary man's freedom from matter and gives him a means of asserting that freedom. The first great fundamental discovery of the Yogins was a means of analysing the experiences of the mind and the heart. By Yoga one can isolate mind, watch its workings as under a microscope, separate every minute function of the various parts of the antahkarana, the inner organ, every mental and moral faculty, test its isolated workings as well as its relations to other functions and faculties and trace backwards the operations of mind to subtler and ever subtler sources until just as material
analysis arrives at a primal entity from which all proceeds, so Yoga analysis arrives at a primal spiritual entity from which all proceeds. It is also able to locate and distinguish the psychical centre to which all psychical phenomena gather and so to fix the roots of personality. In this analysis its first discovery is that mind can entirely isolate itself from external objects and work in itself and of itself. This does not, it is true, carry us very far because it may be that it is merely using the material already stored up by its past experiences. But the next discovery is that the farther it removes itself from objects, the more powerfully, surely, rapidly can the mind work with a swifter clarity, with a victorious and sovereign detachment. This is an experience which tends to contradict the scientific theory, that mind can withdraw the senses into itself and bring them to bear on a mass of phenomena of which it is quite unaware when it is occupied with external phenomena. Science will naturally challenge these as hallucinations. The answer is that these phenomena are related to each other by regular, simple and intelligible laws and form a world of their own independent of thought acting on the material world. Here too Science has this possible answer that this supposed world is merely an imaginative reflex in the brain of the material world and to any arguments drawn from the definiteness and unexpectedness of these subtle phenomena and their independence of our own will and imagination it can always oppose its theory of unconscious cerebration and, we suppose, unconscious imagination. The fourth discovery is that mind is not only independent of external matter, but its master; it can not only reject and control external stimuli, but can defy such apparently universal material laws as that of gravitation and ignore, put aside and make nought of what are called laws of nature and are really only the laws of material nature, inferior and subject to the psychical laws because matter is a product of mind and not mind a product of matter. This is the decisive discovery of Yoga, its final contradiction of materialism. It is followed by the crowning realisation that there is within us a source of immeasurable force, immeasurable intelligence, immeasurable joy far above the possibility of weakness, above the
possibility of ignorance, above the possibility of grief which we can bring into touch with ourselves and, under arduous but not impossible conditions, habitually utilise or enjoy. This is what the Upanishads call the Brahman and the primal entity from which all things were born, in which they live and to which they return. This is God and communion with Him is the highest aim of Yoga — a communion which works for knowledge, for work, for delight.
Yoga and Human Evolution

The whole burden of our human progress has been an attempt to escape from the bondage to the body and the vital impulses. According to the scientific theory, the human being began as the animal, developed through the savage and consummated in the modern civilised man. The Indian theory is different. God created the world by developing the many out of the One and the material out of the spiritual. From the beginning, the objects which compose the physical world were arranged by Him in their causes, developed under the law of their being in the subtle or psychical world and then manifested in the gross or material world. From kāraṇa to sūkṣma, from sūkṣma to sthūla, and back again, that is the formula. Once manifested in matter the world proceeds by laws which do not change, from age to age, by a regular succession, until it is all withdrawn back again into the source from which it came. The material goes back into the psychical and the psychical is involved in its cause or seed. It is again put out when the period of expansion recurs and runs its course on similar lines but with different details till the period of contraction is due. Hinduism regards the world as a recurrent series of phenomena of which the terms vary but the general formula abides the same. The theory is only acceptable if we recognise the truth of the conception formulated in the Vishnu Purana of the world as vijnāna-vijṛmbhitāni, developments of ideas in the Universal Intelligence which lies at the root of all material phenomena and by its indwelling force shapes the growth of the tree and the evolution of the clod as well as the development of living creatures and the progress of mankind. Whichever theory we take, the laws of the material world are not affected. From aeon to aeon, from Kalpa to Kalpa Narayan manifests himself in an ever-evolving humanity which grows in experience by a
series of expansions and contractions towards its destined self-realisation in God. That evolution is not denied by the Hindu theory of yugas. Each age in the Hindu system has its own line of moral and spiritual evolution and the decline of the dharma or established law of conduct from the Satya to the Kaliyuga is not in reality a deterioration but a detrition of the outward forms and props of spirituality in order to prepare a deeper spiritual intensity within the heart. In each Kaliyuga mankind gains something in essential spirituality. Whether we take the modern scientific or the ancient Hindu standpoint the progress of humanity is a fact. The wheel of Brahma rotates for ever but it does not turn in the same place; its rotations carry it forward.

The animal is distinguished from man by its enslavement to the body and the vital impulses. Aśānāyā mṛtyuh, Hunger who is Death, evolved the material world from of old, and it is the physical hunger and desire and the vital sensations and primary emotions connected with the prāṇa that seek to feed upon the world in the beast and in the savage man who approximates to the condition of the beast. Out of this animal state, according to European Science, man rises working out the tiger and the ape by intellectual and moral development in the social condition. If the beast has to be worked out, it is obvious that the body and the prāṇa must be conquered, and as that conquest is more or less complete, the man is more or less evolved. The progress of mankind has been placed by many predominatingly in the development of the human intellect, and intellectual development is no doubt essential to self-conquest. The animal and the savage are bound by the body because the ideas of the animal or the ideas of the savage are mostly limited to those sensations and associations which are connected with the body. The development of intellect enables a man to find the deeper self within and partially replace what our philosophy calls the dehātmaka-buddhi, the sum of ideas and sensations which make us think of the body as ourself, by another set of ideas which reach beyond the body, and, existing for their own delight and substituting intellectual and moral satisfaction as the chief objects of life, master, if they cannot entirely silence, the clamour of the lower sensual desires.
That animal ignorance which is engrossed with the cares and the pleasures of the body and the vital impulses, emotions and sensations is tamasic, the result of the predominance of the third principle of nature which leads to ignorance and inertia. That is the state of the animal and the lower forms of humanity which are called in the Purana the first or tamasic creation. This animal ignorance the development of the intellect tends to dispel and it assumes therefore an all-important place in human evolution.

But it is not only through the intellect that man rises. If the clarified intellect is not supported by purified emotions, the intellect tends to be dominated once more by the body and to put itself at its service and the lordship of the body over the whole man becomes more dangerous than in the natural state because the innocence of the natural state is lost. The power of knowledge is placed at the disposal of the senses, sattva serves tanas, the god in us becomes the slave of the brute. The disservice which scientific Materialism is unintentionally doing the world is to encourage a return to this condition; the suddenly awakened masses of men, unaccustomed to deal intellectually with ideas, able to grasp the broad attractive innovations of free thought but unable to appreciate its delicate reservations, verge towards that reeling back into the beast, that relapse into barbarism which was the condition of the Roman Empire at a high stage of material civilisation and intellectual culture and which a distinguished British statesman declared the other day to be the condition to which all Europe approached. The development of the emotions is therefore the first condition of a sound human evolution. Unless the feelings tend away from the body and the love of others takes increasingly the place of the brute love of self, there can be no progress upward. The organisation of human society tends to develop the altruistic element in man which makes for life and battles with and conquers asanāyā mṛtyuh. It is therefore not the struggle for life, or at least not the struggle for our own life, but the struggle for the life of others which is the most important term in evolution,—for our children, for our family, for our class, for our community, for our race and nation, for humanity. An ever-enlarging self takes the place of
the old narrow self which is confined to our individual mind and body, and it is this moral growth which society helps and organises.

So far there is little essential difference between our own ideas of human progress and those of the West except in this vital point that the West believes this evolution to be a development of matter and the satisfaction of the reason, the reflective and observing intellect, to be the highest term of our progress. Here it is that our religion parts company with Science. It declares the evolution to be a conquest of matter by the recovery of the deeper emotional and intellectual self which was involved in the body and overclouded by the desires of the prāṇa. In the language of the Upanishads the manāhkoṣa and the buddhikoṣa are more than the prāṇakoṣa and annakoṣa and it is to them that man rises in his evolution. Religion farther seeks a higher term for our evolution than the purified emotions or the clarified activity of the observing and reflecting intellect. The highest term of evolution is the spirit in which knowledge, love and action, the threefold dharma of humanity, find their fulfilment and end. This is the ātmān in the ānandakoṣa, and it is by communion and identity of this individual self with the universal self which is God that man will become entirely pure, entirely strong, entirely wise and entirely blissful, and the evolution will be fulfilled. The conquest of the body and the vital self by the purification of the emotions and the clarification of the intellect was the principal work of the past. The purification has been done by morality and religion, the clarification by science and philosophy, art, literature and social and political life being the chief media in which these uplifting forces have worked. The conquest of the emotions and the intellect by the spirit is the work of the future. Yoga is the means by which that conquest becomes possible.

In Yoga the whole past progress of humanity, a progress which it holds on a very uncertain lease, is rapidly summed up, confirmed and made an inalienable possession. The body is conquered, not imperfectly as by the ordinary civilised man, but entirely. The vital part is purified and made the instrument of the higher emotional and intellectual self in its relations with
the outer world. The ideas which go outward are replaced by the ideas which move within, the baser qualities are worked out of the system and replaced by those which are higher, the lower emotions are crowded out by the nobler. Finally all ideas and emotions are stilled and by the perfect awakening of the intuitive reason which places mind in communion with spirit the whole man is ultimately placed at the service of the Infinite. All false self merges into the true Self. Man acquires likeness, union or identification with God. This is mukti, the state in which humanity thoroughly realises the freedom and immortality which are its eternal goal.
Yoga and Hypnotism

WHEN the mind is entirely passive, then the force of Nature which works in the whole of animate and inanimate creation, has free play; for it is in reality this force which works in man as well as in the sun and star. There is no doubt of this truth whether in Hinduism or in Science. This is the thing called Nature, the sum of cosmic force and energy, which alone Science recognises as the source of all work and activity. This also is the Prakriti of the Hindus to which under different names Sankhya and Vedanta agree in assigning a similar position and function in the Universe. But the immediate question is whether this force can act in man independently of man’s individual will and initiative. Must it always act through his volition or has it a power of independent operation? The first real proof which Science has had of the power of action independent of volition is in the phenomena of hypnotism. Unfortunately the nature of hypnotism has not been properly understood. It is supposed that by putting the subject to sleep the hypnotist is able in some mysterious and unexplained way to substitute his will for the subject’s. In a certain sense all the subject’s activities in the hypnotic state are the results of his own volition, but that volition is not spontaneous, it is used as a slave by the operator working through the medium of suggestion. Whatever the hypnotist suggests that the subject shall think, act or feel, he thinks, acts or feels, and whatever the hypnotist suggests that the subject shall become, he becomes. What is it that gives the operator this stupendous power? Why should the mere fact of a man passing into this sleep-condition suspend the ordinary reactions of mind and body and substitute others at the mere word of the man who has said to him, “Sleep”? It is sometimes supposed that it is the superior will of the hypnotist which overcomes the will of the other and makes it a slave. There
are two strong objections to this view. It does not appear to be true that it is the weak and distracted will that is most easily hypnotised; on the contrary the strong concentrated mind forms a good subject. Secondly, if it were the operator’s will using the will of the subject, then the results produced must be such as the latter could himself bring about, since the capacities of the instrument cannot be exceeded by the power working through the instrument. Even if we suppose that the invading will brings with it its own force still the results produced must not exceed the sum of its capacity plus the capacity of the instrument. If they commonly do so, we must suppose that it is neither the will of the operator nor the will of the subject nor the sum of these two wills that is active, but some other and more potent force. This is precisely what we see in hypnotic performance.

What is this force that enables or compels a weak man to become so rigid that strong arms cannot bend him? that reverses the operations of the senses and abrogates pain? that changes the fixed character of a man in the shortest of periods? that is able to develop power where there was no power, moral strength where there was weakness, health where there was disease? that in its higher manifestations can exceed the barriers of space and time and produce that far-sight, far-hearing and far-thinking which shows mind to be an untrammelled agent or medium pervading the world and not limited to the body which it informs or seems to inform? The European scientist experimenting with hypnotism is handling forces which he cannot understand, stumbling on truths of which he cannot give a true account. His feet are faltering on the threshold of Yoga. It is held by some thinkers, and not unreasonably if we consider these phenomena, that mind is all and contains all. It is not the body which determines the operations of the mind, it is the mind which determines the laws of the body. It is the ordinary law of the body that if it is struck, pierced or roughly pressed it feels pain. This law is created by the mind which associates pain with these contacts, and if the mind changes its dharma and is able to associate with these contacts not pain but insensibility or pleasure, then they will bring about those results of insensibility or pleasure and no other. The pain
and pleasure are not the result of the contact, neither is their seat in the body; they are the result of association and their seat is in the mind. Vinegar is sour, sugar sweet, but to the hypnotised mind vinegar can be sweet, sugar sour. The sourness or sweetness is not in the vinegar or sugar, but in the mind. The heart also is the subject of the mind. My emotions are like my physical feelings, the result of association, and my character is the result of accumulated past experiences with their resultant associations and reactions crystallising into habits of mind and heart summed up in the word, character. These things like all the rest that are made of the stuff of associations are not permanent or binding but fluid and mutable, anityāḥ sarvasaṁskārāḥ. If my friend blames me, I am grieved; that is an association and not binding. The grief is not the result of the blame but of an association in the mind. I can change the association so far that blame will cause me no grief, praise no elation. I can entirely stop the reactions of joy and grief by the same force that created them. They are habits of the mind, nothing more. In the same way though with more difficulty I can stop the reactions of physical pain and pleasure so that nothing will hurt my body. If I am a coward today, I can be a hero tomorrow. The cowardice was merely the habit of associating certain things with pain and grief and of shrinking from the pain and grief; this shrinking and the physical sensations in the vital or nervous man which accompany it are called fear, and they can be dismissed by the action of the mind which created them. All these are propositions which European Science is even now unwilling to admit, yet it is being proved more and more by the phenomena of hypnotism that these effects can be temporarily at least produced by one man upon another; and it has even been proved that disease can be permanently cured or character permanently changed by the action of one mind upon another. The rest will be established in time by the development of hypnotism.

The difference between Yoga and hypnotism is that what hypnotism does for a man through the agency of another and in the sleeping state, Yoga does for him by his own agency and in the waking state. The hypnotic sleep is necessary in order
to prevent the activity of the subject’s mind full of old ideas and associations from interfering with the operator. In the wak- ing state he would naturally refuse to experience sweetness in vinegar or sourness in sugar or to believe that he can change from disease to health, cowardice to heroism by a mere act of faith; his established associations would rebel violently and successfully against such contradictions of universal experience. The force which transcends matter would be hampered by the obstruction of ignorance and attachment to universal error. The hypnotic sleep does not make the mind a tabula rasa but it renders it passive to everything but the touch of the operator. Yoga similarly teaches passivity of the mind so that the will may act unhampered by the saṁskāras or old associations. It is these saṁskāras, the habits formed by experience in the body, heart or mind, that form the laws of our psychology. The associations of the mind are the stuff of which our life is made. They are more persistent in the body than in the mind and therefore harder to alter. They are more persistent in the race than in the individual; the conquest of the body and mind by the individual is comparatively easy and can be done in the space of a single life, but the same conquest by the race involves the development of ages. It is conceivable, however, that the practice of Yoga by a great number of men and persistence in the practice by their descendants might bring about profound changes in human psychology and, by stamping these changes into body and brain through heredity, evolve a superior race which would endure and by the law of the survival of the fittest eliminate the weaker kinds of humanity. Just as the rudimentary mind of the animal has been evolved into the fine instrument of the human being so the rudiments of higher force and faculty in the present race might evolve into the perfect buddhi of the Yogin.

Yo yacabbraddhaḥ sa eva saḥ. According as is a man’s fixed and complete belief, that he is,—not immediately always but sooner or later, by the law that makes the psychical tend inevitably to express itself in the material. The will is the agent by which all these changes are made and old saṁskāras replaced by new, and the will cannot act without faith. The question then
arises whether mind is the ultimate force or there is another which communicates with the outside world through the mind. Is the mind the agent or simply the instrument? If the mind be all, then it is only animals that can have the power to evolve; but this does not accord with the laws of the world as we know them. The tree evolves, the clod evolves, everything evolves. Even in animals it is evident that mind is not all in the sense of being the ultimate expression of existence or the ultimate force in Nature. It seems to be all only because that which is all expresses itself in the mind and passes everything through it for the sake of manifestation. That which we call mind is a medium which pervades the world. Otherwise we could not have that instantaneous and electrical action of mind upon mind of which human experience is full and of which the new phenomena of hypnotism, telepathy etc. are only fresh proofs. There must be contact, there must be interpenetration if we are to account for these phenomena on any reasonable theory. Mind therefore is held by the Hindus to be a species of subtle matter in which ideas are waves or ripples, and it is not limited by the physical body which it uses as an instrument. There is an ulterior force which works through this subtle medium called mind. An animal species develops, according to the modern theory, under the subtle influence of the environment. The environment supplies a need and those who satisfy the need develop a new species which survives because it is more fit. This is not the result of any intellectual perception of the need nor of a resolve to develop the necessary changes, but of a desire, often though not always a mute, inarticulate and unthought desire. That desire attracts a force which satisfies it. What is that force? The tendency of the psychical desire to manifest in the material change is one term in the equation; the force which develops the change in response to the desire is another. We have a will beyond mind which dictates the change, we have a force beyond mind which effects it. According to Hindu philosophy the will is the Jiva, the Purusha, the self in the ānandakoṣa acting through vijñāna, universal or transcendental mind; this is what we call spirit. The force is Prakriti or Shakti, the female principle in Nature.
which is at the root of all action. Behind both is the single Self of the universe which contains both Jiva and Prakriti, spirit and material energy. Yoga puts these ultimate existences within us in touch with each other and by stilling the activity of the sāṃskāras or associations in mind and body enables them to act swiftly, victoriously, and as the world calls it, miraculously. In reality there is no such thing as a miracle; there are only laws and processes which are not yet understood.

Yoga is therefore no dream, no illusion of mystics. It is known that we can alter the associations of mind and body temporarily and that the mind can alter the conditions of the body partially. Yoga asserts that these things can be done permanently and completely. For the body conquest of disease, pain and material obstructions, for the mind liberation from bondage to past experience and the heavier limitations of space and time, for the heart victory over sin and grief and fear, for the spirit unclouded bliss, strength and illumination, this is the gospel of Yoga, is the goal to which Hinduism points humanity.
The Greatness of the Individual

IN ALL movements, in every great mass of human action it is the Spirit of the Time, that which Europe calls the Zeitgeist and India Kala, who expresses himself. The very names are deeply significant. Kali, the Mother of all and destroyer of all, is the Shakti that works in secret in the heart of humanity manifesting herself in the perpetual surge of men, institutions and movements, Mahakala the Spirit within whose energy goes abroad in her and moulds the progress of the world and the destiny of the nations. His is the impetus which fulfils itself in Time, and once there is movement, impetus from the Spirit within, Time and the Mother take charge of it, prepare, ripen and fulfil. When the Zeitgeist, God in Time, moves in a settled direction, then all the forces of the world are called in to swell the established current towards the purpose decreed. That which consciously helps, swells it, but that which hinders swells it still more, and like a wave on the windswept Ocean, now rising, now falling, now high on the crest of victory and increase, now down in the troughs of discouragement and defeat, the impulse from the hidden Source sweeps onward to its preordained fulfilment. Man may help or man may resist, but the Zeitgeist works, shapes, overbears, insists.

The great and memorable vision of Kurukshetra when Sri Krishna manifesting his world-form declared himself as destroying Time, is significant of this deep perception of humanity. When Arjuna wished to cast aside his bow and quiver, when he said, “This is a sin we do and a great destruction of men and brothers, I will forbear,” Sri Krishna after convincing his intellect of error, proceeded by that marvellous vision described in the eleventh canto of the Gita to stamp the truth of things upon his imagination. Thus run the mighty stanzas:
"I am Time who waste and destroy the peoples; lo, I have arisen in my might, I am here to swallow up the nations. Even without thee all they shall not be, the men of war who stand arrayed in the opposing squadrons. Therefore do thou arise and get thee great glory, conquer thy foes and enjoy a great and wealthy empire. For these, they were slain even before and it is I who have slain them; be the occasion only, O Savyasachin."

It is not as the slow process of Time that Sri Krishna manifests himself; it is as the Zeitgeist consummating in a moment the work carefully prepared for decades that He appears to Arjuna. All have been moving inevitably towards the catastrophe of Kurukshetra. Men did not know it: those who would have done everything possible to avert the calamity, helped its coming by their action or inaction; those who had a glimpse of it strove in vain to stop the wheels of Fate; Sri Krishna himself as the *niskåma karmayogin* who does his duty without regard to results, went on that hopeless embassy to Hastinapura; but the Zeitgeist overbore all. It was only afterwards that men saw how like rivers speeding towards the sea, like moths winging towards the lighted flame all that splendid, powerful and arrogant Indian world with its clans of Kings and its weapons and its chariots and its gigantic armies were rushing towards the open mouths of the destroyer to be lost in His mighty jaws, to be mangled between His gnashing teeth. In the *lilå* of the Eternal there are movements that are terrible as well as movements that are sweet and beautiful. The dance of Brindaban is not complete without the death-dance of Kurukshetra; for each is a part of that great

www.holybooks.com
harmonic movement of the world which progresses from discord to accord, from hatred and strife to love and brotherhood, from evil to the fulfilment of the evolution by the transformation of suffering and sin into beauty, bliss and good, śivam, śāntam, śuddham, ānandam.

Who could resist the purpose of the Zeitgeist? There were strong men in India then by the hundred, great philosophers and Yogins, subtle statesmen, leaders of men, kings of thought and action, the efflorescence of a mighty intellectual civilisation at its height. A little turning to the right instead of to the left on the part of a few of these would, it might seem, have averted the whole catastrophe. So Arjuna thought when he flung aside his bow. He was the whole hope of the Pandavas and without him their victory must seem a mere dream and to fight an act of madness. Yet it is to him that the Zeitgeist proclaims the utter helplessness of the mightiest and the sure fulfilment of God’s decree. “Even without thee all they shall not be, the men of war who stand arrayed in the opposing squadrons.” For these men are only alive in the body; in that which stands behind and fulfils itself they are dead men. Whom God protects who shall slay? Whom God has slain who shall protect? The man who slays is only the occasion, the instrument by which the thing done behind the veil becomes the thing done on this side of it. That which was true of the great slaying at Kurukshetra is true of all things that are done in this world, of all the creation, destruction and preservation that make up the līlā.

The greatness of this teaching is for the great. Those who are commissioned to bring about mighty changes are full of the force of the Zeitgeist. Kali has entered into them and Kali when she enters into a man cares nothing for rationality and possibility. She is the force of Nature that whirls the stars in their orbits, lightly as a child might swing a ball, and to that force there is nothing impossible. She is aghaṭana-ghaṭana-paṭīyasi, very skilful in bringing about the impossible. She is the devāmaśaktīḥ svaguṇaṁ nigūḍhā, the Power of the Divine Spirit hidden in the modes of its own workings, and she needs nothing but time to carry out the purpose with which she is commissioned. She
moves in Time and the very movement fulfils itself, creates its means, accomplishes its ends. It is not an accident that she works in one man more than in another. He is chosen because he is a likely vessel, and having chosen him she neither rejects him till the purpose is fulfilled nor allows him to reject her. Therefore Sri Krishna tells Arjuna:

यदहुःक्रमश्चित्व न योत्त्व इति मन्यसि।
निश्चय व्यवसायस्य प्रकृतिस्य नियोजयति॥

“The thought which thou thinkest and takest refuge in egoism saying ‘I will not fight,’ this thy resolve is a vain thing; Nature will yoke thee to thy work.” When a man seems to have rejected his work, it merely means that his work is over and Kali leaves him for another. When a man who has carried out a great work is destroyed, it is for the egoism by which he has misused the force within that the force itself breaks him to pieces, as it broke Napoleon. Some instruments are treasured up, some are flung aside and shattered, but all are instruments. This is the greatness of great men, not that by their own strength they can determine great events, but that they are serviceable and specially-forged instruments of the Power which determines them. Mirabeau helped to create the French Revolution, no man more. When he set himself against it and strove, becoming a prop of monarchy, to hold back the wheel, did the French Revolution stop for the backsliding of France’s mightiest? Kali put her foot on Mirabeau and he disappeared; but the Revolution went on, for the Revolution was the manifestation of the Zeitgeist, the Revolution was the will of God.

So it is always. The men who prided themselves that great events were their work, because they seemed to have an initial hand in them, go down into the trench of Time and others march forward over their shattered reputations. Those who are swept forward by Kali within them and make no terms with Fate, they alone survive. The greatness of individuals is the greatness of the eternal Energy within.
The Process of Evolution

The end of a stage of evolution is usually marked by a powerful recrudescence of all that has to go out of the evolution. It is a principle of Nature that in order to get rid of any powerful tendency or deep-seated association in humanity, whether in the mass or in the individual, it has first to be exhausted by bhoga or enjoyment, afterwards to be dominated and weakened by nigraba or control and, finally, when it is weak, to be got rid of by samyama, rejection or self-dissociation. The difference between nigraba and samyama is that in the first process there is a violent struggle to put down, coerce and, if possible, crush the tendency, the reality of which is not questioned, but in the second process it is envisaged as a dead or dying force, its occasional return marked with disgust, then with impatience, finally with indifference as a mere ghost, vestige or faint echo of that which was once real but is now void of significance. Such a return is part of the process of Nature for getting rid of this undesirable and disappearing quantity.

SAMYAMA is unseasonable and would be fruitless when a force, quality or tendency is in its infancy or vigour, before it has had the enjoyment and full activity which is its due. When once a thing is born it must have its youth, growth, enjoyment, life and final decay and death; when once an impetus has been given by Prakriti to her creation, she insists that the velocity shall spend itself by natural exhaustion before it shall cease. To arrest the growth or speed unseasonably by force is nigraha, which can be effective for a time but not in perpetuity. It is said in the Gita that all things are ruled by their nature, to their nature they return and nigraha or repression is fruitless. What happens then is that the thing untimely slain by violence is not really dead, but withdraws for a time into the Prakriti which sent it forth, gathers an immense force and returns with extraordinary violence.
ravening for the rightful enjoyment which it was denied. We see this in the attempts we make to get rid of our evil samskāras or associations when we first tread the path of Yoga. If anger is a powerful element in our nature, we may put it down for a time by sheer force and call it self-control, but eventually unsatisfied Nature will get the better of us and the passion return upon us with astonishing force at an unexpected moment. There are only two ways by which we can effectively get the better of the passion which seeks to enslave us. One is by substitution, replacing it whenever it rises by the opposite quality, anger by thoughts of forgiveness, love or forbearance, lust by meditation on purity, pride by thoughts of humility and our own defects or nothingness; this is the method of Rajayoga, but it is a difficult, slow and uncertain method; for both the ancient traditions and the modern experience of Yoga show that men who had attained for long years the highest self-mastery have been suddenly surprised by a violent return of the thing they thought dead or for ever subject. Still this substitution, slow though it be, is one of the commonest methods of Nature and it is largely by this means, often unconsciously or half-consciously used, that the character of a man changes and develops from life to life or even in the bounds of a single lifetime. It does not destroy things in their seed and the seed which is not reduced to ashes by Yoga is always capable of sprouting again and growing into the complete and mighty tree. The second method is to give bhoga or enjoyment to the passion so as to get rid of it quickly. When it is satiated and surfeited by excessive enjoyment, it becomes weak and spent and a reaction ensues which establishes for a time the opposite force, tendency or quality. If that moment is seized by the Yogin for nigraha, the nigraha so repeated at every suitable opportunity becomes so far effective as to reduce the strength and vitality of the vṛtti sufficiently for the application of the final saimāyama. This method of enjoyment and reaction is also a favourite and universal method of Nature, but it is never complete in itself and, if applied to permanent forces or qualities, tends to establish a see-saw of opposite tendencies, extremely useful to the operations of Prakriti but from the point
The Process of Evolution

of view of self-mastery useless and inconclusive. It is only when this method is followed up by the use of sanâyama that it becomes effective. The Yogin regards the vṛttī merely as a play of Nature with which he is not concerned and of which he is merely the spectator; the anger, lust or pride is not his, it is the universal Mother’s and she works it and stills it for her own purposes. When, however, the vṛttī is strong, mastering and unspent, this attitude cannot be maintained in sincerity and to try to hold it intellectually without sincerely feeling it is mithyācāra, false discipline or hypocrisy. It is only when it is somewhat exhausted by repeated enjoyment and coercion that Prakriti or Nature at the command of the soul or Purusha can really deal with her own creation. She deals with it first by vairāgya in its crudest form of disgust, but this is too violent a feeling to be permanent; yet it leaves its mark behind in a deep-seated wish to be rid of its cause, which survives the return and temporary reign of the passion. Afterwards its return is viewed with impatience but without any acute feeling of intolerance. Finally supreme indifference or udāsinatā is gained and the final going out of the tendency by the ordinary process of Nature is watched in the true spirit of the sanâyami who has the knowledge that he is the witnessing soul and has only to dissociate himself from a phenomenon for it to cease. The highest stage leads either to mukti in the form of laya or disappearance, the vṛttī vanishing altogether and for good, or else to another kind of freedom when the soul knows that it is God’s līlā and leaves it to Him whether He shall throw out the tendency or use it for His own purposes. This is the attitude of the Karmayogin who puts himself in God’s hands and does work for His sake only, knowing that it is God’s force that works in him. The result of that attitude of self-surrender is that the Lord of all takes charge and according to the promise of the Gita delivers His servant and lover from all sin and evil, the vṛttis working in the bodily machine without affecting the soul and working only when He raises them up for His purposes. This is nirliptatā, the state of absolute freedom within the līlā.

The law is the same for the mass as for the individual. The process of human evolution has been seen by the eye of inspired
observation to be that of working out the tiger and the ape. The forces of cruelty, lust, mischievous destruction, pain-giving, folly, brutality, ignorance were once rampant in humanity, they had full enjoyment; then by the growth of religion and philosophy they began in periods of satiety such as the beginning of the Christian era in Europe to be partly replaced, partly put under control. As is the law of such things, they have always reverted again with greater or less virulence and sought with more or less success to reestablish themselves. Finally in the nineteenth century it seemed for a time as if some of these forces had, for a time at least, exhausted themselves and the hour for *saṁyama* and gradual dismissal from the evolution had really arrived. Such hopes always recur and in the end they are likely to bring about their own fulfilment, but before that happens another recoil is inevitable. We see plenty of signs of it in the reeling back into the beast which is in progress in Europe and America behind the fair outside of Science, progress, civilisation and humanitarianism, and we are likely to see more signs of it in the era that is coming upon us. A similar law holds in politics and society. The political evolution of the human race follows certain lines of which the most recent formula has been given in the watchwords of the French Revolution, freedom, equality and brotherhood. But the forces of the old world, the forces of despotism, the forces of traditional privilege and selfish exploitation, the forces of unfraternal strife and passionate self-regarding competition are always struggling to reseat themselves on the thrones of the earth. A determined movement of reaction is evident in many parts of the world and nowhere perhaps more than in England which was once one of the self-styled champions of progress and liberty. The attempt to go back to the old spirit is one of those necessary returns without which it cannot be so utterly exhausted as to be blotted out from the evolution. It rises only to be defeated and crushed again. On the other hand the force of the democratic tendency is not a force which is spent but one which has not yet arrived, not a force which has had the greater part of its enjoyment but one which is still vigorous, unsatisfied and eager for fulfilment. Every attempt to coerce it
in the past reacted eventually on the coercing force and brought back the democratic spirit fierce, hungry and unsatisfied, joining to its fair motto of “Liberty, Equality and Fraternity” the terrible addition “or Death”. It is not likely that the immediate future of the democratic tendency will satisfy the utmost dreams of the lover of liberty who seeks an anarchist freedom, or of the lover of equality who tries to establish a socialistic dead level, or of the lover of fraternity who dreams of a world-embracing communism. But some harmonisation of this great ideal is undoubtedly the immediate future of the human race. On the old forces of despotism, inequality and unbridled competition, after they have been once more overthrown, a process of gradual samiyama will be performed by which what has remained of them will be regarded as the disappearing vestiges of a dead reality and without any further violent coercion be transformed slowly and steadily out of existence.
CONSIDERABLE attention has been attracted and excitement created by the latest development of Mr. W. T. Stead’s agency for communicant spirits which he calls Julia’s Bureau. The supposed communications of Mr. Gladstone, Lord Beaconsfield and other distinguished politicians on the question of the Budget have awakened much curiosity, ridicule and even indignation. The ubiquitous eloquence of Lord Curzon has been set flowing by what he considers this unscrupulous method of pressing the august departed into the ranks of Liberal electioneering agents, and he has penned an indignant letter to the papers in which there is much ornate Curzonian twaddle about sacred mysteries and the sanctities of the grave. If there is anything at all in the alleged communications from departed souls which have become of increasing interest to the European world, it ought to be fairly established that the grave is nothing but a hole in the earth containing a rotting piece of matter with which the spirit has no farther connection, and that the spirit is very much the same after death as before, takes much interest in small, trivial and mundane matters and is very far from regarding his new existence as a solemn, sacred and mysterious affair. If so, we do not see why we either should approach the departed spirit with long and serious faces or with any more unusual feelings than curiosity, interest and eagerness to acquire knowledge of the other world and communication with those we knew and loved in this, in fact, the ordinary human and earthly feelings existing between souls sundered by time and space, but still capable of communication. But Lord Curzon still seems to be labouring under the crude Christian conception of the blessed dead as angels harping in heaven whose spotless plumes ought not to be roughly disturbed by human breath and of spiritual communication as a sort of necromancy, the spirit of
Mr. Gladstone being summoned from his earthly bed and getting into it again and tucking himself up comfortably in his coffin after Julia and Mr. Stead have done with him. We should have thought that in the bold and innovating mind of India's only Viceroy these coarse European superstitions ought to have been destroyed long ago.

It is not, however, Lord Curzon but Mr. Stead and the spirits with whom we have to deal. We know Mr. Stead as a pushing and original journalist, not always over-refined or delicate either in his actions or expressions, skilful in the advertisement of his views, excitable, earnest, declamatory, loud and even hysterical, if you will, in some of his methods, but certainly neither a liar nor a swindler. He does and says what he believes and nothing else. It is impossible to dismiss his Bureau as an imposture or mere journalistic réclame. It is impossible to dismiss the phenomena of spirit communications, even with all the imposture that unscrupulous moneymakers have imported into them, as unreal or a deception. All that can reasonably be said is that their true nature has not yet been established beyond dispute. There are two conceivable explanations, one that of actual spirit communication, the other that of vigorously dramatised imaginary conversations jointly composed with wonderful skill and consistency by the subconscious minds, whatever that may be, of the persons present, the medium being the chief dramaturge of this subconscious literary Committee. This theory is so wildly improbable and so obviously opposed to the nature of the phenomena themselves, that only an obstinate unwillingness to admit new facts and ideas can explain its survival, although it was natural and justifiable in the first stages of investigation. There remains the explanation of actual spirit communication. But even when we have decided on this hypothesis as the base of our investigation, we have to be on our guard against a multitude of errors; for the communications are vitiated first by the errors and self-deceptions of the medium and the sitters, then by the errors and self-deceptions of the communicant spirits, and, worst of all, by deliberate deceit, lies and jugglery on the part of the visitants from the other world. The element of deceit and
jugglery on the part of the medium and his helpers is not always small, but can easily be got rid of. Cheap scepticism and cheaper ridicule in such matters is only useful for comforting small brains and weak imaginations with a sense of superiority to the larger minds who do not refuse to enquire into phenomena which are at least widespread and of a consistently regular character. The true attitude is to examine carefully the nature of the phenomena, the conditions that now detract from their value and the possibility of removing them and providing perfect experimental conditions which would enable us to arrive at a satisfactory scientific result. Until the value of the communications is scientifically established, any attempt to use them for utilitarian, theatrical or yet lighter purposes is to be deprecated, as such misuse may end in shutting a wide door to potential knowledge upon humanity.

From this point of view Mr. Stead’s bizarre experiments are to be deprecated. The one redeeming feature about them is that, as conducted, they seem to remove the first elementary difficulty in the way of investigation, the possibility of human deceit and imposture. We presume that he has got rid of professional mediums and allows only earnest-minded and honourable investigators to be present. But the other elements of error and confusion are encouraged rather than obviated by the spirit and methods of Mr. Stead’s Bureau. First, there is the error and self-deception of the sitters. The spirit does not express himself directly but has to give his thoughts at third hand; they come first to the intermediary spirit, Julia or another, by her they are conveyed to the human medium and through him conveyed by automatic or conscious speech or writing to the listeners. It is obvious how largely the mind of the medium and, to a smaller but still great extent, the thought-impressions of the other sitters must interfere, and this without the least intention on their part, rather in spite of a strong wish in the opposite direction. Few men really understand how the human mind works or are fitted to watch the processes of their own conscious and half-conscious thought even when the mind is disinterested, still less when it is active and interested in the subject of communication. The sitters interfere, first, by putting in their own thoughts and expressions
suggested by the beginnings of the communication, so that what began as a spirit conversation ends in a tangle of the medium’s or sitters’ ideas with the little of his own that the spirit can get in now and then. They interfere not only by suggesting what they themselves think or would say on the subject, but by suggesting what they think the spirit ought dramatically to think or say, so that Mr. Gladstone is made to talk in interminable cloudy and circumambient periods which were certainly his oratorical style but can hardly have been the staple of his conversation, and Lord Beaconsfield is obliged to be cynical and immoral in the tone of his observations. They interfere again by eagerness, which sometimes produces replies according to the sitters’ wishes and sometimes others which are unpleasant or alarming, but in neither case reliable. This is especially the case in answers to questions about the future, which ought never to be asked. It is true that many astonishing predictions occur which are perfectly accurate, but these are far outweighed by the mass of false and random prediction. These difficulties can only be avoided by rigidly excluding every question accompanied by or likely to raise eagerness or expectation and by cultivating entire mental passivity. The last however is impossible to the medium unless he is a practised Yogin, or in a trance, or a medium who has attained the habit of passivity by an unconscious development due to long practice. In the sitters we do not see how it is to be induced. Still, without unemotional indifference to the nature of the answer and mental passivity the conditions for so difficult and delicate a process of communication cannot be perfect.

Error and self-deception from the other side of the veil cannot be obviated by any effort on this side; all that we can do is to recognise that the spirits are limited in knowledge and cabined by character, so that we have to allow for the mental and moral equation in the communicant when judging the truth and value of the communication. Absolute deception and falsehood can only be avoided by declining to communicate with spirits of a lower order and being on guard against their masquerading under familiar or distinguished names. How far Mr. Stead and his circle have guarded against these latter errors we cannot
say, but the spirit in which the sittings are conducted, does not encourage us to suppose that scrupulous care is taken in these respects. It is quite possible that some playful spirit has been enacting Mr. Gladstone to the too enthusiastic circle and has amused himself by elaborating those cloudy-luminous periods which he saw the sitters expected from the great deceased Opportunist. But we incline to the view that what we have got in this now famous spirit interview, is a small quantity of Gladstone, a great deal of Stead and a fair measure of the disembodied Julia and the assistant psychics.
The vexed question of spirit communication has become a subject of permanent public controversy in England. So much that is of the utmost importance to our views of the world, religion, science, life, philosophy, is crucially interested in the decision of this question, that no fresh proof or disproof, establishment or refutation of the genuineness and significance of spirit communications can go disregarded. But no discussion of the question which proceeds merely on first principles can be of any value. It is a matter of evidence, of the value of the evidence and of the meaning of the evidence. If the ascertained facts are in favour of spiritualism, it is no argument against the facts that they contradict the received dogmas of science or excite the ridicule alike of the enlightened sceptic and of the matter-of-fact citizen. If they are against spiritualism, it does not help the latter that it supports religion or pleases the imagination and flatters the emotions of mankind. Facts are what we desire, not enthusiasm or ridicule; evidence is what we have to weigh, not unsupported arguments or questions of fitness or probability. The improbable may be true, the probable entirely false.

In judging the evidence, we must attach especial importance to the opinion of men who have dealt with the facts at first hand. Recently, two such men have put succinctly their arguments for and against the truth of spiritualism, Mr. W. T. Stead and the famous conjurer, Mr. Maskelyne. We will deal with Mr. Maskelyne first, who totally denies the value of the facts on which spiritualism is based. Mr. Maskelyne puts forward two absolutely inconsistent theories, first, that spiritualism is all fraud and humbug, the second, that it is all subconscious mentality. The first was the theory which has hitherto been held by the opponents of the new phenomena, the second the
theory to which they are being driven by an accumulation of indisputable evidence. Mr. Maskelyne, himself a professed master of jugglery and illusion, is naturally disposed to put down all mediums as irregular competitors in his own art; but the fact that a conjuror can produce an illusory phenomenon, is no proof that all phenomena are conjuring. He farther argues that no spiritualistic phenomena have been produced when he could persuade Mr. Stead to adopt conditions which precluded fraud. We must know Mr. Maskelyne's conditions and have Mr. Stead's corroboration of this statement before we can be sure of the value we must attach to this kind of refutation. In any case we have the indisputable fact that Mr. Stead himself has been the medium in some of the most important and best ascertained of the phenomena. Mr. Maskelyne knows that Mr. Stead is an honourable man incapable of a huge and impudent fabrication of this kind and he is therefore compelled to fall back on the wholly unproved theory of the subconscious mind. His arguments do not strike us as very convincing. Because we often write without noticing what we are writing, mechanically, therefore, says this profound thinker, automatic writing must be the same kind of mental process. The one little objection to this sublimely felicitous argument is that automatic writing has no resemblance whatever to mechanical writing. When a man writes mechanically, he does not notice what he is writing; when he writes automatically, he notices it carefully and has his whole attention fixed on it. When he writes mechanically, his hand records something that it is in his mind to write; when he writes automatically, his hand transcribes something which it is not in his mind to write and which is often the reverse of what his mind would tell him to write. Mr. Maskelyne farther gives the instance of a lady writing a letter and unconsciously putting an old address which, when afterwards questioned, she could not remember. This amounts to no more than a fit of absent-mindedness in which an old forgotten fact rose to the surface of the mind and by the revival of old habit was reproduced on the paper, but again sank out of immediate consciousness as soon as the mind returned to the present. This is a mental phenomenon
essentially of the same class as our continuing unintentionally
to write the date of the last year even in this year's letters. In
one case it is the revival, in the other the persistence of an old
habit. What has this to do with the phenomena of automatic
writing which are of an entirely different class and not attended
by absent-mindedness at all? Mr. Maskelyne makes no attempt
to explain the writing of facts in their nature unknowable to
the medium, or of repeated predictions of the future, which are
common in automatic communications.

On the other side Mr. Stead's arguments are hardly more
convincing. He bases his belief, first, on the nature of the com-
munications from his son and others in which he could not
be deceived by his own mind and, secondly, on the fact that
not only statements of the past, but predictions of the future
occur freely. The first argument is of no value unless we know
the nature of the communication and the possibility or impos-
sibility of the facts stated having been previously known to
Mr. Stead. The second is also not conclusive in itself. There
are some predictions which a keen mind can make by inference
or guess, but, if we notice the hits and forget the misses, we
shall believe them to be prophecies and not ordinary previsions.
The real value of Mr. Stead's defence of the phenomena lies in
the remarkable concrete instance he gives of a prediction from
which this possibility is entirely excluded. The spirit of Julia, he
states, predicted the death within the year of an acquaintance
who, within the time stated, suffered from two illnesses, in one
of which the doctors despaired of her recovery. On each occa-
sion the predicting spirit was naturally asked whether the illness
was not to end in the death predicted, and on each she gave
an unexpected negative answer and finally predicted a death
by other than natural means. As a matter of fact, the lady in
question, before the year was out, leaped out of a window and
was killed. This remarkable prophecy was obviously neither a
successful inference nor a fortunate guess, nor even a surprising
coincidence. It is a convincing and indisputable prophecy. Its
appearance in the automatic writing can only be explained either
by the assumption that Mr. Stead has a subliminal self, calling
itself Julia, gifted with an absolute and exact power of prophecy
denied to the man as we know him,—a violent, bizarre and
unproved assumption,—or by the admission that there was a
communicant with superior powers to ordinary humanity using
the hand of the writer. Who that was, Julia or another, ghost,
spirit or other being, is a question that lies beyond. This contro-
versy, with the worthlessness of the arguments on either side and
the supreme worth of the one concrete and precise fact given, is
a signal proof of our contention that, in deciding this question,
it is not \textit{a priori} arguments, but facts used for their evidential
value as an impartial lawyer would use them, that will eventually
prevail.
A QUESTION which has hitherto divided human thought and received no final solution, is the freedom of the human being in his relation to the Power intelligent or unintelligent that rules the world. We strive for freedom in our human relations, to freedom we move as our goal, and every fresh step in our human progress is a further approximation to our ideal. But are we free in ourselves? We seem to be free, to do that which we choose and not that which is chosen for us; but it is possible that the freedom may be illusory and our apparent freedom may be a real and iron bondage. We may be bound by predestination, the will of a Supreme Intelligent Power, or blind inexorable Nature, or the necessity of our own previous development.

The first is the answer of the devout and submissive mind in its dependence on God, but, unless we adopt a Calvinistic fatalism, the admission of the guiding and overriding will of God does not exclude the permission of freedom to the individual. The second is the answer of the scientist; Heredity determines our Nature, the laws of Nature limit our action, cause and effect compel the course of our development, and, if it be urged that we may determine effects by creating causes, the answer is that our own actions are determined by previous causes over which we have no control and our action itself is a necessary response to a stimulus from outside. The third is the answer of the Buddhist and of post-Buddhistic Hinduism. “It is our fate, it is written on our forehead, when our Karma is exhausted, then alone our calamities will pass from us”; —this is the spirit of tamasic inaction justifying itself by a misreading of the theory of Karma.

If we go back to the true Hindu teaching independent of Buddhistic influence, we shall find that it gives us a reconciliation
of the dispute by a view of man’s psychology in which both Fate and Free-will are recognised. The difference between Buddhism and Hinduism is that to the former the human soul is nothing, to the latter it is everything. The whole universe exists in the spirit, by the spirit, for the spirit; all we do, think and feel is for the spirit. Nature depends upon the Atman, all its movement, play, action is for the Atman.

There is no Fate except insistent causality which is only another name for Law, and Law itself is only an instrument in the hands of Nature for the satisfaction of the spirit. Law is nothing but a mode or rule of action; it is called in our philosophy not Law but Dharma, holding together, it is that by which the action of the universe, the action of its parts, the action of the individual is held together. This action in the universal, the parts, the individuals is called Karma, work, action, energy in play, and the definition of Dharma or Law is action as decided by the nature of the thing in which action takes place, — svabhāva-niyatam karma. Each separate existence, each individual has a swabhava or nature and acts according to it, each group, species or mass of individuals has a swabhava or nature and acts according to it, and the universe also has its swabhava or nature and acts according to it. Mankind is a group of individuals and every man acts according to his human nature, that is his law of being as distinct from animals, trees or other groups of individuals. Each man has a distinct nature of his own and that is his law of being which ought to guide him as an individual. But beyond and above these minor laws is the great dharma of the universe which provides that certain previous karma or action must lead to certain new karma or results.

The whole of causality may be defined as previous action leading to subsequent action, Karma and Karmaphal. The Hindu theory is that thought and feeling, as well as actual speech or deeds, are part of Karma and create effects, and we do not accept the European sentiment that outward expression of thought and feeling in speech or deed is more important than the thought or feeling itself. This outward expression is only part of the thing expressed and its results are only part of the Karmaphal. The
previous karma has not one kind of result but many. In the first place, a certain habit of thought or feeling produces certain actions and speech or certain habits of action and speech in this life, which materialise in the next as good fortune or evil fortune. Again, it produces by its action for the good or ill of others a necessity of happiness or sorrow for ourselves in another birth. It produces, moreover, a tendency to persistence of that habit of thought or feeling in future lives, which involves the persistence of the good fortune or evil fortune, happiness or sorrow. Or, acting on different lines, it produces a revolt or reaction and replacement by opposite habits which in their turn necessitate opposite results for good or evil. This is the chain of karma, the bondage of works, which is the Hindu Fate and from which the Hindus seek salvation.

If, however, there is no escape from the Law, if Nature is supreme and inexorable, there can be no salvation; freedom becomes a chimera, bondage eternal. There can be no escape, unless there is something within us which is free and lord, superior to Nature. This entity the Hindu teaching finds in the spirit ever free and blissful which is one in essence and in reality with the Supreme Soul of the Universe. The spirit does not act, it is Nature that contains the action. If the spirit acted, it would be bound by its action. The thing that acts is Prakriti, Nature, which determines the Swabhava of things and is the source and condition of Law or dharma. The soul or Purusha holds up the swabhava, watches and enjoys the action and its fruit, sanctions the law or dharma. It is the king, Lord or Ishwara without whose consent nothing can be done by Prakriti. But the king is above the law and free.

It is this power of sanction that forms the element of free will in our lives. The spirit consents not that itself shall be bound, but that its enjoyment should be bound by time, space and causality and by the swabhava and the dharma. It consents to virtue or sin, good fortune or evil fortune, health or disease, joy or suffering, or it refuses them. What it is attached to, that Nature multiplies for it; what it is weary of, has vairâgya for, that Nature withdraws from it. Only, because the enjoyment is in
space and time, therefore, even after the withdrawal of consent, the habitual action continues for a time just as the locomotive continues to move after the steam is shut off, but in a little while it slows down and finally comes to a standstill. And because the enjoyment is in causality, the removal of the habit of action is effected not spontaneously and freely, but by an established process or one of many established processes. This is the great truth now dawning on the world, that Will is the thing which moves the world and that Fate is merely a process by which Will fulfils itself.

But in order to feel its mastery of Nature, the human soul must put itself into communion with the infinite and universal Spirit. Its will must be one with the universal Will. The human soul is one with the universal Spirit, but in the body it stands out as something separate and unconnected, because a certain freedom is permitted it in order that the swabhava of things may be diversely developed in different bodies. In using this freedom the soul may do it ignorantly or knowingly. If it uses it ignorantly, it is not really free, for ignorance brings with it the illusion of enslavement to Nature. Used knowingly, the freedom of the soul becomes one with surrender to the universal Will. Either apparent bondage to Fate in Nature or realised freedom from Nature in the universal freedom and lordship of the Paramatman and Parameshwara, this is the choice offered to the human soul. The gradual self-liberation from bondage to Nature is the true progress of humanity. The inert stone or block is a passive sport of natural laws, God is their Master. Man stands between these two extreme terms and moves upward from one to the other.
The Three Purushas

THE GREATEST of all the philosophical problems which human thought has struggled to solve, is the exact nature and relation to us of the conscious Intelligence in the phenomenal existence around. The idealist denies the phenomenal existence, the materialist denies the conscious Intelligence. To the former, phenomenon is a passing shadow on the luminous calm of the single universal Spirit: to the latter, intelligence is a temporary result of the motions of Matter. The idealist can give no satisfactory explanation of the existence of the shadow; he admits that it is inexplicable, a thing that is and yet is not: the materialist can give no satisfactory explanation of the existence of intelligence; he simply tries to trace the stages of its development and the methods of its workings, and covers over the want of an explanation by the abundant minuteness of his observations. But the soul of Man, looking out and in, is satisfied neither with Shankara nor with Haeckel. It sees the universal existence of phenomena, it sees the universal existence of Intelligence. It seeks a term which will admit both, cover both, identify both; it demands, not an elimination of either, but a reconcilement.

The Upanishads do not deny the reality of the world, but they identify it with Brahman who transcends it. He is the One without a second; He is the All. If all is Brahman, then there can be nothing but Brahman, and therefore the existence of the All, sarvam idam, does not contradict the unity of Brahman, does not establish the reality of bheda, difference. It is one Intelligence looking at itself from a hundred view-points, each point conscious of and enjoying the existence of the others. The shoreless stream of idea and thought, imagination and experience, name and form, sensation and vibration sweeps onward for ever, without beginning, without end, rising into view, sinking
out of sight; through it the one Intelligence with its million self-expressions pours itself abroad, an ocean with innumerable waves. One particular self-expression may disappear into its source and continent, but that does not and cannot abolish the phenomenal universe. The One is for ever, and the Many are for ever because the One is for ever. So long as there is a sea, there will be waves.

In the oceanic stir and change of universal Nature the soul or Purusha is the standing-point, stable, unmoving, unchanging, eternal, — \textit{nityaḥ sarvagataḥ sthānur acalo’yain sanātanaḥ}. In the whole, the Purusha or soul is one, — there is One Spirit which supports the stir of the Universe, not many. In the individual the One Purusha has three stages of personality; He is One, but triple, \textit{trivṛt}. The Upanishads speak of two birds on one tree, of which one eats the fruit of the tree, the other, seated on a higher branch, does not eat but watches its fellow; one is \textit{iśa} or lord of itself, the other is \textit{aniśa}, not lord of itself, and it is when the eater looks up and perceives the greatness of the watcher and fills himself with it that grief, death, subjection, — in one word \textit{māyā}, ignorance and illusion, ceases to touch him. There are two unborn who are male and one unborn who is female; she is the tree with its sweet and bitter fruit, the two are the birds. One of the unborn enjoys her sweetness, the other has put it away from him. These are the two Purushas, the \textit{akṣara}, or immutable spirit, and the \textit{kṣara}, or apparently mutable, and the tree or woman is Prakriti, universal Energy which the Europeans call Nature. The \textit{kṣara puruṣa} is the soul in Nature and enjoying Nature, the \textit{akṣara puruṣa} is the soul above Nature and watching her. But there is One who is not seated on the tree but occupies and possesses it, who is not only lord of Himself, but lord of all that is: He is higher than the \textit{kṣara}, higher than the \textit{akṣara}, He is Purushottama, the Soul one with God, with the All.

These three Purushas are described in the fifteenth chapter of the Gita. “There are two Purushas in the world, the \textit{akṣara} and the \textit{kṣara}, — the \textit{kṣara} is all creatures, the \textit{akṣara} is called \textit{kūṭastha}, the one on the summit. There is another Purusha, the highest (\textit{uttama}), called also the Paramatma or Supreme Spirit,
who enters into the three worlds, (the worlds of suṣupti, svapna, jāgrat, otherwise the causal, mental and physical planes of existence), and sustains them as their imperishable lord.” And in the thirteenth chapter, while drawing the distinction between the lower Purusha and the higher, Sri Krishna defines more minutely the relations of God and the individual soul to Nature. “Prakriti is the basic source of cause, effect and agency; the Purusha, of the sense of enjoyment of happiness and grief; for it is the soul in Nature (Purusha in Prakriti) that enjoys the threefold workings of things caused by Nature, (the play of conservation, creation and destruction; reception, reaction and resistance; illumination, misconception and obscuration; calm, work and inertia; all being different manifestations of three fundamental forces called the gunas or essential properties of Prakriti), and it is the attachment of the soul to the gunas that is the cause of births in bodies good and evil. The highest Purusha in this body is the one who watches, who sanctions, who enjoys, who upholds, who is the mighty Lord and the Supreme Soul.”

The personality of the Supreme Soul is universal, not individual. Whatever is in all creatures, character, idea, imagination, experience, sensation, motion, is contained by Him as an object of spiritual enjoyment without limiting or determining Him. He is all things at once. Such a universality is necessary to support and supply individual existence, but it cannot be the determining limit of individual existence. Something has to be reserved, something put forward, and this partial manifestation is the individual. “It is verily an eternal part of Me that in the world of individual existence becomes the Jiva or individual.” The Jiva or individual is ks.ara puru.s, and between him and the Supreme stands the aks.ara puru.s, the bird on the summit of the tree, joyous in his own bliss, undisturbed by the play of Nature, impartially watching it, receiving its images on his calm immovable existence without being for a moment bound or affected, eternally self-gathered, eternally free. This aks.ara puru.s is our real self, our divine unity with God, our inalienable freedom from that which is transient and changing. If it did not exist, there would be no escape from the bondage of life and
death, joy and grief, sin and virtue; we should be prisoners in a cage without a door, beating our wings against the bars in vain for an exit; life and death, joy and grief, sin and virtue would be eternal, ineffugable realities, not temporary rules determining the great game of life, and we should be unwilling actors, not free playmates of God able to suspend and renew the game when we will. It is by realising our oneness with the akṣara puruṣa that we get freedom from ignorance, freedom from the cords of desire, freedom from the imperative law of works. On the other hand if the akṣara puruṣa were all, as the Sankhya philosophy contends, there would be no basis for different experience, no varying personality, every individual existence would be precisely like every other individual existence, the development and experience of one soul in Nature an exact replica of the development and experience of another soul. It is the kṣara puruṣa who is all creatures, and the variety of experience, character and development is effected by a particular part of the universal swabhava or nature of conscious existence in phenomena being attached to a particular individual or Jiva. This is what is meant by saying that it is a part of God which becomes the Jiva. This swabhava, once determined, does not change; but it manifests various parts of itself, at various times, under various circumstances, in various forms of action and various bodies suited to the action or development it has to enjoy. It is for this reason that the Purusha in Nature is called kṣara, fluid, shifting, although it is not in reality fluid or shifting, but constant, eternal and immutable, sanātana. It is the variety of its enjoyment in Time, Space and Causality that makes it kṣara. The enjoyment of the akṣara puruṣa is self-existent, beyond Time, Space and Causality, aware of but undisturbed by the continual multitudinous flux and reflux of Prakriti. The enjoyment of Purushottama is both in Prakriti and beyond it, it embraces and is the reality of all experience and enjoyment.

Development is determined by the kṣara puruṣa, but not conducted by him. It is Prakriti, the Universal Energy, that conducts development under the law of cause and effect, and is the
The soul is not the agent, but the lord who enjoys the results of the action of his agent, Prakriti or Nature; only by his attachment to Prakriti he forgets himself and identifies himself with her so as to have the illusion of agency and, by thus forgetting himself, ceases to be lord of himself, becomes subject to Causality, imprisoned in Time and Space, bound by the work which he sanctions. He himself, being a part of God, is made in His image, of one nature with Him. Therefore what God is, he also is, only with limitation, subject to Time, Space and Causality, because he has, of his own will, accepted that bondage. He is the witness, and if he ceased to watch, the drama would stop. He is the source of sanction, and what he declares null and void, drops away from the development. He is the enjoyer, and if he became indifferent, that individual development would be arrested. He is the upholder, and if he ceased to sustain the ādāra, the vehicle, it would fall and cease. He is the lord, and it is for his pleasure that Nature acts. He is the spirit, and matter is only his vehicle, his robe, his means of self-expression. But all his sanctions, refusals, behests act not at once, not there and then, not by imperative absolute compulsion, but subject to lapse of time, change of place, working of cause to effect. The lapse may be brief or long, a moment or centuries; the change small or great, here or in another world; the working direct or indirect, with the rapid concentration of processes which men call a miracle or with the careful and laboured evolution in which every step is visibly ordered and deliberate; but so long as the Jiva is bound, his lordship is limited and constitutional, not despotic and absolute. His sanction and signature are necessary, but it is the Lords spiritual and temporal of his mind and body, the Commons in his external environment who do the work of the State, execute, administer, legislate.

The first step in self-liberation is to get rid of the illusion of agency, to realise that Nature acts, not the soul. The second is to remove the siege of phenomenal associations by surrendering lordship to God, leaving Him alone to uphold and sanction by the abdication of one’s own independent use of these powers, offering up the privilege of the enjoyer to Him. All that is then
left is the attitude of the akṣara puruṣa, the free, blissful self-existence, watching the action of Prakriti, but outside it. The kṣara withdraws into the akṣara. When the sākṣi or witness withdraws into God Himself, that is the utter liberation.
The Strength of Stillness

There are two great forces in the universe, silence and speech. Silence prepares, speech creates. Silence acts, speech gives the impulse to action. Silence compels, speech persuades. The immense and inscrutable processes of the world all perfect themselves within, in a deep and august silence, covered by a noisy and misleading surface of sound — the stir of innumerable waves above, the fathomless resistless mass of the ocean’s waters below. Men see the waves, they hear the rumour and the thousand voices and by these they judge the course of the future and the heart of God’s intention; but in nine cases out of ten they misjudge. Therefore it is said that in History it is always the unexpected that happens. But it would not be the unexpected if men could turn their eyes from super®cies and look into substance, if they accustomed themselves to put aside appearances and penetrate beyond them to the secret and disguised reality, if they ceased listening to the noise of life and listened rather to its silence.

The greatest exertions are made with the breath held in; the faster the breathing, the more the dissipation of energy. He who in action can cease from breathing, — naturally, spontaneously, — is the master of Prana, the energy that acts and creates throughout the universe. It is a common experience of the Yogin that when thought ceases, breathing ceases, — the entire kumbhak effected by the Hathayogin with infinite trouble and gigantic effort, establishes itself easily and happily, — but when thought begins again, the breath resumes its activity. But when the thought flows without the resumption of the inbreathing and outbreathing, then the Prana is truly conquered. This is a law of Nature. When we strive to act, the forces of Nature do their will with us; when we grow still, we become their master. But there are two kinds of stillness — the helpless stillness of
inertia, which heralds dissolution, and the stillness of assured sovereignty which commands the harmony of life. It is the sovereign stillness which is the calm of the Yogan. The more complete the calm, the mightier the yogic power, the greater the force in action.

In this calm, right knowledge comes. The thoughts of men are a tangle of truth and falsehood, satyam and anr.tam. True perception is marred and clouded by false perception, true judgment lamed by false judgment, true imagination distorted by false imagination, true memory deceived by false memory. The activity of the mind must cease, the chitta be purified, a silence fall upon the restlessness of Prakriti, then in that calm, in that voiceless stillness illumination comes upon the mind, error begins to fall away and, so long as desire does not stir again, clarity establishes itself in the higher stratum of the consciousness compelling peace and joy in the lower. Right knowledge becomes the infallible source of right action.

Yogah karmasu kauÂsalam.

The knowledge of the Yogan is not the knowledge of the average desire-driven mind. Neither is it the knowledge of the scientific or of the worldly-wise reason which anchors itself on surface facts and leans upon experience and probability. The Yogan knows God’s way of working and is aware that the improbable often happens, that facts mislead. He rises above reason to that direct and illuminated knowledge which we call vijÄnÅnam. The desire-driven mind is emmeshed in the intricate tangle of good and evil, of the pleasant and the unpleasant, of happiness and misfortune. It strives to have the good always, the pleasant always, the happiness always. It is elated by fortunate happenings, disturbed and unnerved by their opposite. But the illuminated eye of the seer perceives that all leads to good; for God is all and God is sarvamaÇngalam. He knows that the apparent evil is often the shortest way to the good, the unpleasant indispensable to prepare the pleasant, misfortune the condition of obtaining a more perfect happiness. His intellect is delivered from enslavement to the dualities.

Therefore the action of the Yogan will not be as the action of the ordinary man. He will often seem to acquiesce in evil,
to avoid the chance of relieving misfortune, to refuse his assent to the efforts of the noble-hearted who withstand violence and wickedness; he will seem to be acting piśācavat. Or men will think him jāda, inert, a stone, a block, because he is passive, where activity appears to be called for; silent, where men expect voicefulness; unmoved, where there is reason for deep and passionate feeling. When he acts, men will call him unmattā, a madman, eccentric or idiot; for his actions will often seem to have no definite result or purpose, to be wild, unregulated, regardless of sense and probability or inspired by a purpose and a vision which is not for this world. And it is true that he follows a light which other men do not possess or would even call darkness; that what is a dream to them, is to him a reality; that their night is his day. And this is the root of the difference that, while they reason, he knows.

To be capable of silence, stillness, illuminated passivity is to be fit for immortality — amṛtātvāya kalpate. It is to be dhīra, the ideal of our ancient civilisation, which does not mean to be tamasic, inert and a block. The inaction of the tamasic man is a stumbling-block to the energies around him, the inaction of the Yogin creates, preserves and destroys; his action is dynamic with the direct, stupendous driving-power of great natural forces. It is a stillness within often covered by a ripple of talk and activity without, — the ocean with its lively surface of waves. But even as men do not see the reality of God’s workings from the superficial noise of the world and its passing events, for they are hidden beneath that cover, so also shall they fail to understand the action of the Yogin, for he is different within from what he is outside. The strength of noise and activity is, doubtless, great, — did not the walls of Jericho fall by the force of noise? But infinite is the strength of the stillness and the silence, in which great forces prepare for action.
The Principle of Evil

The problem of evil is one that has taxed human thought and evolved various and conflicting solutions. To the rationalist who does not believe in anything not material, the problem does not exist. Everything is in nature as the result of evolution. Nature is blind and unintelligent and has therefore no conception of good or evil; the conception belongs to the human mind and is the result of the social sense and the ideas of pleasure and pain developed in human beings by a perfectly intelligible natural process. It is to men who believe in Intelligence as governing and developing the world that the problem exists. Why did evil come into existence and what is its purpose?

The unwillingness of the devout soul to admit that evil can have its existence in God, has led to variations of the Manichean theory which sees a double control in the world, God as the Principle of good and Satan as the Principle of evil. Those who regard the belief in the existence of an intelligent evil power as superstition, find the origin of evil in man who abuses his freedom and by his revolt and self-will gives birth to sin. This solution solves nothing, for it does not explain why there should have been a possibility of evil at all. Unless we limit our conception of God as the source and creator of all, that from which all proceeds, we must admit that evil as part of the economy of the world must have proceeded from Him no less than good. Even if we violently posit another creative force in the world limiting His universality, we shall have to assume that He, having the power to prevent evil, permits it; for He is omnipotent, and none can do anything except by the permission of His all-wise and overruling Providence. And if we limit the omnipotence of God, we reduce Him to a mere Demiurgus, a great Artificer of things struggling amongst forces over which He has not entire
control. Such a conception is unphilosophical and contrary to the universal spiritual experience of mankind. The problem remains why, if He is God, All-Love, sarvamaṅgalam, He creates evil or, if He does not create it, permits it.

To our mind there is no escaping from the belief that, if God exists, He is All. All proceeds from Him; from what other source can it proceed? All exists in Him; in what other being or continent can it exist? Therefore evil must proceed from Him, evil must exist in Him. Since He is All-Wise, for all knowledge is His, it must exist for some wise and perfect purpose. Since He is All-Love, it must exist for good and not for anything which contradicts the good. Only, His is an infinite wisdom, ours a finite, His perfect, ours undeveloped. His is an infinite and all-wise love, ours a finite and unwise love, a love imperfectly informed by knowledge, full of māyā, attachment to passing happiness and pleasure. God's love looks beyond, ours fixes its eyes on the moment.

Experience must always be the basis of true knowledge, but it must be experience illuminated by true perception, not experience dominated by surface impressions. The experience of the mind which has compassed calm and is able to preserve its tranquility under the most strenuous assaults of pain, misfortune and evil, is alone worth having. The mind which is not dhīra, which feels grief and thinks under the influence of affection and passion, even if it be noble affection and passion, cannot arrive at the samyag jñānam, the complete and perfect truth. Emotion is for the heart, it should not besiege the intellect; for the proper business of the intellect is to observe and understand, not to be obscured by the slightest prejudice, the least trace of feeling. One who is dhīra will look narrowly at every incident and, if he cannot see at once, wait for enlightenment as to its ultimate purpose and issue; so waiting, so calmly considering, the meaning of life dawns on the mind, an infinite purpose reveals itself in things small and great, in occurrences good and bad: omniscient Providence reveals itself in the fall of the sparrow and the death of the ant as well as in the earthquake that destroys great cities and the floods that make thousands destitute and homeless. Rudra and
Shiva reveal themselves as one. The Yogin sees God in all things, not only in all beings but in all events. He is the flood, He is the earthquake, He is Death that leads to a higher life, He is Pain that prepares us for a higher bliss. This is a thing that cannot be argued; it has to be seen. Paripaśyanti dhāro. And sight is only possible to the calm heart and the unperturbed understanding.

The materialist is not wrong when he holds good and evil to be merely operations of Nature which she uses impartially and without making a distinction, and that the distinction is an evolution in the human mind. Evil is good disintegrating to prepare for a higher good. That which is now tyranny, was once necessary to consolidate human society. What was once an ideal state of society, would now be barbarous and evil. Morality progresses, religion widens with the growing manifestation of that which is divine in the human race. As with the individual, so with the race and the world, evil tends to good, it comes into existence in order that men may reject the lesser good and rise to the higher.

The problem of pain remains. Was it necessary that the process should be accompanied with pain to the individual? At one time the capacity for pain, physical and mental, was infinitely less than it is now, so little that it might be pronounced to be nil. It is a remarkable fact that disease, pain and grief have grown keener with the growing fineness of the human organisation. Obviously this can only be a temporary development necessary to prepare a higher race which shall rise above pain to a higher capacity for pleasure and happiness. The lower organisation resisted the saṃskāra of pain and grief by the coarseness of its composition, it rejected pain in the sense of not knowing it. The higher organisation of the future will not be below it, but rise above it. It was the knowledge of good and evil that brought grief and sin into the world; when that knowledge is surmounted, man will rise above grief and sin. Before he ate the forbidden fruit, he had the innocence of the animal; when he shall cease to eat it, he will have the innocence of the God. Is it not so that in nature pain is a possibility which has to be exhausted and man has been selected as the instrument to bring it into existence, in a limited
space, for a limited time, and work it out of the cosmos? In the light of this idea the Christian doctrine of the Son of Man on the cross acquires a new significance and man himself becomes the Christ of the universe.

Another question occurs. Is pain real or a shadow? The Vedantist believes that the soul is a part of God or one with God Himself, and cannot feel pain or grief, but only ānanda, bliss. The jīva or soul takes the rasa, the delight of the dualities, and it changes to bliss in his nature; but this is veiled by the ignorance and separates the jīva in his svarūpa from the mind and the heart. Pain is a negative vikāra or corruption of true experience in the mind, pleasure a positive vikāra. The truth is ānanda. But this is a knowledge for which mankind is not ready. Only the Yogin realises it and becomes sama, like-minded to pain and pleasure, good or evil, happiness or misfortune. He takes the rasa of both and they give him strength and bliss; for the veil between his mind and his soul is removed and the apparent man in him has become one with the svarūpa or real man. If mankind as a whole came too early by that knowledge, the evolution of the perfect good would be delayed. The utter sweetness of dayā and prema, pity and love, might never be extracted from the līlā.
The Stress of the Hidden Spirit

THE WORLD is a great game of hide and seek in which the real hides behind the apparent, spirit behind matter. The apparent masquerades as real, the real is seen dimly as if it were an unsubstantial shadow. The grandeur of the visible universe and its laws enslaves men’s imaginations. “This is a mighty machine,” we cry, “but it moves of its own force and needs neither guide nor maker; for its motion is eternal.” Blinded by a half truth we fail to see that, instead of a machine without a maker, there is really only an existence and no machine. The Hindus have many images by which they seek to convey their knowledge of the relation between God and the world, but the idea of the machine does not figure largely among them. It is a spider and his web, a fire with many sparks, a pool of salt water in which every particle is penetrated by the salt. The world is a waking dream, an embodied vision, a mass of knowledge arranged in corporeal appearances expressing so many ideas which are each only a part of one unchanging truth. Everything becomes, nothing is made. Everything is put out from latency, nothing is brought into existence. Only that which was, can be, not that which was not. And that which is, cannot perish; it can only lose itself. All is eternal in the eternal spirit.

What was from of old? The spirit. What is alone? The spirit. What shall be for ever? The spirit. All that is in Space and Time, is He; and whatever there may be beyond Space and Time, that too is He. Why should we think so? Because of the eternal and invariable unity which gives permanence to the variability of the many. The sum of matter never changes by increase or diminution, although its component parts are continually shifting; so is it with the sum of energy in the world, so is it with the spirit. Matter is only so much mobile energy vibrating intensely into form. Energy is only so much spirit manifesting the motion that
we call energy. Spirit is Force, Spirit Existence,—matter and energy are only motions in Spirit. Force and Existence made one in Bliss, Sachchidanandam, this is the eternal reality of things. But that Force is not motion, it is Knowledge or Idea. Knowledge is the source of motion, not motion of knowledge. The Spirit therefore is all, It is alone. Idea or Force, Existence, Bliss are only its triune manifestations, existence implying idea which is force, force or idea implying bliss.

The Spirit manifest as Intelligence is the basis of the world. Spirit as existence, Sat, is one; as Intelligence it multiplies itself without ceasing to be one. We see that tree and say “Here is a material thing”; but if we ask how the tree came into existence, we have to say, it grew or evolved out of the seed. But growth or evolution is only a term describing the sequence in a process. It does not explain the origin or account for the process itself. Why should the seed produce a tree and not some other form of existence? The answer is, because that is its nature. But why is that its nature? Why should it not be its nature to produce some other form of existence, or some other kind of tree? That is the law, is the answer. But why is it the law? The only answer is that it is so because it is so; that it happens, why no man can say. In reality when we speak of Law, we speak of an idea; when we speak of the nature of a thing, we speak of an idea. Nowhere can we lay our hands on an object, a visible force, a discernible momentum and say “Here is an entity called Law or Nature.” The seed evolves a tree because tree is the idea involved in the seed; it is a process of manifestation in form, not a creation. If there were no insistent idea, we should have a world of chances and freaks, not a world of law—there would be no such idea as the nature of things, if there were not an originating and ordering intelligence manifesting a particular idea in forms. And the form varies, is born, perishes; the idea is eternal. The form is the manifestation or appearance, the idea is the truth. The form is phenomenon, the idea is reality.

Therefore in all things the Hindu thinker sees the stress of the hidden spirit. We see it as Prajna, the universal Intelligence, conscious in things unconscious, active in things inert.
The energy of Prajna is what the Europeans call Nature. The tree does not and cannot shape itself, the stress of the hidden Intelligence shapes it. He is in the seed of man and in that little particle of matter carries habit, character, types of emotion into the unborn child. Therefore heredity is true; but if Prajna were not concealed in the seed, heredity would be false, inexplicable, impossible. We see the same stress in the mind, heart, body of man. Because the hidden spirit urges himself on the body, stamps himself on it, expresses himself in it, the body expresses the individuality of the man, the developing and conscious idea or varying type which is myself; therefore no two faces, no two expressions, no two thumb impressions even are entirely alike; every part of the body in some way or other expresses the man. The stress of the spirit shows itself in the mind and heart; therefore men, families, nations have individuality, run into particular habits of thought and feeling, therefore also they are both alike and dissimilar. Therefore men act and react, not only physically but spiritually, intellectually, morally on each other, because there is one self in all creatures expressing itself in various idea and forms variously suitable to the idea. The stress of the hidden Spirit expresses itself again in events and the majestic course of the world. This is the Zeitgeist, this is the purpose that runs through the process of the centuries, the changes of the suns, this is that which makes evolution possible and provides it with a way, means and a goal. “This is He who from years sempiternal hath ordered perfectly all things.”

This is the teaching of the Vedanta as we have it in its oldest form in the Upanishads. Adwaita, Vishishtadwaita, Dwaita are merely various ways of looking at the relations of the One to the Many, and none of them has the right to monopolise the name Vedanta. Adwaita is true, because the Many are only manifestations of the One. Vishishtadwaita is true because ideas are eternal and having manifested, must have manifested before and will manifest again,—the Many are eternal in the One, only they are sometimes manifest and sometimes unmanifest. Dwaita is true, because although from one point of view the One and the Many are eternally and essentially the same, yet,
from another, the idea in its manifestation is eternally different from the Intelligence in which it manifests. If Unity is eternal and unchangeable, duality is persistently recurrent. The Spirit is infinite, illimitable, eternal, and infinite, illimitable, eternal is its stress towards manifestation filling endless space with innumerable existences.
Part Two

The Yoga and Its Objects

Circa 1912
The Yoga and Its Objects

The Yoga we practise is not for ourselves alone, but for the Divine; its aim is to work out the will of the Divine in the world, to effect a spiritual transformation and to bring down a divine nature and a divine life into the mental, vital and physical nature and life of humanity. Its object is not personal Mukti, although Mukti is a necessary condition of the yoga, but the liberation and transformation of the human being. It is not personal Ananda, but the bringing down of the divine Ananda — Christ’s kingdom of heaven, our Satyayuga — upon the earth. Of mokṣa we have no personal need; for the soul is nityamukta and bondage is an illusion. We play at being bound, we are not really bound. We can be free when God wills; for he, our supreme Self, is the master of the game, and without his grace and permission no soul can leave the game. It is often God’s will in us to take through the mind the bhoga of ignorance, of the dualities, of joy and grief, of pleasure and pain, of virtue and sin, of enjoyment and renunciation: for long ages, in many countries, he never even thinks of the yoga but plays out this play century after century without wearying of it. There is nothing evil in this, nothing which we need condemn or from which we need shrink, — it is God’s play. The wise man is he who recognises this truth and knowing his freedom, yet plays out God’s play, waiting for his command to change the methods of the game.

The command is now. God always keeps for himself a chosen country in which the higher knowledge is through all chances and dangers, by the few or the many, continually preserved, and for the present, in this Chaturyuga at least, that country is India. Whenever he chooses to take the full pleasure of ignorance, of the dualities, of strife and wrath and tears and weakness and selfishness, the tamasic and rajasic pleasures, of the play of the Kali in short, he dims the knowledge in India and puts her down
into weakness and degradation so that she may retire into herself and not interfere with this movement of his Lila. When he wants to rise up from the mud and Narayana in man to become once again mighty and wise and blissful, then he once more pours out the knowledge on India and raises her up so that she may give the knowledge with its necessary consequences of might, wisdom and bliss to the whole world. When there is the contracted movement of knowledge, the yogins in India withdraw from the world and practise yoga for their own liberation and delight or for the liberation of a few disciples; but when the movement of knowledge again expands and the soul of India expands with it, they come forth once more and work in the world and for the world. Yogins like Janaka, Ajatashatru and Kartavirya once more sit on the thrones of the world and govern the nations.

God's Lila in man moves always in a circle, from Satyayuga to Kali and through Kali to the Satya, from the Age of Gold to the Age of Iron and back again through the Iron to the Gold. In modern language the Satyayuga is a period of the world in which a harmony, stable and sufficient, is created and man realises for a time, under certain conditions and limitations, the perfection of his being. The harmony exists in its nature, by the force of a settled purity; but afterwards it begins to break down and man upholds it, in the Treta, by force of will, individual and collective; it breaks down further and he attempts to uphold it in the Dwapara by intellectual regulation and common consent and rule; then in the Kali it finally collapses and is destroyed. But the Kali is not merely evil; in it the necessary conditions are progressively built up for a new Satya, another harmony, a more advanced perfection. In the period of the Kali which has passed, still endures in its effects, but is now at an end, there has been a general destruction of the ancient knowledge and culture. Only a few fragments remain to us in the Vedas, Upanishads and other sacred works and in the world's confused traditions. But the time is at hand for a first movement upward, the first attempt to build up a new harmony and perfection. That is the reason why so many ideas are abroad for the perfection of human society,
knowledge, religion and morals. But the true harmony has not yet been found.

It is only India that can discover the harmony, because it is only by a change — not a mere readjustment — of man’s present nature that it can be developed, and such a change is not possible except by yoga. The nature of man and of things is at present a discord, a harmony that has got out of tune. The whole heart and action and mind of man must be changed, but from within, not from without, not by political and social institutions, not even by creeds and philosophies, but by realisation of God in ourselves and the world and a remoulding of life by that realisation. This can only be effected by Purnayoga, a yoga not devoted to a particular purpose, even though that purpose be Mukti or Ananda, but to the fulfilment of the divine humanity in ourselves and others. For this purpose the practices of Hatha and Raja Yoga are not sufficient and even the Trimarga will not serve; we must go higher and resort to the Adhyatmayoga. The principle of Adhyatmayoga is, in knowledge, the realisation of all things that we see or do not see but are aware of, — men, things, ourselves, events, gods, titans, angels, — as one divine Brahman, and in action and attitude, an absolute self-surrender to the Paratpara Purusha, the transcendent, infinite and universal Personality who is at once personal and impersonal, finite and infinite, self-limiting and illimitable, one and many, and informs with his being not only the Gods above, but man and the worm and the clod below. The surrender must be complete. Nothing must be reserved, no desire, no demand, no opinion, no idea that this must be, that cannot be, that this should be and that should not be; — all must be given. The heart must be purified of all desire, the intellect of all self-will, every duality must be renounced, the whole world seen and unseen must be recognised as one supreme expression of concealed Wisdom, Power and Bliss, and the entire being given up, as an engine is passive in the hands of the driver, for the divine Love, Might and perfect Intelligence to do its work and fulfil its divine Lila. Ahaṅkāra must be blotted out in order that we may have, as God intends us ultimately to have, the perfect bliss, the perfect calm and knowledge and the perfect activity of
the divine existence. If this attitude of perfect self-surrender can be even imperfectly established, all necessity of Yogic *kriyā* inevitably ceases. For then God himself in us becomes the sadhaka and the siddha and his divine power works in us, not by our artificial processes, but by a working of Nature which is perfectly informed, all-searching and infallibly efficient. Even the most powerful Rajayogic *samāyama*, the most developed *prānāyāma*, the most strenuous meditation, the most ecstatic Bhakti, the most self-denying action, mighty as they are and efficacious, are comparatively weak in their results when set beside this supreme working. For those are all limited to a certain extent by our capacity, but this is illimitable in potency because it is God's capacity. It is only limited by his will which knows what is best for the world and for each of us in the world and apart from it.

The first process of the yoga is to make the *sānkalpa* of *ātmasamarpaṇa*. Put yourself with all your heart and all your strength into God's hands. Make no conditions, ask for nothing, not even for *siddhi* in the yoga, for nothing at all except that in you and through you his will may be directly performed. To those who demand from him, God gives what they demand, but to those who give themselves and demand nothing, he gives everything that they might otherwise have asked or needed and in addition he gives himself and the spontaneous boons of his love.

The next process is to stand aside and watch the working of the divine power in yourself. This working is often attended with disturbance and trouble in the system, therefore faith is necessary, though perfect faith is not always possible at once; for whatever impurity is in you, harboured openly or secretly lurking, is likely to rise at first and be repeated so long as it is not exhaustively swept out, and doubt in this age is an almost universal impurity. But even when doubt assails, stand by and wait for it to pass, availing yourself if possible of the *satsaṅga* of those who are already advanced on the path, but when that is absent, still holding fast to the principle of the yoga, self-surrender. When distressed within or assailed from without, remember the words of the Gita,
By giving thyself up in heart and mind to Me, thou shalt cross over all difficulties and perils by My grace,” and again,

“Abandon all dharmas (all law, rule, means and codes of every kind whether formed by previous habit and belief or imposed from outside) and take refuge in Me alone; I will deliver thee from all sin and evil,—do not grieve.” “I will deliver”, —you have not to be troubled or struggle yourself as if the responsibility were yours or the result depended on your efforts, a mightier than you is busy with the matter. Neither disease nor calamity nor the rising of sin and impurity in you should cause any alarm. Hold fast only to him. “I will deliver thee from all sin and evil.”

But the release does not come by a sudden miracle, it comes by a process of purification and these things are a part of the process. They are like the dust that rises in clouds when a room long uncleaned is at last swept out. Though the dust seem to choke you, yet persevere, mā śucaḥ.

In order to stand aside, you must know yourself as the Purusha who merely watches, consents to God’s work, holds up the Adhar and enjoys the fruits that God gives. The work itself is done by God as Shakti, by Kali, and is offered up by her as a Yajna to Sri Krishna; you are the Yajamana who sees the sacrifice done, whose presence is necessary to every movement of the sacrifice and who tastes its results. This separation of yourself, this renunciation of the kartrtva-abhimāna (the idea of yourself as the doer) is easier if you know what the Adhar is. Above the buddhi which is the highest function of mind is the higher buddhi, or vijnāna, the seat of the satyadharma, truth of knowledge, truth of bhāva, truth of action, and above this ideal faculty is the ānanda or cosmic bliss in which the divine part of you dwells. It is of this vijnāna and this ānanda that Christ spoke as the kingdom of God that is within you.
We at present are awake, jāgrat, in the lower movements but suṣūpta, fast asleep, in the vijñāna and ānanda; we have to awaken these levels of consciousness within us and their awaking and unmingled activity is the siddhi of the yoga. For when that happens, we gain the condition of being which is called in the Gita dwelling in God, of which Sri Krishna speaks when he says, mayi nivāsiṣyasyeṣa, “Verily thou shalt dwell in Me.” Once it is gained, we are free and blessed and have everything towards which we strive.

The third process of the yoga is to perceive all things as God. First, as a rule, in the process of knowledge one comes to see pervading all space and time one divine impersonal Existence, Sad Atman, without movement, distinction or feature, śāntam alaksanam, in which all names and forms seem to stand with a very doubtful or a very minor reality. In this realisation the One may seem to be the only reality and everything else Maya, a purposeless and inexplicable illusion. But afterwards, if you do not stop short and limit yourself by the impersonal realisation, you will come to see the same Atman not only containing and supporting all created things, but informing and filling them, and eventually you will be able to understand that even the names and forms are Brahman. You will then be able to live more and more in the knowledge which the Upanishads and the Gita hold up as the rule of life; you will see the Self in all existing things and all existing things in the Self, ātmānāṁ sarvabhitēṣu sarvabhūtāṁ caṁtman; you will be aware of all things as Brahman, sarvaṁ khalvidam brahma. But the crowning realisation of this yoga is when you become aware of the whole world as the expression, play or Lila of an infinite divine personality, when you see in all, not the impersonal Sad Atman which is the basis of manifest existence, — although you do not lose that knowledge, — but Sri Krishna who at once is, bases and transcends all manifest and unmanifest existence, avyakto ’vyaktāṁ parah. For behind the Sad Atman is the silence of the Asat which the Buddhist Nihilists realised as the śūnyam and beyond that silence is the Paratpara Purusha (puruṣo vareṇya ādityavarnaṁ tamasah parastāṁ). It is he who has made this world out of his
being and is immanent in and sustains it as the infinite-finite Ishwara, ananta and sānta, Shiva and Narayana, Sri Krishna the Lilamaya who draws all of us to him by his love, compels all of us by his masteries and plays his eternal play of joy and strength and beauty in the manifold world.

The world is only a play of his being, knowledge and delight, sat, cit and ānanda. Matter itself, you will one day realise, is not material, it is not substance but form of consciousness, guṇa, the result of quality of being perceived by sense-knowledge. Solidity itself is only a combination of the guṇas, sāṁbati and dhriti, cohesion and permanence, a state of conscious being, nothing else. Matter, life, mind and what is beyond mind, it is all Sri Krishna the Ananta-guna Brahman playing in the world as the Sachchidananda. When we have this realisation, when we dwell in it securely and permanently, all possibilities of grief and sin, fear, delusion, internal strife and pain are driven puissantly from our being. We realise in our experience the truth of the Upanishads,

आनन्दे ब्रह्मणो विद्वान् न विभेदित कर्षन ||

“He who possesses the delight of the Brahman has no fear from anything in the world,” and that other in the Isha Upanishad,

यत्तमेव भूलानि आत्मावाभूत विज्ञानात् ||
तत्र कि मोहः कः शोकेकत्वमन्युषयत्॥

“When all created things become one with a man’s self by his getting the knowledge (vijñāna), thereafter what bewilderment can he have or what grief, when in all things he sees their oneness?” The whole world then appears to us in a changed aspect, as an ocean of beauty, good, light, bliss, exultant movement on a basis of eternal strength and peace. We see all things as śūbha, śiva, maṅgala, ānandamaya. We become one in soul with all beings, sarvabhūtātma-bhūtātma, and, having steadfastly this experience, are able by contact, by oneness, by the reaching out of love, to communicate it to others, so that we become a centre
of the radiation of this divine state, brāhmaṇī sthiti, throughout our world.

It is not only in things animate but in things inanimate also that we must see Narayana, experience Shiva, throw our arms around Shakti. When our eyes, that are now blinded by the idea of Matter, open to the supreme Light, we shall find that nothing is inanimate, but all contains, expressed or unexpressed, involved or evolved, secret or manifest or in course of manifestation, not only that state of involved consciousness which we call annam or Matter, but also life, mind, knowledge, bliss, divine force and being,—prâna, manas, vijnâna, ânanda, cit, sat. In all things the self-conscious personality of God broods and takes the delight of his guṇas. Flowers, fruits, earth, trees, metals, all things have a joy in them of which you will become aware, because in all Sri Krishna dwells, praviśya, having entered into them, not materially or physically,—because there is no such thing, Space and Time being only conventions and arrangements of perception, the perspective in God’s creative Art,—but by cit, the divine awareness in his transcendent being.

“All this world and every object in this world of Prakriti has been created as a habitation for the Lord.”

Nor is it enough to see him in all things and beings, sarva-bhûteṣu; you must see him in all events, actions, thoughts, feelings, in yourself and others, throughout the world. For this realisation two things are necessary: first, that you should give up to him the fruit of all your actions, secondly, that you should give up to him the actions themselves. Giving up the fruits of action does not mean that you must have the vairâgya for the fruits, turn away from them or refuse to act with a given end before you. It means that you must act, not because you want this or that to happen or think it necessary that this or that should happen and your action needed to bring it about, but because it is kartavyam, demanded by the Master of your being and must be done with whatever result God is pleased to give.
You must put aside what you want and wish to know what God wants; distrust what your heart, your passions or your habitual opinions prefer to hold as right and necessary, and passing beyond them, like Arjuna in the Gita, seek only to know what God has set down as right and necessary. Be strong in the faith that whatever is right and necessary will inevitably happen as the result of your due fulfilment of the \textit{kartavya\textasciitilde karma}, even if it is not the result that you preferred or expected. The power that governs the world is at least as wise as you and it is not absolutely necessary that you should be consulted or indulged in its management; God is seeing to it.

But what is the \textit{kartavya\textasciitilde karma}? It is very difficult to say, — \textit{gahan\textasciitilde karmano gatih}. Most people would translate \textit{kartavya\textasciitilde karma} by the English word and idea, duty; if asked to define it, they would say it is the right and moral action, what people understand by right and morality, what you yourself conscientiously think to be right or else what the good of society, the nation or mankind demands of you. But the man who remains bound by these personal or social ideas of duty, necessary as they are for the ignorant to restrain and tame their clamorous desires or their personal egoism, will be indeed what is called a good man, but he will never attain to the fulfilment of this yoga. He will only replace the desire for one kind of fruit by the desire for another kind; he will strive, even more passionately perhaps, for these higher results and be more bitterly grieved by not attaining them. There is no passion so terrible as the passion of the altruist, no egoism so hard to shake as the fixed egoism of virtue, precisely because it is justified in its own eyes and justified in the sight of men and cannot see the necessity for yielding to a higher law. Even if there is no grieving over the results, there will be the labour and strife of the rajasic \textit{kart\textasciitilde}, struggling and fighting, getting eager and getting exhausted, not \textit{trigun\textasciitilde tita}, always under bondage to the \textit{guna\textasciitilde}s.

It was under the domination of these ideas of personal virtue and social duty that Arjuna refused to fight. Against his reasonings Sri Krishna sets two different ideas, one inferior for the use of the man bound but seeking liberation, another superior
for the liberated man, the Shastra and surrender not only of the 
fruits of the work but of the work itself to God. The virtue of the 
Shastra is that it sets up a standard outside ourselves, different 
from our personal desires, reasonings, passions and prejudices, 
outside our selfishness and self-will, by living up to which in the 
right spirit we can not only acquire self-control but by reducing 
even the sattwic abāṅkāra to a minimum prepare ourselves for 
liberation. In the old days the Shastra was the Vedic Dharma 
based upon a profound knowledge of man’s psychology and the 
laws of the world, revealing man to himself and showing him 
how to live according to his nature; afterwards it was the law 
of the Smritis which tried to do the same thing more roughly 
by classifying men according to the general classes of which the 
Vedas speak, the cāturvarṇya; today it is little more than blind 
mechanical custom and habitual social observance, a thing not 
sattwic but tamasic, not a preparatory discipline for liberation, 
but a mere bondage.

Even the highest Shastra can be misused for the purposes 
of egoism, the egoism of virtue and the egoism of prejudice 
and personal opinion. At its best it is a great means towards 
the preparation of liberation. It is śabda-brahma. But we must 
not be satisfied with mere preparation, we must, as soon as 
our eyes are opened, hasten on to actual freedom. The liber-
ated soul and the sadhak of liberation who has surrendered 
even his actions to God, gets beyond the highest Shastra, 
śabdabrahmaparvartate.

The best foundation for the surrender of action is the real-
isation that Prakriti is doing all our actions at God’s command 
and God through our svabhāva determines the action. From that 
moment the action belongs to him, it is not yours nor the respon-
sibility yours; there is indeed no responsibility, no bondage of 
Karma, for God has no responsibility, but is in every way master 
and free. Our actions become not only like the Shastric man’s 
svabhāvaniyata, regulated by nature and therefore dharma, but 
the svabhāva itself is controlled like a machine by God. It is 
not easy for us, full as we are of the Sanskaras of ignorance, to 
arrive at this stage of knowledge, but there are three stages by
which it can be rapidly done. The first is to live in the spirit of the sloka,—

त्यया हृषिकेषा हृदि स्थितेन यथा नियुक्तत्त्वम् तथा करोणि।

“This according as I am appointed by Thee, O Hrishikesha! seated in my heart, so I act.” When this has entered into your daily life, it will be easier to accomplish the second stage and live in the knowledge of the Gita,

ईश्वरः सर्वभूतानां हृदेऽद्वेजः कालित।
आपत्तन्त्व सर्वभूतानि यन्त्रांहेतु दानि मायया॥

“God stands in the heart of all beings, whirling round all, as on a wheel, by the Maya of the three gunas.” You will then be able to perceive the action of the three gunas in you and watch the machinery at its work, no longer saying, tathā karomi, I do, but gunā vartanta eva, it is merely the gunas that work. One great difficulty in these stages, especially before you can distinguish the action of the gunas, is the perception of the impurity of the svabhāva, the haunting idea of sin and virtue. You must always remember that, since you have put yourself in God’s hands, he will work out the impurities and you have only to be careful, as you cannot be attached either to pāpa or punya, sin or virtue. For he has repeatedly given the abhaya vacana, the assurance of safety. “Pratijñānīhi,” he says in the Gita, “na me bhaktah praṇāṣyati, he who is devoted to Me cannot perish.”

The third stage comes out of the second, by full realisation of God, or of itself by the grace of God. Not only will the Purusha stand apart and be trigunāṭita, beyond the three guṇas, but the Prakriti, though using the guṇas, will be free from their bondage. Sattwa, as we know it, will disappear into pure prakāśa and jyotiḥ, and the nature will live in a pure, free and infinite self-existing illumination. Tamas, as we know it, will disappear into pure sama or sānti, and the nature will take its firm stand on an infinite and ineffable rest and peace. Rajas, as we know it, will disappear into pure tapas, and the nature will flow in
a free and infinite ocean of divine force. On that foundation of calm and in that heaven of light, action will occur as the spontaneous objective expression of God’s knowledge, which is one with God’s will. This is the condition of infinity, ānantya, in which this struggle of bound and limited sattwa, rajas and tamas is replaced by a mighty harmony of free prakāśa, tapas and āsama. And even before you reach that condition, on the way to it, you will find that some mighty force not your own, not situated in your body though possessing and occupying it, is thinking for you, feeling for you, acting for you, your very body as well as your mind and heart being moved by that force and not by yourself. You will enjoy that thought, feeling, action, but will neither possess nor be possessed by it,—karmāṇi pravilīyante, your actions will disappear without leaving in you mark or trace, as a wave disappears from the surface of the sea, as water falls from the lotus leaf. Your mind, heart, body will not be yours, but God’s; you yourself will be only a centre of being, knowledge and bliss through which God works in that Adhar. This is the condition in which one is utterly taccittah, given up in all his conscious being to God, in which there is utter fulfilment of the description,

यस्य नाहंततो भावो क्षित्येत्य प निप्पने \n
“One whose state of being is free from egoism and whose understanding receives no stain.” This is the surrender of action to which Sri Krishna gives so much importance.

मथि सर्वाणि कर्माणि संन्यस्याभ्यामात्मचेतस ।
निरार्जी निरिन्नर्मे भूत्वा यद्यस्य विगतं ज्वरः ॥

“Laying down all actions upon Me, with thy whole conscious being in adhyātmayoga, become free from desire and the sense of belongings; fight, let the fever of thy soul pass from thee.” For this great and complete liberation it is necessary that you should be nīśprha, nirdvandva and nirahankāra, without the longing and reaching after things, free from the saṅskāra of the dualities
and free from egoism; for these three things are the chief enemies of self-surrender. If you are nirdvandva, you can be nihşprha, but hardly otherwise, for every dvandva creates in the mind by the very nature of the mind some form of rågadvesa, like and dislike, attraction and repulsion, whether they are the lowest dualities that appeal to the mind through the body, hunger and thirst, heat and cold, physical pleasure and pain, or the middle sorts that appeal to it through the feelings and desires, success and failure, victory and defeat, fortune and misfortune, pleasure and displeasure, joy and grief, hate and love, or the highest which appeal to the mind through the discriminating buddhi, virtue and sin, reason and unreason, error and truth. These things can only be put under our feet by complete knowledge, the knowledge that sees God in all things and thus comes to understand the relations of things to each other in his great cosmic purpose, by complete Bhakti which accepts all things with joy, — thus abolishing the dvandvas, — because they come from the Beloved or by perfect action offering up all works as a sacrifice to God with an entire indifference to these dualities of success, failure, honour, disgrace, etc., which usually pursue all Karma. Such knowledge, such Bhakti, such Karma come inevitably as the eventual result of the sankalpa of self-surrender and the practice of it.

But it is abanãkāra that by making the relation and effect of things on ourselves or on things connected with us the standard of life, makes the dvandvas a chain for our bondage. Abanãkāra in its action on our life and sadhana will be seen to be of three kinds, rajasic, tamasic and sattwic. Rajas binds by desire and the craving in the nature for occupation and activity, it is always reaching after action and the fruit of action; it is in order that we may be free from the rajasic abanãkāra that we have the command, “Do not do works from the desire of fruit,” mā karma-phala-hetur bhūḥ, and the command to give up our actions to God. Tamas binds by weakness and the craving in the nature for ease and inaction; it is always sinking into idleness, depression, confusion of mind, fear, disappointment, despondency and despair; it is in order that we may get rid of the tamasic
ahaṅkāra that we are given the command, “Let there be no attachment to inaction,” and the instruction to pursue the yoga always, whether we seem to advance or seem to be standing still or seem even to be going back, always with a calm faith and patient and cheerful perseverance, anirvinṇācetasā. Sattwa binds by knowledge and pleasure; it is always attaching itself to some imperfect realisation, to the idea of one’s own virtue, the correctness of one’s own opinions and principles or at its highest, as in the case of Arjuna, opposing some personal idea of altruism, justice or virtue against the surrender of our will that God demands of us. It is for the escape from the sattwic ahaṅkāra that we have to pass beyond the attachment to the duality of virtue and sin, ubhe sukrāduskrte.

Each of the guṇas working on the ahaṅkāra has its particular danger for the sadhak who has made the sañkalpa of self-surrender, but has not yet attained to the full accomplishment of the surrender. The danger of the rajoguṇa is when the sadhak is assailed by the pride that thinks, “I am a great sadhak, I have advanced so far, I am a great instrument in God’s hands,” and similar ideas, or when he attaches himself to the work as God’s work which must be carried out, putting himself into it and troubling himself about it as if he had more interest in God’s work than God himself and could manage it better. Many, while they are acting all the while in the spirit of rajasic ahaṅkāra, persuade themselves that God is working through them and they have no part in the action. This is because they are satisfied with the mere intellectual assent to the idea without waiting for the whole system and life to be full of it. A continual remembrance of God in others and renunciation of individual eagerness (spṛhā) are needed and a careful watching of our inner activities until God by the full light of self-knowledge, jñānādīpena bhāsvatā, dispels all further chance of self-delusion.

The danger of tamoguṇa is twofold, first, when the Purusha thinks, identifying himself with the tamas in him, “I am weak, sinful, miserable, ignorant, good-for-nothing, inferior to this man and inferior to that man, adhama, what will God do through me?” — as if God were limited by the temporary
capacities or incapacities of his instruments and it were not true that he can make the dumb to talk and the lame to cross the hills, mūkam karoṭi vācālam paṅguṇī laṅghayate girim,— and again when the sadhak tastes the relief, the tremendous relief of a negative ūṣanti and, feeling himself delivered from all troubles and in possession of peace, turns away from life and action and becomes attached to the peace and ease of inaction. Remember always that you too are Brahman and the divine Shakti is working in you; reach out always to the realisation of God's omnipotence and his delight in the Lila. He bids Arjuna work lokasaṅgrahārtha, for keeping the world together, for he does not wish the world to sink back into Prakriti, but insists on your acting as he acts,

उत्तराचर्यांच्या लोकांना कृपया करू न करू चेतने

“These worlds would be overpowered by tamas and sink into Prakriti if I did not do actions.” To be attached to inaction is to give up our action not to God but to our tamasic abhaṅkāra.

The danger of the sattvaguna is when the sadhak becomes attached to any one-sided conclusion of his reason, to some particular kriyā or movement of the sadhana, to the joy of any particular siddhi of the yoga, perhaps the sense of purity or the possession of some particular power or the Ananda of the contact with God or the sense of freedom and hungers after it, becomes attached to that only and would have nothing else. Remember that the yoga is not for yourself; for these things, though they are part of the siddhi, are not the object of the siddhi, for you have decided at the beginning to make no claim upon God but take what he gives you freely and, as for the Ananda, the selfless soul will even forego the joy of God's presence, when that is God's will. You must be free even from the highest sattwic abhaṅkāra, even from the subtle ignorance of mumukṣutva, the desire of liberation, and take all joy and delight without attachment. You will then be the siddha or perfect man of the Gita.

These then are the processes of the yoga, (1) the saṅkalpa of ātmasamarpaṇa, (2) the standing apart from the Adhar by self-
knowledge, (3) the vision of God everywhere and in all things and in all happenings, the surrender of the fruits of action and action itself to God, and the freedom thereby from ignorance, from abānkāra, from the dvandvas, from desire, so that you are śuddha, mukta, siddha, full of Ananda, pure, free, perfect and blissful in your being. But the processes will be worked out, once the sānkalpa is made, by God’s Shakti, by a mighty process of Nature. All that is indispensable on your part is the anumati and smṛti. Anumati is consent, you must give a temporary consent to the movements of the yoga, to all that happens inside or outside you as part of the circumstances of the sadhana, not exulting at the good, not fretting at the evil, not struggling in your heart to keep the one or get rid of the other, but always keeping in mind and giving a permanent assent to that which has to be finally effected. The temporary consent is passive submission to the methods and not positive acceptance of the results. The permanent consent is an anticipatory acceptance of the results, a sort of effortless and desireless exercise of will. It is the constant exercise of this desireless will, an intent aspiration and constant remembrance of the path and its goal which are the dhṛti and utsāha needed, the necessary steadfastness and zeal of the sadhak; ivākulaṭā or excited, passionate eagerness is more intense, but less widely powerful, and it is disturbing and exhausting, giving intense pleasure and pain in the pursuit but not so vast a bliss in the acquisition. The followers of this path must be like the men of the early yugas, dhīrāḥ, the great word of praise in the Upanishads. In the remembrance, the smṛti or smaraṇa, you must be apramatta, free from negligence. It is by the loss of the smṛti owing to the rush and onset of the guṇas that the yogin becomes bhrāṣṭa, falls from his firm seat, wanders from his path. But you need not be distressed when the pramāda comes and the state of fall or clouded condition seems to persist, for there is no fear for you of a permanent fall since God himself has taken entire charge of you and if you stumble, it is because it is best for you to stumble, as a child by frequent stumbling and falling learns to walk. The necessity of apramattatā disappears when you can replace the memory of the yoga and its objects by
the continual remembrance of God in all things and happenings, the nitya anusmarâna of the Gita. For those who can make the full surrender from the beginning there is no question; their path is utterly swift and easy.

It is said in the “Sanatsujatiya” that four things are necessary for siddhi — śâstra, utsâha, guru and kâla — the teaching of the path, zeal in following it, the Guru and time. Your path is that which I am pointing out, the utsâha needed is this anumati and this nitya smaranâ, the Guru is God himself and for the rest only time is needed. That God himself is the Guru, you will find when knowledge comes to you; you will see how every little circumstance within you and without you has been subtly planned and brought about by infinite wisdom to carry out the natural process of the yoga, how the internal and external movements are arranged and brought together to work on each other, so as to work out the imperfection and work in the perfection. An almighty love and wisdom are at work for your uplifting. Therefore never be troubled by the time that is being taken, even if it seems very long, but when imperfections and obstructions arise, be apramatta, dbîra, have the utsâha, and leave God to do the rest. Time is necessary. It is a tremendous work that is being done in you, the alteration of your whole human nature into a divine nature, the crowding of centuries of evolution into a few years. You ought not to grudge the time. There are other paths that offer more immediate results or at any rate, by offering you some definite kriyâ you can work at yourself, give your abânkâra the satisfaction of feeling that you are doing something, so many more prânâyâmas today, so much longer a time for the âsana, so many more repetitions of the japa, so much done, so much definite progress marked. But once you have chosen this path, you must cleave to it. Those are human methods, not the way that the infinite Shakti works, which moves silently, sometimes imperceptibly to its goal, advances here, seems to pause there, then mightily and triumphantly reveals the grandiose thing that it has done. Artificial paths are like canals hewn by the intelligence of man; you travel easily, safely, surely, but from one given place to another. This path is the broad and trackless ocean by
which you can travel widely to all parts of the world and are admitted to the freedom of the infinite. All that you need are the ship, the steering-wheel, the compass, the motive-power and a skilful captain. Your ship is the Brahmavidya, faith is your steering-wheel, self-surrender your compass, the motive-power is she who makes, directs and destroys the worlds at God's command and God himself is your captain. But he has his own way of working and his own time for everything. Watch his way and wait for his time. Understand also the importance of accepting the Shastra and submitting to the Guru and do not do like the Europeans who insist on the freedom of the individual intellect to follow its own fancies and preferences which it calls reasonings, even before it is trained to discern or fit to reason. It is much the fashion nowadays to indulge in metaphysical discussions and philosophical subtleties about Maya and Adwaita and put them in the forefront, making them take the place of spiritual experience. Do not follow that fashion or confuse yourself and waste time on the way by questionings which will be amply and luminously answered when the divine knowledge of the \textit{vijñāna} awakes in you. Metaphysical knowledge has its place, but as a handmaid to spiritual experience, showing it the way sometimes but much more dependent on it and living upon its bounty. By itself it is mere \textit{pāṇḍitīya}, a dry and barren thing and more often a stumbling-block than a help. Having accepted this path, follow its Shastra without unnecessary doubt and questioning, keeping the mind plastic to the light of the higher knowledge, gripping firmly what is experienced, waiting for light where things are dark to you, taking without pride what help you can from the living guides who have already trod the path, always patient, never hastening to narrow conclusions, but waiting for a more complete experience and a fuller light, relying on the Jagadguru who helps you from within.

It is necessary to say something about the Mayavada and the modern teachings about the Adwaita because they are much in the air at the present moment and, penetrated with ideas from European rationalism and agnosticism for which Shankara would have been astonished to find himself made responsible,
The Yoga and Its Objects

perplex many minds. Remember that one-sided philosophies are always a partial statement of truth. The world, as God has made it, is not a rigid exercise in logic but, like a strain of music, an infinite harmony of many diversities, and his own existence, being free and absolute, cannot be logically defined. Just as the best religion is that which admits the truth of all religions, so the best philosophy is that which admits the truth of all philosophies and gives each its right place. Maya is one realisation, an important one which Shankara overstressed because it was most vivid to his own experience. For yourself leave the word for subordinate use and fix rather on the idea of Lila, a deeper and more penetrating word than Maya. Lila includes the idea of Maya and exceeds it; nor has it that association of the vanity of all things, useless to you who have elected to remain and play with Sri Krishna in Mathura and Brindavan.

God is one but he is not bounded by his unity. We see him here as one who is always manifesting as many, not because he cannot help it, but because he so wills, and outside manifestation he is anirdeśyam, indefinable, and cannot be described as either one or many. That is what the Upanishads and other sacred books consistently teach; he is ekamevādvitīyam, One and there is no other, but also and consequently he is “this man, yonder woman, that blue-winged bird, this scarlet-eyed.” He is sānta, he is ananta; the Jiva is he. “I am the āsvattha tree,” says Sri Krishna in the Gita, “I am death, I am Agni Vaishwanara, I am the heat that digests food, I am Vyasa, I am Vasudeva, I am Arjuna.” All that is the play of his Caitanya in his infinite being, his manifestations, and therefore all are real. Maya means nothing more than the freedom of Brahman from the circumstances through which he expresses himself. He is in no way limited by that which we see or think about him. That is the Maya from which we must escape, the Maya of ignorance which takes things as separately existent and not God, not Caitanya, the illimitable for the really limited, the free for the bound. Do you remember the story of Sri Krishna and the Gopis, how Narada found him differently occupied in each house to which he went, present to each Gopi in a different body, yet always the same Sri Krishna? Apart from the
devotional meaning of the story, which you know, it is a good image of his World-Lila. He is sarva, everyone, each Purusha with his apparently different Prakriti and action is he, and yet at the same time he is the Purushottama who is with Radha, the Para Prakriti, and can withdraw all these into himself when he wills and put them out again when he wills. From one point of view they are one with him, from another one yet different, from yet another always different because they always exist, latent in him or expressed at his pleasure. There is no profit in disputing about these standpoints. Wait until you see God and know yourself and him and then debate and discussion will be unnecessary.

The goal marked out for us is not to speculate about these things, but to experience them. The call upon us is to grow into the image of God, to dwell in him and with him and be a channel of his joy and might and an instrument of his works. Purified from all that is asubha, transfigured in soul by his touch, we have to act in the world as dynamos of that divine electricity and send it thrilling and radiating through mankind, so that wherever one of us stands, hundreds around may become full of his light and force, full of God and full of Ananda. Churches, Orders, theologies, philosophies have failed to save mankind because they have busied themselves with intellectual creeds, dogmas, rites and institutions, with acaraśuddhi and darśana, as if these could save mankind, and have neglected the one thing needful, the power and purification of the soul. We must go back to the one thing needful, take up again Christ’s gospel of the purity and perfection of mankind, Mahomed’s gospel of perfect submission, self-surrender and servitude to God, Chaitanya’s gospel of the perfect love and joy of God in man, Ramakrishna’s gospel of the unity of all religions and the divinity of God in man, and, gathering all these streams into one mighty river, one purifying and redeeming Ganges, pour it over the death-in-life of a materialistic humanity as Bhagirath led down the Ganges and flooded with it the ashes of his fathers, so that they may be a resurrection of the soul in mankind and the Satyayuga for a while return to the world. Nor is this the whole object of the
Lila or the Yoga; the reason for which the Avatars descend is to raise up man again and again, developing in him a higher and ever higher humanity, a greater and yet greater development of divine being, bringing more and more of heaven again and again upon the earth until our toil is done, our work accomplished and Sachchidananda fulfilled in all even here, even in this material universe. Small is his work, even if he succeeds, who labours for his own salvation or the salvation of a few; infinitely great is his, even if he fail or succeed only partially or for a season, who lives only to bring about peace of soul, joy, purity and perfection among all mankind.
“Matter itself, you will one day realise, is not material, it is not substance but form of consciousness, *guna*, the result of quality of being perceived by sense-knowledge.” (p. 77)

There is no need to put “the” before “quality” — in English that would alter the sense. Matter is not regarded in this passage as a quality of being perceived by sense; I don’t think that would have any meaning. It is regarded as a result of a certain power and action of consciousness which presents forms of itself to sense perception and it is this quality of sense-perceivedness, so to speak, that gives them the appearance of Matter, i.e. of a certain kind of substantiality inherent in themselves — but in fact they are not self-existent substantial objects but forms of consciousness. The point is that there is no such thing as the self-existent Matter posited by nineteenth-century Science.

“chitta” and “chetas”

Chitta is ordinarily used for the mental consciousness in general, thought, feeling, etc. taken together with a stress now on one side or another, sometimes on the feelings as in *citta-pramāthi*, sometimes on the thought-mind — that is why I translated it [on p. 75 (*maccittah*)] “heart and mind” in its wider sense. Chetas can be used in the same way, but it has a different shade of sense, properly speaking, and can include also the movements of the soul, covering the whole consciousness even; [on p. 82] I take it in its most general sense. The translation is not meant

*Sri Aurobindo wrote these explanations in 1938 in answer to questions asked by a Hindi translator of The Yoga and Its Objects.*
to be literal but to render the thought in the line in its fullness. *Adhyātmacetasā* practically amounts to what in English we would describe as a spiritual consciousness.

“throw our arms around” (p. 78)

It is a figure meaning to comprehend in our consciousness with love and Ananda.

“the nature” (p. 81, lines 29, 31, 33)

Nature here means the parts of Prakriti in the human being: as it is the condition of the Prakriti that changes with shifting of the gunas and it is this condition of the Prakriti that will become illumined by the transformation of *sattva* into *jyotih*.

*lokesaṅgrahārthāya* (p. 85) — Does this mean present order?

No. It is in a more general sense the maintenance of the world order which may be a developing, not necessarily a stationary one, an order spiritual, moral etc. and not merely a social order.
Part Three

Writings from the *Arya*

1914–1921
A PHILOSOPHICAL REVIEW

(English Edition of the "Revue de Grande Synthèse.")

Editors:

SRI AUROBINDO GHOSE — PAUL & MIRRA RICHARD.

15th August 1914

7, Rue Dupleix, Pondicherry.

INDIA.

MODERN PRESS, PONDICHERY.
"ARYA"

MONTHLY REVIEW.

The "ARYA" is a Review of pure philosophy.
The object which it has set before itself is twofold:—
1. A systematic study of the highest problems of existence:
2. The formation of a vast Synthesis of knowledge, harmonising the diverse religious traditions of humanity occidental as well as oriental. Its method will be that of a realism, at once rational and transcendental,—a realism consisting in the unification of intellectual and scientific discipline with those of intuitive experience.

This Review will also serve as an organ for the various groups and societies founded on its inspiration.

The Review will publish:—

Synthetic studies in speculative Philosophy.
Translations and commentaries of ancient texts.
Studies in Comparative Religion.
Practical methods of inner culture and self development.

CONTENTS.

The Life Divine......................Aurobindo Ghose.
The Wherefore of the Worlds ........Paul Richard.
The Secret of the Veda..............A. G.
   a.) The Problem and its Solution.
   b.) Selected Hymns.
Annotated Texts: Isha Upaniṣad.....A. G.
The Synthesis of Yoga................A. G.
The Eternal Wisdom..................P. R.
Varieties: The Soul of a Plant.
The Question of the Month.
The News of the Month.
Notes on the *Arya*
The “Arya’s” Second Year

THE “ARYA”, born by a coincidence which might well have been entirely disastrous to its existence in the very month when there broke out the greatest catastrophe that has overtaken the modern world, has yet, though carried on under serious difficulties, completed its first year. We have been obliged unfortunately to discontinue the French edition from February last as our director M. Paul Richard was then recalled to join his class of the Reserve Army in France. We have to thank the indulgence of our French subscribers who have consented to receive the English edition in its stead.

We have been obliged in our first year for reasons we shall indicate in the preface to our August number¹ to devote the Review almost entirely to high philosophy and severe and difficult thinking. But the object we had in view is now fulfilled and we recognise that we have no right to continue to subject our readers to the severe strain of almost 64 pages of such strenuous intellectual labour. We shall therefore in the next year devote a greater part of our space to articles on less profound subjects written in a more popular style. Needless to say, our matter will always fall within the definition of a philosophical Review and centre around the fundamental thought which the “Arya” represents.

We shall continue the Life Divine, the Synthesis of Yoga and the Secret of the Veda; but we intend to replace the Selected Hymns by a translation of the Hymns of the Atris (the fifth Mandala of the Rig Veda) so conceived as to make the sense of the Vedic chants at once and easily intelligible without the aid of a

¹ The “preface” in question appeared under the title “Our Ideal”. The bulk of that piece is printed on pages 140–47. Passages referring to the Arya were omitted from it after its first publication; these are reproduced on pages 103–4. — Ed.
Notes on the Arya

commentary to the general reader. The same circumstance which obliged us to discontinue the French edition, will also prevent us from continuing the Wherefore of the Worlds. Happily, we have been able to bring it to a point where the writer’s central idea appears, the new creation of our world by redeeming Love, — a fitting point for the faith and reason of man to pause upon at the moment of the terrible ordeal which that world is now undergoing.

Without the divine Will which knows best what to use and what to throw aside, no human work can come to the completion hoped for by our limited vision. To that Will we entrust the continuance and the result of our labours and we conclude the first year of the “Arya” with the aspiration that the second may see the speedy and fortunate issue of the great world-convulsion which still pursues us and that by the Power which brings always the greatest possible good out of apparent evil there may emerge from this disastrous but long-foreseen collapse of the old order a new and better marked by the triumph of higher principles of love, wisdom and unity and a sensible advance of the race towards our ultimate goal, — the conscious oneness of the Soul in humanity and the divinity of man.
APPENDIX

Passages Omitted from “Our Ideal”

The “Arya” having completed its first year and survived the first perils of infancy, now offers itself a second time to the decisions of Time and the mind of the hour. We think it necessary to open our new year with a succinct statement of the idea this Review is intended to serve and the aim which it holds before it. For our Review has been conceived neither as a mirror of the fleeting interests and surface thoughts of the period we live in, nor as the mouthpiece of a sect, school or already organised way of thinking. Its object is to feel out for the thought of the future, to help in shaping its foundations and to link it to the best and most vital thought of the past.

*

Our first preoccupation in the “Arya” has therefore been with the deepest thought that we could command on the philosophical foundations of the problem; and we have been so profoundly convinced that without this basis nothing we could say would have any real, solid and permanent value that we have perhaps given too great a space to difficult and abstruse thought whether in the shaping of our own ideas or in the study and restatement of the ancient Eastern knowledge. Our excuse is that we come forward as ourselves learners and students and must begin at the roots to proceed forward safely.

These paragraphs formed part of the article “Our Ideal” when it was published in the Arya in August 1915 (one month after “The ‘Arya’s’ Second Year”). The passages occurred at the beginning of the essay and before its last paragraph. They were omitted from “Our Ideal” when it was included in the book Ideal and Progress in 1920.
Our second preoccupation has been with the psychological disciplines of Yoga; but here also we have been obliged to concern ourselves with a deep study of the principles underlying the methods rather than with a popular statement of methods and disciplines. But without this previous study of principles the statement of methods would have been unsound and not really helpful. There are no short cuts to an integral perfection.

Other and more popular sides of our work we have been obliged hitherto to neglect; but now that we have advanced a little in the more difficult part of it, we hope to turn increasingly to these more obvious and general subjects of interest. And if our readers are still willing to follow us, their recompense will be a more clear, sound and solid thought on these subjects than we could otherwise have given them.
The “Arya’s” Fourth Year

We close this month the fourth year of the “Arya”, and bring to a conclusion at the same time the “Psychology of Social Development”, the “Ideal of Human Unity” and the first series of the “Essays on the Gita”. A few more chapters will complete the “Life Divine”. We are therefore well in view of the completion of the first part of the work which we had proposed to ourselves in starting this philosophical monthly, and we take the opportunity to say a few words upon the principle which has governed our writing and which the difficulty of a serial exposition on several lines at a time, scattering and breaking up the total impression, may have prevented some of our readers from grasping in its entirety.

We had not in view at any time a review or magazine in the ordinary sense of the word, that is to say, a popular presentation or criticism of current information and current thought on philosophical questions. Nor was it, as in some philosophical and religious magazines in India, the restatement of an existing school or position of philosophical thought cut out in its lines and needing only to be popularised and supported. Our idea was the thinking out of a synthetic philosophy which might be a contribution to the thought of the new age that is coming upon us. We start from the idea that humanity is moving to a great change of its life which will even lead to a new life of the race,—in all countries where men think, there is now in various forms that idea and that hope,—and our aim has been to search for the spiritual, religious and other truth which can enlighten and guide the race in this movement and endeavour. The spiritual experience and the general truths on which such an attempt could be based, were already present to us, otherwise we should have had no right to make the endeavour at all; but the complete intellectual statement of them and their results and
issues had to be found. This meant a continuous thinking, a high and subtle and difficult thinking on several lines, and this strain, which we had to impose on ourselves, we were obliged to impose also on our readers. This too is the reason why we have adopted the serial form which in a subject like philosophy has its very obvious disadvantages, but was the only one possible.

Our original intention was to approach the synthesis from the starting-point of the two lines of culture which divide human thought and are now meeting at its apex, the knowledge of the West and the knowledge of the East; but owing to the exigencies of the war this could not be fulfilled. The “Arya” except for one unfinished series has been an approach to the highest reconciling truth from the point of view of the Indian mentality and Indian spiritual experience, and Western knowledge has been viewed from that standpoint. Here the main idea which has governed our writing, was imposed on us by the very conditions of the problem. All philosophy is concerned with the relations between two things, the fundamental truth of existence and the forms in which existence presents itself to our experience. The deepest experience shows that the fundamental truth is truth of the Spirit; the other is the truth of life, truth of form and shaping force and living idea and action. Here the West and East have followed divergent lines. The West has laid most emphasis on truth of life and for a time come to stake its whole existence upon truth of life alone, to deny the existence of spirit or to relegate it to the domain of the unknown and unknowable; from that exaggeration it is now beginning to return. The East has laid most emphasis on truth of the Spirit and for a time came, at least in India, to stake its whole existence upon that truth alone, to neglect the possibilities of life or to limit it to a narrow development or a fixed status; the East too is beginning to return from this exaggeration. The West is reawaking to the truth of the Spirit and the spiritual possibilities of life, the East is reawaking to the truth of Life and tends towards a new application to it of its spiritual knowledge. Our view is that the antinomy created between them is an unreal one. Spirit being the fundamental truth of existence, life can be only its manifestation; Spirit must
be not only the origin of life but its basis, its pervading reality and its highest and total result. But the forms of life as they appear to us are at once its disguises and its instruments of self-manifestation. Man has to grow in knowledge till they cease to be disguises and grow in spiritual power and quality till they become in him its perfect instruments. To grow into the fullness of the divine is the true law of human life and to shape his earthly existence into its image is the meaning of his evolution. This is the fundamental tenet of the philosophy of the “Arya”.

This truth had to be worked out first of all from the metaphysical point of view; for in philosophy metaphysical truth is the nucleus of the rest, it is the statement of the last and most general truths on which all the others depend or in which they are gathered up. Therefore we gave the first place to the “Life Divine”. Here we start from the Vedantic position, its ideas of the Self and mind and life, of Sachchidananda and the world, of Knowledge and Ignorance, of rebirth and the Spirit. But Vedanta is popularly supposed to be a denial of life, and this is no doubt a dominant trend it has taken. Though starting from the original truth that all is the Brahman, the Self, it has insisted in the end that the world is simply not-Brahman, not-Self; it has ended in a paradox. We have attempted on the contrary to establish from its data a comprehensive Adwaita. We have shown that mind and life and matter are derivations from the Self through a spiritual mind or supermind which is the real support of cosmic existence and by developing mind into that, man can arrive at the real truth of the spirit in the world and the real truth and highest law of life. The Self is Sachchidananda and there is no incurable antinomy between that and the world; only we see the world through the eyes of the Ignorance and we have to see it through the eyes of the Knowledge. Our ignorance itself is only knowledge developing out of its involution in the apparent nescience of Matter and on its way to a return to its conscious integrality. To accomplish that return and manifest the spiritual life in the human existence is the opportunity given by the successions of rebirth. We accept the truth of evolution, not so much in the physical form given to it by the West as
in its philosophical truth, the involution of life and mind and
spirit here in matter and their progressive manifestation. At the
summit of this evolution is the spiritual life, the life divine.

It was necessary to show that these truths were not inconsis-
tent with the old Vedantic truth, therefore we included explana-
tions from this point of view of the Veda, two of the Upanishads
and the Gita. But the Veda has been obscured by the ritualists
and the scholiasts. Therefore we showed in a series of articles,
initially only as yet, the way of writing of the Vedic mystics,
their system of symbols and the truths they figure. Among the
Upanishads we took the Isha and the Kena; to be full we should
have added the Taittiriya, but it is a long one and for it we had
no space. The Gita we are treating as a powerful application of
truth of spirit to the largest and most difficult part of the truth of
life, to action, and a way by which action can lead us to birth into
the Spirit and can be harmonised with the spiritual life. Truth of
philosophy is of a merely theoretical value unless it can be lived,
and we have therefore tried in the “Synthesis of Yoga” to arrive
at a synthetical view of the principles and methods of the various
lines of spiritual self-discipline and the way in which they can
lead to an integral divine life in the human existence. But this is
an individual self-development, and therefore it was necessary
to show too how our ideal can work out in the social life of
mankind. In the “Psychology of Social Development” we have
indicated how these truths affect the evolution of human society.
In the “Ideal of Human Unity” we have taken the present trend
of mankind towards a closer unification and tried to appreciate
its tendencies and show what is wanting to them in order that
real human unity may be achieved.

Our plan has compelled us to deal mainly with first prin-
ciples and work them out in their fullness. In future we do
not propose to start any other long series of this kind, but to
have more short articles with a broader, more direct and, as
far as possible, more popular treatment. We shall also permit
ourselves a freer range and diversity, so far as that is permissible
in a philosophical review.
On Ideals and Progress
On Ideals

IDEALS are truths that have not yet effected themselves for man, the realities of a higher plane of existence which have yet to fulfil themselves on this lower plane of life and matter, our present field of operation. To the pragmatical intellect which takes its stand upon the ever-changing present, ideals are not truths, not realities, they are at most potentialities of future truth and only become real when they are visible in the external fact as work of force accomplished. But to the mind which is able to draw back from the flux of force in the material universe, to the consciousness which is not imprisoned in its own workings or carried along in their flood but is able to envelop, hold and comprehend them, to the soul that is not merely the subject and instrument of the world-force but can reflect something of that Master-Consciousness which controls and uses it, the ideal present to its inner vision is a greater reality than the changing fact obvious to its outer senses. The Idea is not a reflection of the external fact which it so much exceeds; rather the fact is only a partial reflection of the Idea which has created it.

Certainly, ideals are not the ultimate Reality, for that is too high and vast for any ideal to envisage; they are aspects of it thrown out in the world-consciousness as a basis for the workings of the world-power. But they are primary, the actual workings secondary. They are nearer to the Reality and therefore always more real, forcible and complete than the facts which are their partial reflection. Reflections themselves of the Real, they again are reflected in the more concrete workings of our existence. The human intellect in proportion as it limits itself by the phenomena of self-realising Force fails to catch the creative Idea until after we have seen the external fact it has created; but this order of our sense-enslaved consciousness is not the real order of the universe. God pre-exists before the world can come
into being, but to our experience in which the senses act first and only then the finer workings of consciousness, the world seems to come first and God to emerge out of it, so much so that it costs us an effort to rise out of the mechanical, pluralistic and pantheistic conceptions of Him to a truer and higher idea of the Divine Reality. That which to us is the ultimate, is in truth the primary reality. So too the Idea which seems to us to rise out of the fact, really precedes it and out of it the fact has arisen. Our vulgar contrast of the ideal and the real is therefore a sensuous error, for that which we call real is only a phenomenon of force working out something that stands behind the phenomenon and that is pre-existent and greater than it. The Real, the Idea, the phenomenon, this is the true order of the creative Divinity.

The pragmatic intellect is only sure of a thing when it finds it realised in Power; therefore it has a certain contempt for the ideal, for the vision, because it drives always at execution and material realisation. But Power is not the only term of the Godhead; Knowledge is the elder sister of Power: Force and Consciousness are twin aspects of being both in the eternal foundation of things and in their evolutionary realisation. The idea is the realisation of a truth in Consciousness as the fact is its realisation in Power, both indispensable, both justified in themselves and in each other, neither warranted in ignoring or despising its complement. For the idealist and visionary to despise the pragmatist or for the pragmatist to depreciate the idealist and visionary is a deplorable result of our intellectual limitations and the mutual misunderstandings by which the arrogance of our imperfect temperament and mentality shuts itself out from perfection. It is as if we were to think that God the Seer and Knower must despise God the Master of works and energies or the Lord of action and sacrifice ignore the divine Witness and Originator. But these two are one and the division in us a limitation that mankind has yet to conquer.

The human being advances in proportion as he becomes more and more capable of knowing before he realises in action. This is indeed the order of evolution. It begins with a
material working in which the Prakriti, the executive Power, is veiled by its works, by the facts it produces, and itself veils the consciousness which originates and supports all its workings. In Life the force emerges and becomes vibrant in the very surface of its works; last, in Mind the underlying consciousness reveals itself. So too man is at first subject in his mentality to the facts which his senses envisage, cannot go behind and beyond them, knows only the impressions they make on his receptive mind. The animal is executive, not creative; a passive tool of Matter and Life he does not seek in his thought and will to react upon and use them: the human being too in his less developed state is executive rather than creative; he limits his view to the present and to his environment, works so as to live from day to day, accepts what he is without reaching forward in thought to what he may be, has no ideals. In proportion as he goes beyond the fact and seeks to anticipate Nature, to catch the ideas and principles behind her workings and finally to seize the idea that is not yet realised in fact and himself preside over its execution, he becomes originative and creative and no longer merely executive. He begins thus his passage from subjection to mastery.

In thus progressing humanity falls apart after its fashion into classes; it divides itself between the practical man and the idealist and makes numerous compromises between the two extremes. In reality the division is artificial; for every man who does anything in the world, works by virtue of an idea and in the force given to him by ideals, either his own or others’ ideals, which he may or may not recognise but in whose absence nevertheless he would be impotent to move a single step. The smaller the ideals, the fewer they are and the less recognised and insisted on, the less also is the work done and the progress realised; on the other hand, when ideals enlarge themselves, when they become forceful, widely recognised, when different ideals enter into the field, clash and communicate their thought and force to each other, then the race rises to its great periods of activity and creation. And it is when the Ideal arisen, vehement, energetic, refuses to be debarred from possession and throws
itself with all the gigantic force of the higher planes of existence on this reluctant and rebellious stuff of life and matter to conquer it that we have the great eras which change the world by carrying out the potentialities of several centuries in the action of a few decades.

Therefore wherever and whenever the mere practical man abounds and excludes or discourages by his domination the idealist, there is the least work and the least valuable work done in that age or country for humanity; at most some preliminary spade-work, some labour of conservation and hardly perceptible motion, some repression of creative energies preparing for a great future outburst. On the other hand, when the idealist is liberated, when the visionary abounds, the executive worker also is uplifted, finds at once an orientation and tenfold energy and accomplishes things which he would otherwise have rejected as a dream and chimera, which to his ordinary capacity would be impossible and which often leave the world wondering how work so great could have been done by men who were in themselves so little. The union of the great idealist with the great executive personality who receives and obeys the idea is always the sign of a coming realisation which will be more or less deep and extensive in proportion as they are united or as the executive man seizes more or less profoundly and completely the idea he serves and is able to make permanent in force what the other has impressed upon the consciousness of his age.

Often enough, even when these two different types of men work in the same cause and one more or less fulfils the other, they are widely separated in their accessory ideas, distrust, dislike and repudiate each other. For ordinarily the idealist is full of anticipations which reach beyond the actual possibilities or exceed the work that is destined to be immediately fulfilled; the executive man on the other hand is unable to grasp either all the meaning of the work he does or all its diviner possibilities which to him are illusion and vanity while to the other they are all that is supremely valuable in his great endeavour. To the practical worker limiting himself by patent forces and actual possibilities the idealist who made his work possible seems an idle dreamer...
or a troublesome fanatic; to the idealist the practical man who realises the first steps towards his idea seems a coarse spoiler of the divine work and almost its enemy: for by attaching too much importance to what is immediately possible he removes the greater possibilities which he does not see, seems to prevent and often does prevent a larger and nobler realised. It is the gulf between a Cavour and a Mazzini, between the prophet of an ideal and the statesman of a realisable idea. The latter seems always to be justified by the event, but the former has a deeper justification in the shortcomings of the event. The successes of the executive man hiding away the ideal under the accomplished fact are often the tragedies of the human spirit and are responsible for the great reactions and disappointments it undergoes when it finds how poor and soulless is the accomplished fact compared with the glory of the vision and the ardour of the effort.

It cannot be doubted which of these two opposites and complementaries is the most essential to success. Not only is the upheaval and fertilising of the general consciousness by the thinker and the idealist essential to the practical realisation of great changes, but in the realisation itself the idealist who will not compromise is an indispensable element. Show me a movement without a force of uncompromising idealism working somewhere in its sum of energies and you have shown me a movement which is doomed to failure and abortion or to petty and inconsiderable results. The age or the country which is entirely composed of reasonable, statesmanlike workers ever ready for concession and compromise is a country which will never be great until it has added to itself what is lacking to it and bathed itself in pure and divine fountains and an age which will accomplish nothing of supreme importance for the progress of humanity. There is a difference however between the fanatic of an idea and the true idealist: the former is simply the materialistic, executive man possessed by the idea of another, not himself the possessor of it; he is haunted in his will and driven by the force of the idea, not really illumined by its light. He does harm as well as good and his chief use is to prevent the
man of compromise from pausing at a paltry or abortive result; but his excesses also bring about great reactions. Incapable of taking his stand on the ideal itself, he puts all his emphasis on particular means and forms and overstrains the springs of action till they become dulled and incapable of responding to farther excitation. But the true idealist is not the servant of the letter or the form; it is the idea which he loves and the spirit behind the idea which he serves.

Man approaches nearer his perfection when he combines in himself the idealist and the pragmatist, the originative soul and the executive power. Great executive personalities have usually been men of a considerable idealism. Some indeed have served a purpose rather than an ideal; even in the idea that guided or moved them they have leaned to its executive rather than its inspiring and originative aspect; they have sought their driving force in the interest, passion and emotion attached to it rather than in the idea itself. Others have served consciously a great single thought or moral aim which they have laboured to execute in their lives. But the greatest men of action who were endowed by Nature with the most extraordinary force of accomplishment, have owed it to the combination in them of active power with an immense drift of originative thought devoted to practical realisation. They have been great executive thinkers, great practical dreamers. Such were Napoleon and Alexander. Napoleon with his violent prejudice against ideologues and dreamers was himself a colossal dreamer, an incurable if unconscious ideologist; his teeming brain was the cause of his gigantic force and accomplishment. The immense if shapeless ideas of Alexander threw themselves into the form of conquests, cities, cultures; they broke down the barriers of Greek and Asiatic prejudice and narrow self-imprisonment and created an age of civilisation and soul-interchange.

But these great personalities do not contain in themselves the combination which humanity most needs; not the man of action driven by ideas, the pragmatist stirred by a half-conscious exaltation from the idealistic, almost the mystic side of his nature, but the seer who is able to execute his vision is the higher term
of human power and knowledge. The one takes his stand in the
Prakriti, the executive Force, and is therefore rather driven than
leads himself even when he most successfully leads others; the
other takes his stand in the Purusha, the Knower who controls
executive force, and he possesses the power that he uses. He
draws nearer to the type of the divine Seer-Will that has created
and governs the universe. But such a combination is rare and
difficult; for in order to grasp the Ideal the human soul has to
draw back so far from the limitations, pettinesses, denials of the
world of phenomenal fact that the temperament and mentality
become inapt for executive action upon the concrete phenomena
of life and matter. The mastery of the fact is usually possible to
the idealist mind only when its idealism is of no great depth or
power and can therefore accommodate itself more easily to the
actual life-environment.

Until this difficulty is overcome and the Seer-Will becomes
more common in man and more the master of life, the ideal
works at a disadvantage, by a silent pressure upon the reluctant
world, by occasional attacks and sudden upheavals; a little is
accomplished in a long time or by a great and sudden effort,
a little that is poor enough, coarse enough, material enough
compared with the thing seen and attempted, but which still
makes a farther advance possible though often after a period of
quiescence and reaction. And times there are, ages of stupen-
dous effort and initiative when the gods seem no longer satisfied
with this tardy and fragmentary working, when the ideal breaks
constantly through the dull walls of the material practical life,
incalculable forces clash in its field, innumerable ideas meet and
wrestle in the arena of the world and through the constant storm
and flash, agitation of force and agitation of light the possibility
of the victoriously fulfilled ideal, the hope of the Messiah, the
expectation of the Avatar takes possession of the hearts and
thoughts of men. Such an age seems now to be coming upon the
world. But whether that hope and expectation and possibility
are to come to anything depends upon whether men prepare
their souls for the advent and rise in the effort of their faith, life
and thought to the height and purity of a clearly-grasped ideal.
The Messiah or Avatar is nothing but this, the divine Seer-Will descending upon the human consciousness to reveal to it the divine meaning behind our half-blind action and to give along with the vision the exalted will that is faithful and performs and the ideal force that executes according to the vision.
Yoga and Skill in Works

Yoga is skill in works.

_Gita_

YOGA, says the Gita, is skill in works, and by this phrase the ancient Scripture meant that the transformation of mind and being to which it gave the name of Yoga brought with it a perfect inner state and faculty out of which the right principle of action and the right spiritual and divine result of works emerged naturally like a tree out of its seed. Certainly, it did not mean that the clever general or politician or lawyer or shoemaker deserves the name of a Yogan; it did not mean that any kind of skill in works was Yoga, but by Yoga it signified a spiritual condition of universal equality and God-union and by the skill of the Yogic worker it intended a perfect adaptation of the soul and its instruments to the rhythm of the divine and universal Spirit in a nature liberated from the shackles of egoism and the limitations of the sense-mind.

Essentially, Yoga is a generic name for the processes and the result of processes by which we transcend or shred off our present modes of being and rise to a new, a higher, a wider mode of consciousness which is not that of the ordinary animal and intellectual man. Yoga is the exchange of an egoistic for a universal or cosmic consciousness lifted towards or informed by the supra-cosmic, transcendent Unnameable who is the source and support of all things. Yoga is the passage of the human thinking animal towards the God-consciousness from which he has descended. In that ascent we find many levels and stages, plateau after plateau of the hill whose summit touches the Truth of things; but at every stage the saying of the Gita applies in an ever higher degree. Even a little of this new law and inner order delivers the soul out of the great peril by which it had been
overtaken in its worldward descent, the peril of the ignorance
by which the unillumined intellect, even when it is keenest or
sagest, must ever be bound and limited, of the sorrow and sin
from which the unpurified heart, even when it wears the rich-
est purple of aspiration and feeling, must ever suffer soil and
wound and poverty, and of the vanity of its works to which
the undivinised will of man, even when it is most vehement and
powerful or Olympian and victorious, must eternally be subject.
It is the utility of Yoga that it opens to us a gate of escape out
of the vicious circle of our ordinary human existence.

The idea of works, in the thought of the Gita, is the widest
possible. All action of Nature in man is included, whether it
be internal or external, operate in the mind or use the body,
seem great or seem little. From the toil of the hero to the toil
of the cobbler, from the labour of the sage to the simple phys-
ical act of eating, all is included. The seeking of the Self by
thought, the adoration of the Highest by the emotions of the
heart, the gathering of means and material and capacity and
the use of them for the service of God and man stand here on
an equal footing. Buddha sitting under the Bo-tree and con-
quering the illumination, the ascetic silent and motionless in his
cave, Shankara storming through India, debating with all men
and preaching most actively the gospel of inaction are all from
this point of view doing great and forceful work. But while
the outward action may be the same, there is a great internal
difference between the working of the ordinary man and the
working of the Yogin,—a difference in the state of the being, a
difference in the power and the faculty, a difference in the will
and temperament.

What we do, arises out of what we are. The existent is
conscious of what he is; that consciousness formulates itself as
knowledge and power; works are the result of this twofold force
of being in action. Mind, life and body can only operate out of
that which is contained in the being of which they are forces.
This is what we mean when we say that all things act according
to their nature. The divine Existence is pure and unlimited being
in possession of all itself, it is sat; whatever it puts forth in
its limitless purity of self-awareness is truth of itself, satya; the
divine knowledge is knowledge of the Truth, the divine Will is
power of the Truth, the divine workings are words and ideas of
the Truth realising themselves in manifold forms and through
many stages and in infinite relations. But God is not limited or
bound by any particular working or any moment of time or any
field of space or any law of relation, because He is universal and
infinite. Nor is He limited by the universe; for His infinity is not
cosmic, but supracosmic.

But the individualised being is or acts as if he were so bound
and limited, because he treats the particular working of existence
that he is and the particular moment of time and field of space
in which it is actually operating and the particular conditions
which reign in the working and in the moment and in the field as
if they were self-existent realities and the binding truth of things.
Himself, his knowledge, his force and will, his relations with the
world and his fellows, his need in it and his desire from them he
treats as the sufficient truth and reality, the point of departure
of all his works, the central fact and law of his universe. And
from this egoistic error arises an all-vitiating falsehood. For the
particular, the individual can have no self-existence, no truth,
no valid force except in so far as it reflects rightly and relates
and conforms itself justly to the universal, to the all-being, the
all-knowledge, the all-will and follows its true drift towards self-
realisation and vast delight in itself. Therefore the salvation of
the individual lies in his universalising himself; and this is the
lesson which life tries always to teach him but the obstinate ego
is always unwilling to learn; for the universal is not any group
or extended ego, not the family, community, nation or even all
mankind, but an infinite far surpassing all these littlenesses.

Nor is the universalising of himself sufficient for liberation,
although certainly it will make him practically more free and in
his being nearer to the true freedom. To put himself in tune with
the universal is a step, but beyond the universal and directing
and determining it is the supracosmic Infinity; for the universe
also has no self-existence, truth or validity except as it expresses
the divine Being, Knowledge, Will, Power, Delight of Him who
surpasses all universe, so much that it can be said figuratively that with a petty fragment of His being and a single ray of His consciousness He has created all these worlds. Therefore the universalised mind must look up from its cosmic consciousness to the Supernal and derive from that all its sense of being and movement of works. This is the fundamental truth from which the Yogic consciousness starts; it helps the individual to universalise himself and then to transcend the cosmic formula. And this transformation acts not only on his status of being but on his active consciousness in works.

The Gita tells us that equality of soul and mind is Yoga and that this equality is the foundation of the Brahman-state, that high infinite consciousness to which the Yogin aspires. Now equality of mind means universality; for without universality of soul there may be a state of indifference or an impartial self-control or a well-governed equality of temperament, but these are not the thing that is meant. The equality spoken of is not indifference or impartiality or equability, but a fundamental oneness of attitude to all persons and all things and happenings because of the perception of all as the One. Such equality, it is erroneously thought, is incompatible with action. By no means; this is the error of the animal and the intellectual man who thinks that action is solely possible when dictated by his hopes, fears and passions or by the self-willed preferences of the emotion and the intellect justifying themselves by the illusions of the reason. That might be the fact if the individual were the real actor and not merely an instrument or secondary agent; but we know well enough, for Science and Philosophy assure us of the same truth, that the universal is the Force which acts through the simulacrum of our individuality. The individual mind, pretending to choose for itself with a sublime ignorance and disregard of the universal, is obviously working on the basis of a falsehood and by means of an error and not in the knowledge and the will of the Truth. It cannot have any real skill in works; for to start from a falsehood or half-truth and work by means of blunders and arrive at another falsehood or half-truth which we have immediately to change, and all the while to weep and struggle
and suffer and have no sure resting-place, cannot surely be called skill in works. But the universal is equal in all and therefore its determinations are not self-willed preferences but are guided by the truth of the divine will and knowledge which is unlimited and not subject to incapacity or error.

Therefore that state of the being by which the Yogin differs from the ordinary man, is that by which he rises from the foundation of a perfect equality to the consciousness of the one existence in all and embracing all and lives in that existence and not in the walls of his body or personal temperament or limited mind. Mind and life and body he sees as small enough things which happen and change and develop in his being. Nay, the whole universe is seen by him as happening within himself, not in his small ego or mind, but within this vast and infinite self with which he is now constantly identified. All action in the universe he sees as arising in this being, out of the divine Existence and under the stress of the divine Truth, Knowledge, Will and Power. He begins to participate consciously in its working and to see all things in the light of that divine truth and governance; and even when his own actions move on certain lines rather than others, he is not bound by them or shut to the truth of all the rest by his own passions and preferences, gropings and seekings and revolts. It is evident that such an increasing wideness of vision must mean an increasing knowledge. And if it be true that knowledge is power, it must mean also an increasing force for works. Certainly, it would not be so, if the Yogin continued to act by the light of his individual reason and imagination and will; for the intellect and all that depends on it can only work by virtue of rigid limitations and exclusive determinations. Accordingly, the continued activity of the unillumined intellect and its servants conflicts with the new state of consciousness and knowledge which arises out of this larger existence, and so long as they remain active, it cannot be perfect or assured; for the consciousness is being continually pulled down to the lower field of ego-habit by the claim of their narrow workings. But the Yogin ceases, progressively, to act by the choice of his intellectual or emotional nature. Another light dawns, another power and
presence intervenes, other faculties awake in the place of the old human-animal combination.

As the state of being changes, the will and temperament must necessarily be modified. Even from an early stage the Yogin begins to subordinate his personal will or it becomes naturally subordinate to the sense of the supreme Will which is attracting him upward. Ignorantly, imperfectly, blunderingly it moves at first, with many recoils and relapses into personal living and personal action, but in time it becomes more in tune with its Source and eventually the personal will merges upward and all ways into the universal and infinite and obeys implicitly the transcendent. Nor does this change and ascension and expanding mean any annihilation of the will-power working in the individual, as the intellectual man might imagine; but rather it increases it to an immense forcefulness while giving it an infinite calm and an eternal patience. The temperament also is delivered from all leash of straining and desire, from all urge of passion and pain of wilful self-delusion. Desire, even the best, turns always to limitation and obscuration, to some eager exclusive choice and pressure, to some insistent exclusion of what should not be excluded and impatient revolt against the divine denials and withholdings. It generates anger and grief and passion and obstinacy, and these bring about the soul's loss of its divine memory or steadfast consciousness of itself and its self-knowledge and its equal vision of the truth of things. Therefore desire and its brood are incompatible with skill in works and their persistence is the sign of an imperfect Yoga.

Not only must the will and fundamental knowledge-view of things change, but a new combination of faculties take the place of the old. For if the intellect is not to do all our mental work for us or to work at all in its unillumined state and if the will in the form of desires, wishes, intellectual preferences is not to determine and enforce our action, then it is clear that other powers of knowledge and will must awaken and either replace the intellect and the mental preference or illumine and guide the one and transform and dominate the other. Otherwise either the action may be nil or else its impulses mechanical and chaotic,
even if the static being is blissfully enlarged; for they will well up indeed out of the universal and not the personal, but out of the universal in its lower formula which permits the erratic action of the heart and mind, while the old personal will and reason will not be there to impose some light and order on their ill-connected impulsions. Such faculties and new combination of faculties can and do emerge and they are illuminations and powers that are in direct touch and harmony with the light and power of the Truth; therefore in proportion as they manifest and take hold of their functions, they must increase the force, subtlety and perfection of the Yogin’s skill in works.

But the greatest skill in works of Yoga is that which to the animal man seems its greatest ineptitude. For all this difficult attainment, the latter will say, may lead to anything you please, but we have to lose our personal life, abandon our personal objects, annul our personal will and pleasure and without these life cannot be worth living. Now the object of all skill in works must be evidently to secure the best welfare either of ourselves or of others or of all. The ordinary man calls it welfare to secure momentarily some transient object, to wade for it through a sea of grief and suffering and painful labour and to fall from it again still deeper into the same distressful element in search of a new transient object. The greatest cunning of Yoga is to have detected this cheat of the mind and its desires and dualities and to have found the way to an abiding peace, a universal delight and an all-embracing satisfaction, which can not only be enjoyed for oneself but communicated to others. That too arises out of the change of our being; for the pure truth of existence carries also in it the unalloyed delight of existence, they are inseparable in the status of the infinite. To use the figures of the Vedic seers, by Yoga Varuna is born in us, a vast sky of spiritual living, the divine in his wide existence and infinite truth; into that wideness Mitra rises up, Lord of Light and Love who takes all our activities of thought and feeling and will, links them into a divine harmony, charioteers our movement and dictates our works; called by this wideness and this harmony Aryaman appears in us, the Divine in its illumined power, uplifted force of being and all-judging
effective will; and by the three comes the indwelling Bhaga, the Divine in its pure bliss and all-seizing joy who dispels the evil dream of our jarring and divided existence and possesses all things in the light and glory of Aryaman’s power, Mitra’s love and light, Varuna’s unity. This divine Birth shall be the son of our works; and than creating this what greater skill can there be or what more practical and sovereign cunning?
Conservation and Progress

MANKIND thinks naturally in extremes or else reconciles by a patchwork and compromise. Whether he makes a fetish of moderation or surrenders himself to the enthusiasm of the single idea, the human being misses always truth of vision and the right pitch of action because instead of seeing, feeling and becoming in obedience to his nature like other animate existences he tries always to measure things by a standard he has set up in his intelligence. But it is the character of his intelligence that it finds it an easy task to distinguish and separate but is clumsy in combining. When it combines, it tends to artificialise and falsify. It feels at ease in pursuing a single idea to its logical consequences and in viewing things from a single standpoint; but to harmonise different ideas in action and to view the facts from different standpoints is contrary to its native impulse; therefore it does that badly, with an ill grace and without mastery. Oftenest it makes an incongruous patchwork rather than a harmony. The human mind is strong and swift in analysis; it synthesises with labour and imperfectly and does not feel at home in its syntheses. It divides, opposes and, placed between the oppositions it creates, becomes an eager partisan of one side or another; but to think wisely and impartially and with a certain totality is irksome and disgusting to the normal human being.

All human action as all human thought suffers from these disabilities. For it is seduced by a trenchant idea which it follows without proper attention to collateral issues, to necessary companion ideas, to the contrary forces in operation, or else it regards these merely as enemies, brands them as pure falsehood and evil and strives with more or less violence to crush them out of existence. Then it sees other ideas which it attempts to realise in turn, either adding them to its past notions and possessions
or else rejecting these entirely for the new light; it makes a fresh war and a new clearance and denies its past work in the interest of a future attainment. But it has also its repentances, its returns, its recalls and re-enthronings of banished gods and even of lifeless ghosts and phantoms to which it gives a temporary and false appearance of life. And on the way it has continually its doubts, scruples, hesitations, its portentous assumptions of a sage moderation and a gradual and cautious advance. But human moderation is usually a wiseacre and a botcher; it sews a patch of new velvet on old fustian or of new fustian on old velvet and admires its deplorable handiwork. And its cautious advance means an accumulation of shams, fictions and dead conventions till the burden of falsehood becomes too great for life to bear and a violent revolution is necessary to deliver the soul of humanity out of the immobilising cerements of the past. Such is the type of our progress; it is the advance of an ignorant and purblind but always light-attracted spirit, a being half-animal, half-god, stumbling forward through the bewildering jungle of its own errors.

This characteristic of human mentality shows itself in the opposition we create between conservation and progress. Nothing in the universe can really stand still because everything there is a mould of Time and the very essence of Time is change by a movement forward. It is true that the world’s movement is not in a straight line; there are cycles, there are spirals; but still it circles, not round the same point always, but round an ever advancing centre, and therefore it never returns exactly upon its old path and never goes really backward. As for standing still, it is an impossibility, a delusion, a fiction. Only the spirit is stable; the soul and body of things are in eternal motion. And in this motion there are the three determining powers of the past, future and present,—the present a horizontal and constantly shifting line without breadth between a vast realised infinity that both holds back and impels and a vast unrealised infinity that both repels and attracts.

The past is both a drag and a force for progress. It is all that has created the present and a great part of the force that is creating the future. For the past is not dead; its forms are
gone and had to go, otherwise the present would not have come into being: but its soul, its power, its essence lives veiled in the present and ever-accumulating, growing, deepening will live on in the future. Every human being holds in and behind him all the past of his own race, of humanity and of himself; these three things determine his starting-point and pursue him through his life's progress. It is in the force of this past, in the strength which its huge conservations give to him that he confronts the unillumined abysses of the future and plunges forward into the depths of its unrealised infinities. But also it is a drag, partly because man afraid of the unknown clings to the old forms of which he is sure, the old foundations which feel so safe under his feet, the old props round which so many of his attachments and associations cast their tenacious tendrils, but also partly because the forces of the past keep their careful hold on him so as to restrain him in his uncertain course and prevent the progress from becoming a precipitation.

The future repels us even while it irresistibly attracts. The repulsion lies partly in our own natural recoil from the unknown, because every step into this unknown is a wager between life and death; every decision we make may mean either the destruction or the greater fulfilment of what we now are, of the name and form to which we are attached. But also it lies in the future itself; for there, governing that future, there are not only powers which call us to fulfil them and attract us with an irresistible force but other powers which have to be conquered and do not desire to yield themselves. The future is a sphinx with two minds, an energy which offers itself and denies, gives itself and resists, seeks to enthrone us and seeks to slay. But the conquest has to be attempted, the wager has to be accepted. We have to face the future's offer of death as well as its offer of life, and it need not alarm us, for it is by constant death to our old names and forms that we shall live most vitally in greater and newer forms and names. Go on we must; for if we do not, Time itself will force us forward in spite of our fancied immobility. And this is the most pitiable and dangerous movement of all. For what can be more pitiable than to be borne helplessly forward
clinging to the old that disintegrates in spite of our efforts and shrieking frantically to the dead ghosts and dissolving fragments of the past to save us alive? And what can be more dangerous than to impose immobility on that which is in its nature mobile? This means an increasing and horrible rottenness; it means an attempt to persist on as a putrid and stinking corpse instead of a living and self-renewing energetic creature. The greatest spirits are therefore those who have no fear of the future, who accept its challenge and its wager; they have that sublime trust in the God or Power that guides the world, that high audacity of the human soul to wrestle with the infinite and realise the impossible, that wise and warrior confidence in its ultimate destiny which mark the Avatars and prophets and great innovators and renovators.

If we consider carefully we shall see that the past is indeed a huge force of conservation, but of conservation that is not immobile, but on the contrary offers itself as material for change and new realisation; that the present is the constant change and new actual realisation which the past desires and compels; and that the future is that force of new realisation not yet actual towards which the past was moving and for the sake of which it lived. Then we perceive that there is no real opposition between these three; we see that they are parts of a single movement, a sort of Trinity of Vishnu-Brahma-Maheshwara fulfilling by an inseparable action the one Deity. Yet the human mind in its mania of division and opposition seeks to set them at strife and ranges humanity into various camps, the partisans of the past, the partisans of the present, the partisans of the future, the partisans of all sorts of compromises between the three forces. Nature makes good use of the struggle between these partisans and her method is necessary in our present state of passionate ignorance and egoistic obstinacy; but none the less is it from the point of view of a higher knowledge a pitiably ignorant struggle.

The partisans of the future call themselves the party of progress, the children of light and denounce the past as ignorant, evil, a mass of errors and abuses; their view alone has the monopoly of the light, the truth, the good — a light, good and truth which will equally be denounced as error and evil by
succeeding generations. The partisans of the present look with horror upon all progress as an impious and abominable plunge into error and evil and degeneration and ruin; for them the present is the culmination of humanity, — as previous “present” times were for all the preceding generations and as the future which they abhor will be for these unprogressive souls if they should then reincarnate; they will then defend it with the same passion and asperity against another future as they now attack it in the interests of the present. The partisans of the past are of two kinds. The first admit the defects of the present but support it in so far as it still cherishes the principles of the high, perfect, faultless, adorable past, that golden age of the race or community, and because even if somewhat degenerate, its forms are a bulwark against the impiety of progress; if they admit any change, it is in the direction of the past that they seek it. A second kind condemn the present root and branch as degenerate, hateful, horrible, vicious, accursed; they erect a past form as the hope of a humanity returning to the wisdom of its forefathers. And to such quarrels of children the intellectuals and the leaders of thought and faith lend the power of the specious or moving word and the striking idea and the emotional fervour or religious ardour which they conceive to be the very voice and light and force of Truth itself in its utter self-revelation.

The true thinker can dispense with the éclat which attaches to the leader of partisans. He will strive to see this great divine movement as a whole, to know in its large lines the divine intention and goal in it without seeking to fix arbitrarily its details; he will strive to understand the greatness and profound meaning of the past without attaching himself to its forms, for he knows that forms must change and only the formless endures and that the past can never be repeated, but only its essence preserved, its power, its soul of good and its massed impulse towards a greater self-fulfilment; he will accept the actual realisations of the present as a stage and nothing more, keenly appreciating its defects, self-satisfied errors, presumptuous pretensions because these are the chief enemies of progress, but not ignoring the truth and good that it has gained; and he will sound the future
to understand what the Divine in it is seeking to realise, not only at the present moment, not only in the next generation, but beyond, and for that he will speak, strive, if need be battle, since battle is the method still used by Nature in humanity, even while all the while he knows that there is more yet beyond beside which, when it comes to light, the truth he has seized will seem erroneous and limited. Therefore he will act without presumption and egoism, knowing that his own errors and those which he combats are alike necessary forces in that labour and movement of human life towards the growing Truth and Good by which there increases shadowily the figure of a far-off divine Ideal.
The Conservative Mind and Eastern Progress

The arrival of a new radical idea in the minds of men is the sign of a great coming change in human life and society; it may be combated, the reaction of the old idea may triumph for a time, but the struggle never leaves either the thoughts and sentiments or the habits and institutions of the society as they were when it commenced. Whether it knows it or not, it has gone forward and the change is irretrievable. Either new forms replace the old institutions or the old while preserving the aspect of continuity have profoundly changed within, or else these have secured for themselves a period of greater rigidity, increasing corruption, progressive deterioration of spirit and waning of real force which only assures them in the future a more complete catastrophe and absolute disappearance. The past can arrive at the most at a partial survival or an euthanasia, provided it knows how to compromise liberally with the future.

The conservative mind is unwilling to recognise this law though it is observable throughout human history and we can easily cull examples with full hands from all ages and all climes; and it is protected in its refusal to see by the comparative rarity of rapid revolutions and great cataclysmal changes; it is blinded by the disguise which Nature so often throws over her processes of mutation. If we look casually at European history in this light the attention is only seized by a few conspicuous landmarks, the evolution and end of Athenian democracy, the transition from the Roman republic to the empire, the emergence of feudal Europe out of the ruins of Rome, the Christianisation of Europe, the Reformation and Renascence together preparing a new society, the French Revolution, the present rapid movement towards a socialistic State and the replacing of competition by organised cooperation. Because our view of European history is
chiefly political, we do not see the constant mutation of society and of thought in the same relief; but we can recognise two great cycles of change, one of the ancient races leading from the primitive ages to the cultured society of the Graeco-Roman world, the other from the semi-barbarism of feudal Christendom to the intellectual, materialistic and civilised society of modern times.

In the East, on the contrary, the great revolutions have been spiritual and cultural; the political and social changes, although they have been real and striking, if less profound than in Europe, fall into the shade and are apt to be overlooked; besides, this unobtrusiveness is increased by their want of relief, the slow subtlety of their process and the instinctive persistence and reverence with which old names and formulas have been preserved while the thing itself was profoundly modified until its original sense remained only as a pious fiction. Thus Japan kept its sacrosanct Mikado as a cover for the change to an aristocratic and feudal government and has again brought him forward in modern times to cover and facilitate without too serious a shock the transition from a mediaeval form of society into the full flood of modernism. In India the continued fiction of the ancient fourfold order of society based on spiritual idealism, social type, ethical discipline and economic function is still used to cover and justify the quite different, complex and chaotic order of caste which, while it still preserves some confused fragments of the old motives, is really founded upon birth, privilege, local custom and religious formalism. The evolution from one type of society to another so opposed to it in its psychological motives and real institutions without any apparent change of formula is one of the most curious phenomena in the social history of mankind and still awaits intelligent study.

Our minds are apt to seize things in the rough and to appreciate only what stands out in bold external relief; we miss the law of Nature’s subtleties and disguises. We can see and fathom to some extent the motives, necessities, process of great revolutions and marked changes and we can consider and put in their right place the brief reactions which only modified without actually
preventing the overt realisation of new ideas. We can see for instance that the Sullan restoration of Roman oligarchy, the Stuart restoration in England or the brief return of monarchy in France with the Bourbons were no real restorations, but a momentary damming of the tide attended with insufficient concessions and forced developments which determined, not a return to the past, but the form and pace of the inevitable revolution. It is more difficult but still possible to appreciate the working of an idea against all obstacles through many centuries; we can comprehend now, for instance, that we must seek the beginnings of the French Revolution, not in Rousseau or Mirabeau or the blundering of Louis XVI, but in movements which date back to the Capet and the Valois, while the precise fact which prepared its tremendous outbreak and victory and determined its form was the defeat of the Calvinistic reformation in France and the absolute triumph of the monarchical system over the nobility and the bourgeoisie in the reigns of Louis XIII and Louis XIV. That double victory determined the destruction of the monarchy in France, the downfall of the Church and, by the failure of the nobles to lead faithfully the liberal cause whether in religion or politics, the disappearance of aristocracy.

But Nature has still more subtle and disguised movements in her dealings with men by which she leads them to change without their knowing that they have changed. It is because she has employed chiefly this method in the vast masses of the East that the conservative habit of mind is so much stronger there than in the West. It is able to nourish the illusion that it has not changed, that it is immovably faithful to the ideas of remote forefathers, to their religion, their traditions, their institutions, their social ideals, that it has preserved either a divine or an animal immobility both in thought and in the routine of life and has been free from the human law of mutation by which man and his social organisations must either progress or degenerate but can in no case maintain themselves unchanged against the attack of Time. Buddhism has come and gone and the Hindu still professes to belong to the Vedic religion held and practised by his Aryan forefathers; he calls his creed the Aryan dharma,
On Ideals and Progress

the eternal religion. It is only when we look close that we see the magnitude of the illusion. Buddha has gone out of India indeed, but Buddhism remains; it has stamped its giant impress on the spirit of the national religion, leaving the forms to be determined by the Tantricism with which itself had made alliance and some sort of fusion in its middle growth; what it destroyed no man has been able to restore, what it left no man has been able to destroy. As a matter of fact, the double cycle which India has described from the early Vedic times to India of Buddha and the philosophers and again from Buddha to the time of the European irruption was in its own way as vast in change religious, social, cultural, even political and administrative as the double cycle of Europe; but because it preserved old names for new things, old formulas for new methods and old coverings for new institutions and because the change was always marked in the internal but quiet and unobtrusive in the external, we have been able to create and preserve the fiction of the unchanging East. There has also been this result that while the European conservative has learned the law of change in human society, knows that he must move and quarrels with the progressist only over the right pace and the exact direction, the Eastern or rather the Indian conservative still imagines that stability may be the true law of mortal being, practices a sort of Yogic āsana on the flood of Time and because he does not move himself, thinks — for he keeps his eyes shut and is not in the habit of watching the banks — that he can prevent the stream also from moving on.

This conservative principle has its advantages even as rapid progress has its vices and its perils. It helps towards the preservation of a fundamental continuity which makes for the longevity of civilisations and the persistence of what was valuable in humanity’s past. So, in India, if religion has changed immensely its form and temperament, the religious spirit has been really eternal, the principle of spiritual discipline is the same as in the earliest times, the fundamental spiritual truths have been preserved and even enriched in their contents and the very forms can all be traced back through their mutations to the seed of the Veda. On the other hand this habit of mind leads to the
accumulation of a great mass of accretions which were once valuable but have lost their virtue and to the heaping up of dead forms and shibboleths which no longer correspond to any vital truth nor have any understood and helpful significance. All this putrid waste of the past is held to be too sacred to be touched by any profane hand and yet it chokes up the streams of the national life or corrupts its waters. And if no successful process of purification takes place, a state of general ill-health in the social body supervenes in which the principle of conservation becomes the cause of dissolution.

The present era of the world is a stage of immense transformations. Not one but many radical ideas are at work in the mind of humanity and agitate its life with a vehement seeking and effort at change; and although the centre of the agitation is in progressive Europe, yet the East is being rapidly drawn into this churning of the sea of thought and this breaking up of old ideas and old institutions. No nation or community can any longer remain psychologically cloistered and apart in the unity of the modern world. It may even be said that the future of humanity depends most upon the answer that will be given to the modern riddle of the Sphinx by the East and especially by India, the hoary guardian of the Asiatic idea and its profound spiritual secrets. For the most vital issue of the age is whether the future progress of humanity is to be governed by the modern economic and materialistic mind of the West or by a nobler pragmatism guided, uplifted and enlightened by spiritual culture and knowledge. The West never really succeeded in spiritualising itself and latterly it has been habituated almost exclusively to an action in the external governed by political and economic ideals and necessities; in spite of the reawakening of the religious mind and the growth of a widespread but not yet profound or luminous spiritual and psychical curiosity and seeking, it has to act solely in the things of this world and to solve its problems by mechanical methods and as the thinking political and economic animal, simply because it knows no other standpoint and is accustomed to no other method. On the other hand the East, though it has allowed its spirituality
to slumber too much in dead forms, has always been open to profound awakenings and preserves its spiritual capacity intact, even when it is actually inert and uncreative. Therefore the hope of the world lies in the re-arousing in the East of the old spiritual practicality and large and profound vision and power of organisation under the insistent contact of the West and in the flooding out of the light of Asia on the Occident, no longer in forms that are now static, effete, unadaptive, but in new forms stirred, dynamic and effective.

India, the heart of the Orient, has to change as the whole West and the whole East are changing, and it cannot avoid changing in the sense of the problems forced upon it by Europe. The new Orient must necessarily be the result either of some balance and fusion or of some ardent struggle between progressive and conservative ideals and tendencies. If therefore the conservative mind in this country opens itself sufficiently to the necessity of transformation, the resulting culture born of a resurgent India may well bring about a profound modification in the future civilisation of the world. But if it remains shut up in dead fictions, or tries to meet the new needs with the mind of the schoolman and the sophist dealing with words and ideas in the air rather than actual fact and truth and potentiality, or struggles merely to avoid all but a scanty minimum of change, then, since the new ideas cannot fail to realise themselves, the future India will be formed in the crude mould of the Westernised social and political reformer whose mind, barren of original thought and unenlightened by vital experience, can do nothing but reproduce the forms and ideas of Europe and will turn us all into halting apes of the West. Or else, and that perhaps is the best thing that can happen, a new spiritual awakening must arise from the depths of this vast life that shall this time more successfully include in its scope the great problems of earthly life as well as those of the soul and its transmundane destinies, an awakening that shall ally itself closely with the renascent spiritual seeking of the West and with its yearning for the perfection of the human race. This third and as yet unknown quantity is indeed the force needed throughout the East. For at present we have only two

www.holybooks.com
extremes of a conservative immobility and incompetence imprisoned in the shell of past conventions and a progressive force hardly less blind and ineffectual because secondhand and merely imitative of nineteenth-century Europe, with a vague floating mass of uncertainty between. The result is a continual fiasco and inability to evolve anything large, powerful, sure and vital, a drifting in the stream of circumstance, a constant grasping at details and unessentials and failure to reach the heart of the great problems of life which the age is bringing to our doors. Something is needed which tries to be born; but as yet, in the phrase of the Veda, the Mother holds herself compressed in smallness, keeps the Birth concealed within her being and will not give it forth to the Father. When she becomes great in impulse and conception, then we shall see it born.
Our Ideal

We believe in the constant progression of humanity and we hold that that progression is the working out of a Thought in Life which sometimes manifests itself on the surface and sometimes sinks below and works behind the mask of external forces and interests. When there is this lapse below the surface, humanity has its periods of apparent retrogression or tardy evolution, its long hours of darkness or twilight during which the secret Thought behind works out one of its phases by the pressure mainly of economic, political and personal interests ignorant of any deeper aim within. When the Thought returns to the surface, humanity has its periods of light and of rapid efflorescence, its dawns and splendid springtides; and according to the depth, vitality, truth and self-effective energy of the form of Thought that emerges is the importance of the stride forward that it makes during these Hours of the Gods in our terrestrial manifestation.

There is no greater error than to suppose, as the “practical” man is wont to do, that thought is only a fine flower and ornament of life and that political, economic and personal interests are the important and effective motors of human action. We recognise that this is a world of life and action and developing organism; but the life that seeks to guide itself only by vital and material forces is a slow, dark and blundering growth. It is an attempt to approximate man to the method of vegetable and animal existence. The earth is a world of Life and Matter, but man is not a vegetable nor an animal; he is a spiritual and a thinking being who is set here to shape and use the animal mould for higher purposes, by higher motives, with a more divine instrumentation.

Therefore by his very nature he serves the working of a Thought within him even when he is ignorant of it in his surface
self. The practical man who ignores or despises the deeper life of the Idea, is yet serving that which he ignores or despises. Charlemagne hewing a chaotic Europe into shape with his sword was preparing the reign of the feudal and Catholic interpretation of human life with all that that great though obscure period of humanity has meant for the thought and spiritual development of mankind. But it is when the Thought emerges and guides life that man grows towards his full humanity, strides forward on his path and begins to control the development of Nature in his destiny or at least to collaborate as a conscious mind and spirit with That which controls and directs it.

The progress of humanity has therefore been a constant revolution with its rhythm of alternative darkness and light, but both the day and the night have helped to foster that which is evolving. The periods have not been the same for all parts of the globe. In the historic ages of the present cycle of civilisation the movement has been almost entirely centred in the twin continents of Asia and Europe. And there it has been often seen that when Asia was moving through the light, Europe was passing through one of her epochs of obscurity and on the other hand the nights of Asia’s repose or stagnation have corresponded with the days of Europe’s mental vigour and vital activity.

But the fundamental difference has been that Asia has served predominantly (not exclusively) as a field for man’s spiritual experience and progression, Europe has been rather a workshop for his mental and vital activities. As the cycle progressed, the Eastern continent has more and more converted itself into a storehouse of spiritual energy sometimes active and reaching forward to new development, sometimes conservative and quiescent. Three or four times in history a stream of this energy has poured out upon Europe, but each time Europe has rejected wholly or partially the spiritual substance of the afflatus and used it rather as an impulse to fresh intellectual and material activity and progress.

The first attempt was the filtering of Egyptian, Chaldean and Indian wisdom through the thought of the Greek philosophers from Pythagoras to Plato and the Neo-Platonists; the result was
the brilliantly intellectual and unspiritual civilisation of Greece and Rome. But it prepared the way for the second attempt when Buddhism and Vaishnavism filtered through the Semitic temperament entered Europe in the form of Christianity. Christianity came within an ace of spiritualising and even of asceticising the mind of Europe; it was baffled by its own theological deformation in the minds of the Greek fathers of the Church and by the sudden flooding of Europe with a German barbarism whose temperament in its merits no less than in its defects was the very antitype both of the Christian spirit and the Graeco-Roman intellect.

The Islamic invasion of Spain and the southern coast of the Mediterranean—curious as the sole noteworthy example of Asiatic culture using the European method of material and political irruption as opposed to a peaceful invasion by ideas—may be regarded as a third attempt. The result of its meeting with Graecised Christianity was the reawakening of the European mind in feudal and Catholic Europe and the obscure beginnings of modern thought and science.

The fourth and last attempt which is as yet only in its slow initial stage is the quiet entry of Eastern and chiefly of Indian thought into Europe first through the veil of German metaphysics, more latterly by its subtle influence in reawakening the Celtic, Scandinavian and Slavonic idealism, mysticism, religionism, and the direct and open penetration of Buddhism, Theosophy, Vedantism, Bahaism and other Oriental influences in both Europe and America.

On the other hand, there have been two reactions of Europe upon Asia; first, the invasion of Alexander with his aggressive Hellenism which for a time held Western Asia, created echoes and reactions in India and returned through Islamic culture upon mediaeval Europe; secondly, the modern onslaught of commercial, political, scientific Europe upon the moral, artistic and spiritual cultures of the East.

The new features of this mutual interpenetration are, first, that the two attacks have synchronised and, secondly, that they have encountered in each case the extreme exaggeration of their
opposites. Intellectual and materialistic Europe found India, the Asia of Asia, the heart of the world’s spiritual life, in the last throes of an enormous experiment, the thought of a whole nation concentrated for centuries upon the pure spiritual existence to the exclusion of all real progress in the practical and mental life of the race. The entering stream of Eastern thought found in Europe the beginning of an era which rejected religion, philosophy and psychology,—religion as an emotional delusion, philosophy, the pure essence of the mind, as a barren thought-weaving,—and resolved to devote the whole intellectual faculty of man to a study of the laws of material Nature and of man’s bodily, social, economic and political existence and to build thereon a superior civilisation.

That stupendous effort is over; it has not yet frankly declared its bankruptcy, but it is bankrupt. It is sinking in a cataclysm as gigantic and as unnatural as the attempt which gave it birth. On the other hand, the exaggerated spirituality of the Indian effort has also registered a bankruptcy; we have seen how high individuals can rise by it, but we have seen also how low a race can fall which in its eagerness to seek after God ignores His intention in humanity. Both the European and the Indian attempt were admirable, the Indian by its absolute spiritual sincerity, the European by its severe intellectual honesty and ardour for the truth; both have accomplished miracles; but in the end God and Nature have been too strong for the Titanism of the human spirit and for the Titanism of the human intellect.

The salvation of the human race lies in a more sane and integral development of the possibilities of mankind in the individual and in the community. The safety of Europe has to be sought in the recognition of the spiritual aim of human existence, otherwise she will be crushed by the weight of her own unillumined knowledge and soulless organisation. The safety of Asia lies in the recognition of the material mould and mental conditions in which that aim has to be worked out, otherwise she will sink deeper into the slough of despond of a mental and physical incompetence to deal with the facts of life and the shocks of a rapidly changing movement. It is not any exchange
of forms that is required, but an interchange of regenerating impulses and a happy fusion and harmonising.

The synchronism and mutual interpenetration of the two great currents of human effort at such a crisis in the history of the race is full of hope for the future of humanity, but full also of possible dangers. The hope is the emergence of a new and better human life founded on a greater knowledge, a pursuit of the new faculties and possibilities opening out before us and a just view of the problem which the individual, the society, the race have to solve. Mankind has been drawn together by the developments of material science and for good or evil its external future is henceforth one; its different parts no longer develop separately and in independence of each other. There opens out at the same time the possibility that by the development and practice of the science and the life of the soul it may be made one in reality and by an internal unity.

The idea by which the enlightenment of Europe has been governed is the passion for the discovery of the Truth and Law that constitutes existence and governs the process of the world, the attempt to develop the life and potentialities of man, his ideals, institutions, organisations by the knowledge of that Law and Truth and the confidence that along this line lies the road of human progress and perfection.

The idea is absolutely just and we accept it entirely; but its application has been erroneous. For the Law and Truth that has to be discovered is not that of the material world — though this is required, nor even of the mental and physical — though this is indispensable, but the Law and Truth of the Spirit on which all the rest depends. For it is the power of the Self of things that expresses itself in their forms and processes.

The message of the East to the West is a true message, “Only by finding himself can man be saved,” and “what shall it profit a man though he gain the whole world, if he lose his own soul?” The West has heard the message and is seeking out the law and truth of the soul and the evidences of an inner reality greater than the material. The danger is that with her passion for mechanism and her exaggerated intellectualitly she may fog
herself in an external and false psychism, such as we see arising in England and America, the homes of the mechanical genius, or in intellectual, unspiritual and therefore erroneous theories of the Absolute, such as have run their course in critical and metaphysical Germany.

The idea by which the illumination of Asia has been governed is the firm knowledge that truth of the Spirit is the sole real truth, the belief that the psychological life of man is an instrument for attaining to the truth of the Spirit and that its laws must be known and practised with that aim paramount, and the attempt to form the external life of man and the institutions of society into a suitable mould for the great endeavour.

This idea, too, is absolutely just and we accept it entirely. But in its application, and in India most, it has deviated into a divorce between the Spirit and its instruments and a disparagement and narrowing of the mental and external life of the race. For it is only on the widest and richest efflorescence of this instrumental life that the fullest and most absolute attainment of the spiritual can be securely based. This knowledge the ancients of the East possessed and practised; it has been dimmed in knowledge and lost in practice by their descendants.

The message the West brings to the East is a true message. Man also is God and it is through his developing manhood that he approaches the godhead; Life also is the Divine, its progressive expansion is the self-expression of the Brahman, and to deny Life is to diminish the Godhead within us. This is the truth that returns to the East from the West translated into the language of the higher truth the East already possesses; and it is an ancient knowledge. The East also is awaking to the message. The danger is that Asia may accept it in the European form, forget for a time her own law and nature and either copy blindly the West or make a disastrous amalgam of that which she has in its most inferior forms and the crudenesses which are invading her.

The problem of thought therefore is to find out the right idea and the right way of harmony; to restate the ancient and eternal spiritual truth of the Self so that it shall re-embrace, permeate, dominate, transfigure the mental and physical life;
to develop the most profound and vital methods of psychological self-discipline and self-development so that the mental and psychical life of man may express the spiritual life through the utmost possible expansion of its own richness, power and complexity; and to seek for the means and motives by which his external life, his society and his institutions may remould themselves progressively in the truth of the spirit and develop towards the utmost possible harmony of individual freedom and social unity.

This is our ideal and our search. Throughout the world there are plenty of movements inspired by the same drift, but there is room for an effort of thought which shall frankly acknowledge the problem in its integral complexity and not be restrained in the flexibility of its search by attachment to any cult, creed or extant system of philosophy.

The effort involves a quest for the Truth that underlies existence and the fundamental Law of its self-expression in the universe — the work of metaphysical philosophy and religious thought; the sounding and harmonising of the psychological methods of discipline by which man purifies and perfects himself — the work of psychology, not as it is understood in Europe, but the deeper practical psychology called in India Yoga; and the application of our ideas to the problems of man’s social and collective life.

Philosophy and religious thought based on spiritual experience must be the beginning and the foundation of any such attempt; for they alone go behind appearances and processes to the truth of things. The attempt to get rid of their supremacy must always be vain. Man will always think and generalise and try to penetrate behind the apparent fact, for that is the imperativa...
obscurantism, and a philosophy which does not dynamise itself with the religious spirit is a barren light, for it cannot get itself practised. But again neither of these get their supreme value unless raised into the spirit and cast into life.

What then shall be our ideal? Unity for the human race by an inner oneness and not only by an external association of interests; the resurgence of man out of the merely animal and economic life or the merely intellectual and aesthetic into the glories of the spiritual existence; the pouring of the power of the spirit into the physical mould and mental instrument so that man may develop his manhood into that true supermanhood which shall exceed our present state as much as this exceeds the animal state from which science tells us that we have issued. These three are one; for man’s unity and man’s self-transcendence can come only by living in the Spirit.
The Superman
The Superman

The IDEAL of the Superman has been brought recently into much notice, some not very fruitful discussion and a good deal of obloquy. It is apt to be resented by average humanity because men are told or have a lurking consciousness that here is a claim of the few to ascend to heights of which the many are not capable, to concentrate moral and spiritual privileges and enjoy a domination, powers and immunities hurtful to a diffused dignity and freedom in mankind. So considered, supermanhood is nothing more important than a deification of the rare or solitary ego that has out-topped others in the force of our common human qualities. But this presentation is narrow and a travesty. The gospel of true supermanhood gives us a generous ideal for the progressive human race and should not be turned into an arrogant claim for a class or individuals. It is a call to man to do what no species has yet done or aspired to do in terrestrial history, evolve itself consciously into the next superior type already half foreseen by the continual cyclic development of the world-idea in Nature’s fruitful musings. And when we so envisage it, this conception ranks surely as one of the most potent seeds that can be cast by thought into the soil of our human growth.

Nietzsche first cast it, the mystic of Will-worship, the troubled, profound, half-luminous Hellenising Slav with his strange clarities, his violent half-ideas, his rare gleaming intuitions that came marked with the stamp of an absolute truth and sovereignty of light. But Nietzsche was an apostle who never entirely understood his own message. His prophetic style was like that of the Delphic oracles which spoke constantly the word of the Truth but turned it into untruth in the mind of the hearer. Not always indeed; for sometimes he rose beyond his personal temperament and individual mind, his European inheritance
and environment, his revolt against the Christ-idea, his war against current moral values and spoke out the Word as he had heard it, the Truth as he had seen it, bare, luminous, impersonal and therefore flawless and imperishable. But for the most part this message that had come to his inner hearing vibrating out of a distant Infinite like a strain caught from the lyre of far-off Gods, did get, in his effort to appropriate and make it nearer to him, mixed up with a somewhat turbulent surge of collateral ideas that drowned much of the pure original note.

Especially, in his concept of the Superman he never cleared his mind of a preliminary confusion. For if a sort of human godhead is the goal to which the race must advance, the first difficulty is that we have to decide to which of two very different types of divinity the idea in us should owe allegiance. For the deity within may confront us either with the clear, joyous and radiant countenance of the God or the stern convulsed visage of the Titan. Nietzsche hymned the Olympian but presented him with the aspect of the Asura. His hostile preoccupation with the Christ-idea of the crucified God and its consequences was perhaps responsible for this distortion, as much as his subjection to the imperfect ideas of the Greeks. He presents to us sometimes a superman who fiercely and arrogantly repels the burden of simple sorrow and service, not one who arises victorious over mortality and suffering, his ascension vibrant with the triumph-song of a liberated humanity. To lose the link of Nature’s moral evolution is a capital fault in the apostle of supermanhood; for only out of the unavoidable line of the evolution can that emerge in the bosom of a humanity long tested, ripened and purified by the fire of egoistic and altruistic suffering.

God and Titan, Deva and Asura, are indeed close kin in their differences; nor could either have been spared in the evolution. Yet do they inhabit opposite poles of a common existence and common nature. The one descends from the light and the infinity, satisfied, to the play; the other ascends from the obscurity and the vagueness, angry, to the struggle. All the acts of the God derive from the universal and tend to the universal. He was born out of a victorious harmony. His qualities join pure and
gracious hands and link themselves together naturally and with delight as in the pastoral round of Brindavan, divine Krishna dominating and holding together its perfect circles. To evolve in the sense of the God is to grow in intuition, in light, in joy, in love, in happy mastery; to serve by rule and to rule by service; to be able to be bold and swift and even violent without hurt or wickedness and mild and kindly and even self-indulgent without laxity or vice or weakness; to make a bright and happy whole in oneself and, by sympathy, with mankind and all creatures. And in the end it is to evolve a large impersonal personality and to heighten sympathy into constant experience of world-oneness. For such are the Gods, conscious always of their universality and therefore divine.

Certainly, power is included. To be the divine man is to be self-ruler and world-ruler; but in another than the external sense. This is a rule that depends upon a secret sympathy and oneness which knows the law of another’s being and of the world’s being and helps or, if need be, compels it to realise its own greatest possibilities, but by a divine and essentially an inner compulsion. It is to take all qualities, energies, joys, sorrows, thoughts, knowledge, hopes, aims of the world around us into ourselves and return them enriched and transmuted in a sublime commerce and exploitation. Such an empire asks for no vulgar ostentation or golden trappings. The gods work oftenest veiled by light or by the storm-drift; they do not disdain to live among men even in the garb of the herdsman or the artisan; they do not shrink from the cross and the crown of thorns either in their inner evolution or their outward fortunes. For they know that the ego must be crucified and how shall men consent to this if God and the gods have not shown them the way? To take all that is essential in the human being and uplift it to its most absolute term so that it may become an element of light, joy, power for oneself and others, this is divinity. This, too, should be the drift of supermanhood.

But the Titan will have nothing of all this; it is too great and subtle for his comprehension. His instincts call for a visible, tangible mastery and a sensational domination. How shall he
feel sure of his empire unless he can feel something writhing helpless under his heel, — if in agony, so much the better? What is exploitation to him, unless it diminishes the exploited? To be able to coerce, exact, slay, overtly, irresistibly, — it is this that fills him with the sense of glory and dominion. For he is the son of division and the strong flowering of the Ego. To feel the comparative limitation of others is necessary to him that he may imagine himself immeasurable; for he has not the real, self-existent sense of infinity which no outward circumstance can abrogate. Contrast, division, negation of the wills and lives of others are essential to his self-development and self-assertion. The Titan would unify by devouring, not by harmonising; he must conquer and trample what is not himself either out of existence or into subservience so that his own image may stand out stamped upon all things and dominating all his environment.

In Nature, since it started from division and egoism, the Titan had to come first; he is here in us as the elder god, the first ruler of man’s heaven and earth. Then arrives the God and delivers and harmonises. Thus the old legend tells us that the Deva and the Asura laboured together to churn the ocean of life for the supreme draught of immortality, but, once it had been won, Vishnu kept it for the God and defrauded the fiercer and more violent worker. And this seems unjust; for the Asura has the heavier and less grateful portion of the burden. He begins and leads; he goes his way hewing, shaping, planting: the God follows, amends, concludes, reaps. He prepares fiercely and with anguish against a thousand obstacles the force that we shall use: the other enjoys the victory and the delight. And therefore to the great God Shiva the stained and stormy Titan is very dear, — Shiva who took for himself the fierce, dark and bitter poison first churned up from the sea of life and left to others the nectar. But the choice that Shiva made with knowledge and from love, the Titans made from darkness and passion, — desirous really of something very different and deceived by their stormy egoism. Therefore the award of Vishnu stands; to the God shall fall the crown and the immortality and not, unless he divinise himself, to the proud and strenuous Asura.
For what is supermanhood but a certain divine and harmonious absolute of all that is essential in man? He is made in God’s image, but there is this difference between the divine Reality and its human representative that everything which in the one is unlimited, spontaneous, absolute, harmonious, self-possessed becomes in the other limited, relative, laboured, discordant, deformed, possessed by struggle, kept by subservience to one’s possessions, lost by the transience and insecurity which come from wrong holding. But in this constant imperfection there is always a craving and an aspiration towards perfection. Man, limited, yearns to the Infinite; relative, is attracted in all things towards their absolute; artificial in Nature, drives towards a higher ease, mastery and naturalness that must for ever be denied to her inconscient forces and half-conscient animals; full of discords, he insists upon harmony; possessed by Nature and to her enslaved, is yet convinced of his mission to possess and master her. What he aspires to, is the sign of what he may be. He has to pass by a sort of transmutation of the earthly metal he now is out of flawed manhood into some higher symbol. For Man is Nature’s great term of transition in which she grows conscious of her aim; in him she looks up from the animal with open eyes towards her divine ideal.

But God is complex, not simple; and the temptation of the human intellect is to make a short cut to the divine nature by the exclusive worship of one of its principles. Knowledge, Love whose secret word is Delight, Power and Unity are some of the Names of God. But though they are all divine, yet to follow any of them exclusively is to invite, after the first energy is over, His departure from us and denial; for even unity, exclusively pursued, ceases to be a true oneness. Yet this error we perpetually commit. Is it Love in whose temple we adore? Then we shut its gates upon Power as a child of the world and the devil and bid Knowledge carry elsewhere her lack of sweetness and remoteness from the heart’s fervour. We erect an idol of Power and would pass all else through the fire of Moloch before its sombre and formidable image, expelling Love with scorn as a nurse of weaklings and degrading Knowledge to the position of
a squire or even a groom of Force. Or we cultivate Knowledge with a severe aloofness and austerity to find at last the lotus of the heart dulled and fading — happy if its more divine faculties are not already atrophied — and ourselves standing impotent with our science while the thunders of Rudra crash through and devastate the world we have organised so well by our victorious and clear-minded efficiency. Or we run after a vague and mechanical zero we call unity and when we have sterilised our secret roots and dried up the wells of Life within us, discover, unwise unifiers, that we have achieved death and not a greater existence. And all this happens because we will not recognise the complexity of the riddle we are set here to solve. It is a great and divine riddle; but it is no knot of Gordius, nor is its all-wise Author a dead king that he should suffer us to mock his intention and cut through to our will with the fierce impatience of the hasty mortal conqueror.

None of these oppositions is more constant than that of Power and Love: yet neither of these deities can be safely neglected. What can be more divine than Love? But followed exclusively it is impotent to solve the world's discords. The worshipped Avatar of love and the tender saint of saints leave behind them a divine but unfollowed example, a luminous and imperishable but ineffective memory. They have added an element to the potentialities of the heart, but the race cannot utilise it effectively for life because it has not been harmonised with the rest of the qualities that are essential to our fullness. Shall we therefore turn round and give ourselves to Power with its iron hands of action and its hard and clear practical intellect? The men of power may say that they have done a more tangible work for their race than the souls of Love, but it is a vain advantage. For they have not even tried to raise us beyond our imperfect humanity. They have erected a temporary form or given a secular impetus. An empire has been created, an age or a century organised, but the level of humanity has not been raised nearer to the secret of a Caesar or a Napoleon. Love fails because it hastily rejects the material of the world's discords or only tramples them underfoot in an unusual ecstasy; Power because it seeks only to
organise an external arrangement. The world’s discords have to be understood, seized, transmuted. Love must call Power and Knowledge into the temple and seat them beside her in a unified equality; Power must bow its neck to the yoke of Light and Love before it can do any real good to the race.

Unity is the secret, a complex, understanding and embracing unity. When the full heart of Love is tranquillised by knowledge into a calm ecstasy and vibrates with strength, when the strong hands of Power labour for the world in a radiant fullness of joy and light, when the luminous brain of knowledge accepts and transforms the heart’s obscure inspirations and lends itself to the workings of the high-seated Will, when all these gods are founded together on a soul of sacrifice that lives in unity with all the world and accepts all things to transmute them, then is the condition of man’s integral self-transcendence. This and not a haughty, strong and brilliant egoistic self-culture enthroning itself upon an enslaved humanity is the divine way of supermanhood.
All-Will and Free-Will

His is surely a bounded soul who has never felt the brooding wings of a Fate overshadow the world, never looked beyond the circle of persons, collectivities and forces, never been conscious of the still thought or the assured movement of a Presence in things determining their march. On the other hand it is the sign of a defect in the thought or a void of courage and clearness in the temperament to be overwhelmed by Fate or hidden Presence and reduced to a discouraged acquiescence,—as if the Power in things nullified or rendered superfluous and abortive the same Power in myself. Fate and free-will are only two movements of one indivisible energy. My will is the first instrument of my Fate, Fate a Will that manifests itself in the irresistible subconscious intention of the world.

All error like all evil is born of a division in the indivisible. Because God has a myriad aspects, mind breaks up His unity; it creates a violent opposition and vain attempt at mutual exclusion in the united family of the Ideas and Powers that are convergently busy with the universe. Thus our thought erects a mysterious Fate or an equally mysterious free-will and insists that this or that must be but both shall not subsist together. It is a false and unreal quarrel. I have a will, that is plain; but it is not true that it is free in the sense of being a thing apart in the world determining itself and its actions and fruits as if it alone existed or as if it could at all shape itself except as visible crest and form of an invisible wave. Even the wave is more than itself; for that too has behind it the tramp of the whole measureless ocean of Force and Time. On the other hand there is no incalculable Fate, no blind, cruel and ineluctable Necessity against which the wings of the soul must dash themselves in vain as if it were a bird snared by a monstrous Fowler in a dim-lit and fantastic cage.
All times and nations have felt or played with the idea of Fate. The Greeks were pursued by the thought of a mysterious and ineffable Necessity presiding over the divine caprices of the gods. The Mahomedan sits calm and inert under the yoke of Kismet. The Hindu speaks of Karma and the writing on the forehead when he would console himself for calamity or failure or excuse himself from perseverance and masculine effort. And all these notions are akin in the general imprecision of the idea they shadow forth and the vague twilight in which they are content to leave its ulterior significance. Modern Science has brought in an equally formless and arbitrary predestination of Law of Nature and Heredity to contradict the idea of responsibility in a free, willing and acting soul. Where there is no soul, there can be no freedom. Nature works out her original law in man; our fathers and mothers with all that they carried in them are a second vital predestination and the dead generations impose themselves on the living; pressure of environment comes in as a third Fate to take from us the little chance of liberty we might still have snatched out of this infinite coiling of forces. The triple Moirai of the Greeks have been re-enthroned with other masks and new names. We believe once more in a tremendous weaving of our fate, but by the measured dance of immense material Powers. It is the old gods again, but stripped of intelligence and the chance of human sympathy, inexorable because they are conscious neither of themselves nor of us.

It is doubtful whether belief in Fate or free-will makes much difference to a man’s action, but it certainly matters a great deal to his temperament and inner being; for it puts its stamp on the cast of his soul. The man who makes belief in Fate an excuse for quiescence, would find some other pretext if this were lacking. His idea is only a decorous garment for his mood; it clothes his indolence and quiescence in a specious robe of light or drapes it with a noble mantle of dignity. But when his will clutches at an object or action, we do not find him pursuing it with a less strenuous resolution or, it may be, a less childish impatience or obstinacy than the freest believer in free-will. It is not our intellectual ideas that govern our action, but our nature and
temperament, — not *dhi*,¹ but *mati* or even *manyu*, or, as the Greeks would have said, *thumos* and not *nous*.

On the other hand a great man of action will often seize on the idea of Fate to divinise to himself the mighty energy that he feels driving him on the path of world-altering deeds. He is like a shell discharged from some dim Titanic howitzer planted in concealment far behind this first line of trenches which we see thrown out by Life into the material world; or he is like a planet sped out from Nature’s hands with its store of primal energy sufficient for its given time, its fixed service to the world-life, its settled orbit round a distant and sovereign Light. He expresses in the idea of Fate his living and constant sense of the energy which has cast him down here whether to break like some Vedic Marut the world’s firm and established things or to cut through mountains a path down which new rivers of human destiny can pour. Like Indra or Bhagirath he precedes; the throng of the divine waters follow. His movement decides their course; here Indus shall flow, there Ganges pace yellow and leonine to the sea. Therefore we find that the greatest men of action the world has known were believers in Fate or in a divine Will. Caesar, Mahomet, Napoleon, what more colossal workers has our past than these? The superman believes more readily in Destiny, feels more vitally conscious of God than the average human mind.

A saying of Napoleon’s is pregnant of the true truth of this matter. Questioned why, since he talked continually of fate, he thought it worth while to be always thinking and planning, he answered with just reason, “Because it is still Fate who wills that I should plan.” This is the truth. There is a Will or Force in the world that determines the result of my actions as part of the great whole; there is a Will in me that determines, concealed by my thought and personal choice, the part that I shall take in determining the whole. It is this that my mind seizes on and calls my will. But I and mine are masks. It is All-existence that gives

¹ These are terms of Vedic psychology. *Dhi* is the intellect; *mati*, the general mentality; *manyu*, the temperament and emotive mind.
me my reality; it is the All-will and All-knowledge that, while I calculate, works in me for its own incalculable purpose.

For this very reason I am right in laying stress on my free-will. If a Necessity governs even the gods, yet is my will a daughter of Necessity with a right in the mansion of her mother; or even it is a face of the divine Necessity that in many forms plays with the world. If Kismet is the will of God, yet is that will active in my present moment and not only in the hour of my birth or of the birth of the world. If Law of nature and heredity and environment are powerful, yet do they depend on the individual for the use to which they shall be turned.

The fruit of my actions belongs not to me, but to God and the world; my action belongs to God and myself. There I have a right. Or rather it belongs to God in myself; the right is His, but I enjoy it. The Will that works in me is the indivisible All which only seems to separate itself from itself in my body and personality, nāmarūpa, as the whole sea throws itself upon a particular coast in a particular surge of waves. The All and the I are at play of hide and seek with each other in a corner of an infinite universe.

I may play entirely at cross-purposes with the All-Will in me. That is when I lend my will-power to be a servant of the nervous part of my mind which, ignorant and passionate, adores self, openly or under many pretences, as its own god. It is this in me, this egoist, this hungerer that feels upon it in the heavy hand of Fate the oppression of a tyrant or the resistance of a blind and unintelligent power. For always absorbed in its own need and viewpoint it helps the All by that friction and opposition which are so essential to the mechanism of the world. Therefore it misunderstands the firm Teacher and His stern, yet loving compulsion in things and must progress by self-will and struggle and suffering because it cannot yet learn to progress by obedience. But also I may, by an intuition in my nature, an aspiration in my heart and a reason in my mind, put myself at the service of
The Superman

some strong ideal, some intelligent Force that serves God with
or without knowledge of Him. Then is my will a true will; it
does its share, it leaves its quota, it returns to its Master with
its talent used or increased. And to a certain extent it is free; for
a great liberty is this, to be delivered from the Animal and the
Rakshasa in ourselves, free to choose the right or be chosen by it.

But how different a thing would it be if I could persuade
my ego to break and emerge from the mould in which it has
taken refuge from its divine Pursuer! The great antinomy would
then be abrogated and not simply mitigated. My free-will would
become God-will and Fate put off her mask. By consenting to
be the mere slave of God and consciously but one instrument
of That which is not bound by its instruments, I should know
a freedom which sings on the harps of heaven, but which no
speech of man can utter; I should be washed and rolled in the
waves of pure puissance and pure ecstasy, the immeasurable
and unfathomable ecstasy of all-being and all-life and all-force.
I should see Fate illumined melting into Will and Will glorified
passing into God.
The Delight of Works

In Thy works there are always these three, the Master, the Worker and the Instrument. To define them in oneself rightly and rightly to possess them is the secret of works and of the delight of works.

Learn thou first to be the instrument of God and to accept thy Master. The instrument is this outward thing thou callest thyself; it is a mould of mind, a driving-force of power, a machinery of form, a thing full of springs and cogs and clamps and devices. Call not this the Worker or the Master; it can never be the Worker or the Master. Accept thyself humbly, yet proudly, devotedly, submissively and joyfully as a divine instrument.

There is no greater pride and glory than to be a perfect instrument of the Master.

Learn thou first absolutely to obey. The sword does not choose where it shall strike, the arrow does not ask whither it shall be driven, the springs of the machine do not insist on the product that shall be turned out from its labour. These things are settled by the intention and working of Nature and the more the conscious instrument learns to feel and obey the pure and essential law of its nature, the sooner shall the work turned out become perfect and flawless. Self-choice by the nervous motive-power, revolt of the physical and mental tool can only mar the working.

Let thyself drive in the breath of God and be as a leaf in the tempest; put thyself in His hand and be as the sword that strikes and the arrow that leaps to its target. Let thy mind be as the spring of the machine, let thy force be as the shooting of a piston, let thy work be as the grinding and shaping descent of the steel on its object. Let thy speech be the clang of the hammer on the anvil and the moan of the engine in its labour and the cry of the trumpet that proclaims the force of God to the regions.
In whatsoever way do as an instrument the work that is natural to thee and appointed.

The sword has a joy in the battle-play, the arrow has a mirth in its hiss and its leaping, the earth has a rapture in its dizzy whirl through space, the sun has the royal ecstasy of its blazing splendours and its eternal motion. O thou self-conscious instrument, take thou too the delight of thy own appointed workings.

The sword did not ask to be made, nor does it resist its user, nor lament when it is broken. There is a joy of being made and a joy of being used and a joy of being put aside and a joy too of being broken. That equal joy discover.

Because thou hast mistaken the instrument for the worker and the master and because thou seest to choose by the ignorance of thy desire thy own state and thy own profit and thy own utility, therefore thou hast suffering and anguish and hast many times to be thrust into the red hell of the furnace and hast many times to be reborn and reshaped and retempered until thou shalt have learned thy human lesson.

And all these things are because they are in thy unfinished nature. For Nature is the worker and what is it that she works at? She shapes out of her crude mind and life and matter a fully conscious being.

Know thyself next as the Worker. Understand thy nature to be the worker and thy own nature and All-Nature to be thyself.

This nature-self is not proper to thee nor limited. Thy nature has made the sun and the systems, the earth and her creatures, thyself and thine and all thou art and perceivest. It is thy friend and thine enemy, thy mother and thy devourer, thy lover and thy torturer, the sister of thy soul and an alien and a stranger, thy joy and thy sorrow, thy sin and thy virtue, thy strength and thy weakness, thy knowledge and thy ignorance. And yet it is none of these things, but something of which they are attempts and imperfect images. For beyond all these it is an original

www.holybooks.com
self-knowledge and an infinite force and innumerable quality.

But in thee there is a special movement, a proper nature and an individual energy. Follow that like a widening river till it leads thee to its infinite source and origin.

Know therefore thy body to be a knot in Matter and thy mind to be a whirl in universal Mind and thy life to be an eddy of Life that is for ever. Know thy force to be every other being's force and thy knowledge to be a glimmer from the light that belongs to no man and thy works to be made for thee and be delivered from the error of thy personality.

When that is done, thou shalt take thy free delight in the truth of thy individual being and in thy strength and in thy glory and in thy beauty and in thy knowledge; and in the denial of these things thou shalt take delight also. For all this is the dramatic mask of the Person and the self-image of the self-Sculptor.

Why shouldst thou limit thyself? Feel thyself also in the sword that strikes thee and the arms that embrace, in the blazing of the sun and the dance of the earth, in the flight of the eagle and the song of the nightingale, in all that is past and all that is now and all that is pressing forward to become. For thou art infinite and all this joy is possible to thee.

The Worker has the joy of her works and the joy of her Lover for whom she works. She knows herself to be his consciousness and his force, his knowledge and his reserving of knowledge, his unity and his self-division, his infinity and the finite of his being. Know thyself also to be these things; take thou also the delight of thy Lover.

There are those who know themselves as a workshop or an instrument or the thing worked, but they mistake the Worker for the Master; this too is an error. Those who fall into it can hardly arrive at her high, pure and perfect workings.

The instrument is finite in a personal image, the worker is universal with a personal trend, but neither of these is the Master; for neither is the true Person.

* * *

www.holybooks.com
Know last the Master to be thyself; but to this self put no form and seek for it no definition of quality. Be one with That in thy being, commune with That in thy consciousness, obey That in thy force, be subject to That and clasped by it in thy delight, fulfil That in thy life and body and mentality. Then before an opening eye within thee there shall emerge that true and only Person, thyself and not thyself, all others and more than all others, the Director and Enjoyer of thy works, the Master of the worker and the instrument, the Reveller and Trampler in the dance of the universe and yet hushed and alone with thee in thy soul’s silent and inner chamber.

The joy of the Master possessed, there is nothing else for thee to conquer. For He shall give thee Himself and all things and all creatures’ gettings and havings and doings and enjoyings for thy own proper portion, and He shall give thee that also which cannot be portioned.

Thou shalt contain in thy being thyself and all others and be that which is neither thyself nor all others. Of works this is the consummation and the summit.
Evolution
Evolution

WHAT IN its principle and scope is the force of evolution and how does it work out in the world?

The theory of evolution has been the key-note of the thought of the nineteenth century. It has not only affected all its science and its thought-attitude, but powerfully influenced its moral temperament, its politics and its society. Without it there could not have been that entire victory of the materialistic notion of life and the universe which has been the general characteristic of the age that is now passing,—a victory which for a time even claimed to be definitive,—nor such important corollary effects of this great change as the failure of the religious spirit and the breaking-up of religious beliefs. In society and politics it has led to the substitution of the evolutionary for the moral idea of progress and the consequent materialisation of social ideas and social progress, the victory of the economic man over the idealist. The scientific dogma of heredity, the theory of the quite recent emergence of the civilised thinking human animal, the popular notion of the all-pervading struggle for life and the aid it has given to an exaggerated development of the competitive instinct, the idea of the social organism and the aid it has given to the contrary development of economic socialism and the increasing victory of the organised State or community over the free individual,—all these are outflowings from the same source.

The materialistic view of the world is now rapidly collapsing and with it the materialistic statement of the evolution theory must disappear. Modern European thought progresses with a vertiginous rapidity. If it is Teutonic in its fidelity of observation and its tendency to laborious systematisation, it has also another side, Celtic-Hellenic, a side of suppleness, mobility, readiness for
rapid change, insatiable curiosity. It does not allow the same thought, the same system to exercise for very long a secure empire; it is in haste to question, to challenge, to reject, to remould, to discover new and opposite truths, to venture upon other experiments. At present this spirit of questioning has not attacked the evolution theory at its centre, but it is visibly preparing to give it a new form and meaning.

The general idea of evolution was the filiation of each successive form or state of things to that which preceded it, its appearance by a process of outbringing or deploying of some possibility prepared and even necessitated by previous states and previous tendencies. Not only does a form contain the seed of the form that reproduces it, but also the seed of the possible new form that varies from it. By successive progression a world-system evolves out of the nebula, a habitable planet appears in an uninhabitable system, protoplasmic life emerges by some yet unknown process out of Matter, the more developed grows out of the less developed organism. The fish and the creeping thing are the descendants of the plasm, the biped and quadruped trace back to the fish and reptile, man is a quadruped of the genus Ape who has learned to walk erect on two legs and has divested himself of characteristics unsuited to his new mode of life and progression. Force in Matter is the unconscious Goddess who has worked these miracles by her inherent principle of natural adaptation and in the organism by the additional machinery of heredity; by natural selection those species which reproduce new characteristics developed by adaptation to the environment and favourable to survival, tend to propagate themselves and remain; others fall back in the race of life and disappear.

Such were once the salient ideas; but some of them and not the least important are now questioned. The idea of the struggle for life tends to be modified and even denied; it is asserted that, at least as popularly understood, it formed no real part of Darwinism. This modification is a concession to reviving moralistic and idealistic tendencies which seek for a principle of love as well as a principle of egoism in the roots of life. Equally important are the conclusion arrived at by some investigators into the phenomena
of heredity that acquired characteristics are not handed down to
the posterity and the theory that it is chiefly predispositions that
are inherited; for by these modifications the process of evolution
begins to wear a less material and mechanical aspect; its source
and the seat of its motive power are shifted to that which is least
material, most psychical in Matter. Finally, the first idea of a
slow and gradual evolution is being challenged by a new theory
of evolution through sudden and rapid outbursts; and again we
pass from the sense of an obvious superficial machinery and all-
sufficient material necessity to profundities whose mystery is yet
to be fathomed.

In themselves, indeed, these modifications would not be
radical. Their importance lies in their synchronism with a great
resurgence, in new forms, of old ideas that had been submerged
by the materialistic wave. Theories of vitalism, idealistic tenden-
cies of thought, which were supposed to have been slain by the
march of physical Science, now arise, dispute the field and find
their account in every change of scientific generalisation which
at all opens the way to their own expansion and reassertion. In
what respects then is it likely that the evolution theory will be
found deficient by the wider and more complex thought of the
future and compelled to undergo essential changes?

In the first place, the materialistic theory of evolution starts
from the Sankhya position that all world is a development out
of indeterminate Matter by Nature-Force, but it excludes the
Silent Cause of the Sankhyas, the Purusha or observant and re-
reflective Soul. Hence it conceives the world as a sort of automatic
machine which has somehow happened. No intelligent cause,
no aim, no raison d’être, but simply an automatic deployment,
combination, chance self-adaptation of means to end without
any knowledge or intention in the adaptation. This is the first
paradox of the theory and its justification must be crushing and
conclusive if it is to be finally accepted by the human mind.

Again, Force in indeterminate Matter without any Con-
scious-Soul being all the beginning and all the material of things,
Mind, Life and Consciousness can only be developments out of
Matter and even only operations of Matter. They cannot be at
all things in themselves, different from Matter or in the last
degree independent of it. This is the second paradox and the
point at which the theory has eventually failed to establish itself.
More and more the march of knowledge leads towards the view
that the three are different forms of Force, each with its own
characteristics and proper method of action, each reacting upon
the other and enriching its forms by the contact.

An idea has even begun to dawn that there is not a single cre-
ation but a triple, material, vital and mental; it may be regarded
as a composite of three worlds, as it were, interpenetrating each
other. We are led back to the old Vedic idea of the triple world
in which we live. And we may reasonably forecast that when
its operations are examined from this new standpoint, the old
Vedic knowledge will be justified that it is one Law and Truth
acting in all, but very differently formulated according to the
medium in which the work proceeds and its dominant principle.
The same gods exist on all the planes and maintain the same
essential laws, but with a different aspect and mode of working
and to ever wider results.

If this be the truth, then the action of evolution must be other
than has been supposed. For example the evolution of Life in
Matter must have been produced and governed not by a mate-
rial principle, but by a Life-Principle working in and upon the
conditions of Matter and applying to it its own laws, impulses,
necessities. This idea of a mighty Life, other than the material
Principle, working in it and upon it has begun to dominate the
advanced thought of Europe. The other idea of a still mightier
Mind working in Life and upon it has not yet made sufficient
way because the investigation of the laws of Mind is still in its
groping infancy.

Again, the materialist theory supposes a rigid chain of ma-
terial necessity; each previous condition is a coordination of so
many manifest forces and conditions; each resulting condition
is its manifest result. All mystery, all element of the incalculable
disappears. If we can completely analyse the previous conditions
and discover their general law, we can be sure of the subse-
quent result, as in the case of an eclipse or an earthquake. For
Evolution 173

all is manifestation which is the logical result of a previous manifestation.

Once more the conclusion is too simple and trenchant; the world is more complex. Besides the manifest causes there are those that are unmanifest or latent and not subject to our analysis or come from behind or above and cannot be calculated and forecast though by a higher revelatory Knowledge they may be foreseen. This element increases as we climb the ladder of existence; its scope is greater in Life than in Matter, freer in Mind than in Life. European thought already tends to posit behind all manifest activity an Unmanifest called according to intellectual predilection either the Inconscient or the Subconscient which contains more and in a way unseizable to us knows more and can more than the surface existence. Out of this Unmanifest the manifest constantly emerges.

Again we return towards an ancient truth already known to the Vedic sages, — the idea of an inconscient or subconscious ocean of being, the ocean of the heart of things out of which the worlds form themselves. But the Veda posits also a governing and originating Superconscient which accounts for the appearance of a hidden consciousness and knowledge pervading the operations of Evolution and which constitutes the self-acting Law and Truth behind them.

The theory of materialistic evolution led naturally to the idea of a slow and gradual progression in a straight line. It admits reversions, atavisms, loops and zigzags of reaction deflecting the straight line, but these must necessarily be subordinate, hardly visible if we calculate by ages rather than by shorter periods of time. Here too, fuller knowledge disturbs the received notions. In the history of man everything seems now to point to alternations of a serious character, ages of progression, ages of recoil, the whole constituting an evolution that is cyclic rather than in one straight line. A theory of cycles of human civilisation has been advanced, we may yet arrive at the theory of cycles of human evolution, the Kalpa and Manwantaras of the Hindu theory. If its affirmation of cycles of world-existence is farther off from affirmation, it is because they must be so vast in their periods
as to escape not only all our means of observation, but all our means of deduction or definite inference.

Instead of slow, steady, minute gradations it is now suggested that new steps in evolution are rather effected by rapid and sudden outbursts, outbreaks, as it were, of manifestation from the unmanifest. Shall we say that Nature preparing slowly behind the veil, working a little backwards, working a little forwards, one day arrives at the combination of outward things which makes it possible for her to throw her new idea into a realised formation, suddenly, with violence, with a glorious dawning, with a grandiose stride? And that would explain the economy of her relapses and her reappearances of things long dead. She aims at a certain immediate result and to arrive at it more quickly and entirely she sacrifices many of her manifestations and throws them back into the latent, the unmanifest, the subconscious. But she has not finished with them; she will need them at another stage for a farther result. Therefore she brings them forward again and they reappear in new forms and other combinations and act towards new ends. So evolution advances.

And her material means? Not the struggle for life only. The real law, it is now suggested, is rather mutual help or at least mutual accommodation. Struggle exists, mutual destruction exists, but as a subordinate movement, a red minor chord, and only becomes acute when the movement of mutual accommodation fails and elbow-room has to be made for a fresh attempt, a new combination.

The propagation of acquired characteristics by heredity was too hastily and completely asserted; it is now perhaps in danger of being too summarily denied. Not Matter alone, but Life and Mind working upon Matter help to determine evolution. Heredity is only a material shadow of soul-reproduction, of the rebirth of Life and Mind into new forms. Ordinarily, as a constant factor or basis, there is the reproduction of that which was already evolved; for new characteristics to be propagated in the species they must have been accepted, received, sanctioned in the vital and mental worlds; then only can they be automatically self-reproduced from the material seed. Otherwise they are
private and personal acquisitions and are returned into the State exchequer, the treasury of the subconscient, and do not go to the family estate. When the mind-world and life-world are ready, they are poured out freely on fit recipients. This is the reason why it is predisposition that is chiefly inherited. The psychical and vital force in the material principle is first impressed; when that has been done on a sufficient scale, it is ready for a general new departure and an altered heredity appears.

Thus the whole view of Evolution begins to change. Instead of a mechanical, gradual, rigid evolution out of indeterminate Matter by Nature-Force we move towards the perception of a conscious, supple, flexible, intensely surprising and constantly dramatic evolution by a superconscient Knowledge which reveals things in Matter, Life and Mind out of the unfathomable Inconscient from which they rise.
The Inconscient

The first or superficial view which the observing mind takes on any object of knowledge is always an illusory view; all science, all true knowledge comes by going behind the superfluities and discovering the inner truth and the hidden law. It is not that the thing itself is illusory, but that it is not what it superficially appears to be; nor is it that the operations and functionings we observe on the surface do not take place, but that we cannot find their real motive-power, process, relations by the simple study of them as they offer themselves to the observing senses.

In the realm of physical science this is obvious enough and universally admitted. The earth is not flat but round, not still but constant to a double motion; the sun moves but not round the earth; bodies that seem to us luminous are in themselves non-luminous; things that are part of our daily experience, colour, sound, light, air are quite other in their reality than what they pretend to be. Our senses give us false views of distance, size, shape, relation. Objects which seem to them self-existent forms are aggregations and constituted by subtler constituents which our ordinary faculties are unable to detect. These material constituents again are merely formulations of a Force which we cannot describe as material and of which the senses have no evidence. Yet the mind and the senses can live quite satisfied and convinced in this world of illusions and accept them as the practical truth — for to a certain extent they are the practical truth and sufficient for an initial, ordinary and limited activity.

But only to a certain extent; for there are possibilities of a wider life, a more mastering action, a greater practicality which can only be achieved by going behind these surfaces and utilising a truer knowledge of objects and forces. The discovery of the secret operations of Nature leads to a contingent discovery, the
possibility of a farther use of her forces to which she herself has not proceeded, not finding them necessary for the mere preservation of existence and its ordinary workings, but has left to man, her mental being, to discover and utilise for the amelioration of existence and for the development of its possibilities.

All this is easy to see in the realm of Matter; but mankind is not yet entirely ready to recognise the same truth and follow up the same principle in the realm of Mind. It is true that psychology has made an advance and has begun to improve its method. Formerly, it was a crude, scholastic and superficial systematisation of man’s ignorance of himself. The surface psychological functionings, will, mind, senses, reason, conscience, etc., were arranged in a dry and sterile classification; their real nature and relation to each other were not fathomed nor any use made of them which went beyond the limited action Nature had found sufficient for a very superficial mental and psychic life and for very superficial and ordinary workings. Because we do not know ourselves, therefore we are unable to ameliorate radically our subjective life or develop with mastery, with rapidity, with a sure science the hidden possibilities of our mental capacity and our moral nature. The new psychology seeks indeed to penetrate behind superficial appearances, but it is encumbered by initial errors which prevent a profounder knowledge, — the materialistic error which bases the study of mind upon the study of the body; the sceptical error which prevents any bold and clear-eyed investigation of the hidden profundities of our subjective existence; the error of conservative distrust and recoil which regards any subjective state or experience that departs from the ordinary operations of our mental and psychical nature as a morbidity or a hallucination, — just as the Middle Ages regarded all new science as magic and a diabolical departure from the sane and right limits of human capacity; finally, the error of objectivity which leads the psychologist to study others from outside instead of seeing his true field of knowledge and laboratory of experiment in himself. Psychology is necessarily a subjective science and one must proceed in it from the knowledge of oneself to the knowledge of others.
But whatever the crudities of the new science, it has at least
taken the first capital step without which there can be no true
psychological knowledge; it has made the discovery which is
the beginning of self-knowledge and which all must make who
deeply study the facts of consciousness,—that our waking and
surface existence is only a small part of our being and does not
yield to us the root and secret of our character, our mentality or
our actions. The sources lie deeper. To discover them, to know
the nature and the processes of the inconscient or subconscient
self and, so far as is possible, to possess and utilise them as
physical science possesses and utilises the secret of the forces of
Nature ought to be the aim of a scientific psychology.

But here the first difficulty confronts us, the problem
whether this other and greater self of which our waking ex-
istence is only a surface and a phenomenon, is subconscient
or inconscient. And thereon hinges the whole destiny of the
human being. For if it is inconscient in its very nature, then
we cannot hope to illuminate ourselves with the hidden light of
these depths—for light there is none—or to find and to possess
ourselves of the secret of its power. On the other hand if it is
subconscient, that is to say a concealed consciousness deeper,
greater, more powerful than our superficial self, an endless vista
of self-enlargement opens out before us and the human race
marches towards infinite possibilities.

Modern psychological experiment and observation have
proceeded on two different lines which have not yet found their
point of meeting. On the one hand psychology has taken for
its starting-point the discoveries and the fundamental thesis of
the physical sciences and has worked as a continuation of phys-
ology. The physical sciences are the study of inconscient Force
working in inconscient Matter and a psychology which accepts
this formula as the basis of all existence must regard conscious-
ness as a phenomenal result of the Inconscient working on the
inconscient. Mind is only an outcome and as it were a record
of nervous reactions. The true self is the inconscient; mental
action is one of its subordinate phenomena. The Inconscient
is greater than the conscient; it is the god, the magician, the
creator whose action is far more unerring than the ambitious but blundering action of the conscious mentality. The tree is more perfectly guided than man in its more limited action, precisely because it lives unambitiously according to Nature and is passive in the hands of the Inconscient. Mind enters in to enlarge the field of activity, but also to multiply errors, perversities, revolts against Nature, departures from the instinctive guiding of the Inconscient Self which generate that vast element of ignorance, falsehood and suffering in human life,—that “much falsehood in us” of which the Vedic poet complains.

Where then lies the hope that mind will repair its errors and guide itself according to the truth of things? The hope lies in Science, in the intelligent observation, utilising, initiation of the forces and workings of the Inconscient. To take only one instance,—the Inconscient operates by the law of heredity and, left to itself, works faultlessly to ensure the survival of good and healthy types. Man misuses heredity in the false conditions of his social life to transmit and perpetuate degeneracy. We must study the law of heredity, develop a science of Eugenics and use it wisely and remorselessly— with the remorseless wisdom of Nature—so as to ensure by intelligence the result that the Inconscient assures by instinctive adaptation. We can see where this idea and this spirit will lead us,—to the replacement of the emotional and spiritual idealism which the human mind has developed by a cold sane materialistic idealism and to an amelioration of mankind attempted by the rigorous mechanism of the scientific expert, no longer by the profound inspiration of genius and the supple aspiration of puissant character and personality. And yet what if this were only another error of the conscient mind? What if the mistaking and the disease, the revolt and departure from Nature were itself a part, a necessary part of the wise and unerring plan of the profound Inconscient Self and all the much falsehood a means of arriving at a greater truth and a more exalted capacity? The fact that genius itself, the highest result of our developing consciousness, flowers so frequently on a diseased branch is a phenomenon full of troubling suggestions. The clear way of ascertained science need not always be the best
way; it may stand often in the path of development of a yet greater and deeper Knowledge.

The other line of psychological investigation is still frowned upon by orthodox science, but it thrives and yields its results in spite of the anathema of the doctors. It leads us into by-paths of psychical research, hypnotism, mesmerism, occultism and all sorts of strange psychological gropings. Certainly, there is nothing here of the assured clearness and firmly-grounded positivism of the physical method. Yet facts emerge and with the facts a momentous conclusion,—the conclusion, that there is a “subliminal” self behind our superficial waking mind not inconscient but conscient, greater than the waking mind, endowed with surprising faculties and capable of a much surer action and experience, conscient of the superficial mind though of it the superficial mind is inconscient. And then a question rises. What if there were really no Inconscient at all, but a hidden Consciousness everywhere perfect in power and wisdom, of which our mind is the first slow, hesitating and imperfect disclosure and into the image of which the human mentality is destined progressively to grow? It would at least be no less valid a generalisation and it would explain all the facts that we now know considerably better than the blind and purposeless determinism of the materialistic theory.

In pursuing psychological investigation upon this line we shall only be resuming that which had already been done by our remote forefathers. For they too, the moment they began to observe, to experiment, to look below the surface of things, were compelled to perceive that the surface man is only a form and appearance and that the real self is something infinitely greater and more profound. They too must have passed through the first materialistic stages of science and philosophy. For we read in the Aitareya Upanishad that entering upon possession of the material world and the body, the Purusha, the Conscious Soul, asks himself, “If utterance is by speech and life by the breath, vision by the eye, hearing by the ear, thought by the mind,” if in short all the apparent activities of the being can be accounted for by the automatic functioning of Nature, “then what am I?” And
The Inconscient says farther, “He being born distinguished only the working of the material elements, for what else was there of which he should discuss and conclude?” Yet in the end “he beheld this conscious being which is Brahman utterly extended and he said to himself, Now have I really seen.” So too in the Taittiriya Upanishad Bhrigu Varuni meditating on the Brahman comes first to the conclusion that “Matter is Brahman” and only afterwards discovers Life that is Brahman, — so rising from the materialistic to the vitalistic theory of existence as European thought is now rising, — then Mind that is Brahman and then Knowledge that is Brahman, — so rising to the sensational and the idealistic realisations of the truth — and at last Bliss of Existence that is Brahman. There he pauses in the ultimate spiritual realisation, the highest formulation of knowledge that man can attain.

The Conscient therefore and not the Inconscient was the Truth at which the ancient psychology arrived; and it distinguished three strata of the conscient self, the waking, the dream and the sleep selves of Man, — in other words the superficial existence, the subconscient or subliminal and the superconscient which to us seems the inconscient because its state of consciousness is the reverse of ours: for ours is limited and based on division and multiplicity, but this is “that which becomes a unity”; ours is dispersed in knowledge, but in this other self conscious knowledge is self-collected and concentrated; ours is balanced between dual experiences, but this is all delight, it is that which in the very heart of our being fronts everything with a pure all-possessing consciousness and enjoys the delight of existence.¹ Therefore, although its seat is that stratum of consciousness which to us is a deep sleep, — for the mind there cannot maintain its accustomed functioning and becomes inconscient, — yet its name is He who knows, the Wise One, Prajna. “This” says the Mandukya Upanishad, “is omniscient, omnipotent, the inner control, the womb of all and that from which creatures are born and into which they depart.” It answers,

¹ See the Mandukya Upanishad for these brief and profound definitions.
therefore, closely enough to the modern idea of the Inconscient corrected by the other modern idea of the subliminal self; for it is inconscient only to the waking mind precisely because it is superconscient to it and the mind is therefore only able to seize it in its results and not in itself. And what better proof can there be of the depth and truth of the ancient psychology than the fact that when modern thought in all its pride of exact and careful knowledge begins to cast its fathom into these depths, it is obliged to repeat in other language what had already been written nearly three thousand years ago?

We find the same idea of this inner control repeated in the Gita; for it is the Lord who “sits in the hearts of all creatures and turns all creatures mounted on an engine by his Maya.” At times the Upanishad seems to describe this Self as the “mental being leader of the life and the body”, which is really the subliminal mind of the psychical investigators; but this is only a relative description. The Vedantic psychology was aware of other depths that take us beyond this formula and in relation to which the mental being becomes in its turn as superficial as is our waking to our subliminal mind. And now once more in the revolutions of human thought these depths have to be sounded; modern psychology will be led perforce, by the compulsion of the truth that it is seeking, on to the path that was followed by the ancient. The new dawns, treading the eternal path of the Truth, follow it to the goal of the dawns that have gone before, — how many, who shall say?

For this knowledge was not first discovered in the comparatively late antiquity that gave us the Upanishads which we now possess. It is already there in the dateless verses of the Rig Veda, and the Vedic sages speak of it as the discovery of yet more ancient seers besides whom they themselves were new and modern. Emerging from the periods of eclipse and the nights of ignorance which overtake humanity, we assume always that we are instituting a new knowledge. In reality, we are continually rediscovering the knowledge and repeating the achievement of the ages that have gone before us, — receiving again out of the “Inconscient” the light that it had drawn back into its secracies
and now releases once more for a new day and another march of the great journey.

And the goal of that journey cannot be other than the “highest good” which the ancient psychologists proposed to the life and growth of the soul. Man, the mental being, once aware that there is this deep, great and hidden self, the real reality of his being, must necessarily seek to enter into it, to become conscious in it, to make there his centre instead of dwelling on the surface, to win and apply its diviner law and supreme nature and capacity, to make himself one with it so that he shall become the Real instead of the Apparent Man. And the sole debate that remains is whether this great conquest can be achieved and enjoyed in this human life and terrestrial body or is only possible beyond — whether in fact the human consciousness is the chosen instrument for the progressive self-revelation of this “Inconscient”, this real self within us, or only a baulked effort with no fruition here or a haphazard and incomplete sketch that can never be perfected into the divine image.
Materialism

Many hard things have been said about materialism by those who have preferred to look at life from above rather than below or who claim to live in the more luminous atmosphere of the idealistic mind or ether of the spiritual existence. Materialism has been credited with the creation of great evils, viewed even as the archimage of a detestable transformation or the misleader guiding mankind to an appalling catastrophe. Those whose temperament and imagination dally lovingly with an idealised past, accuse it for the cultural, social, political changes which they abhor, regarding them as a disturbance, happily, they believe, temporary, of eternal moral values and divinely ordained hierarchies. Those, more numerous, who look beyond to the hope of a larger idealism and higher spirituality, proclaim in its decline and passing away a fortunate deliverance for the human spirit. World-wide strife and competition have been, it is said, its fruits, war and the holocaust of terrible sacrifice in which mankind has been squandering its strength, blood, treasure, — though these are no new calamities, nor would it be safe to hope that they are the last of their kind, — are pointed to as its nemesis or regarded as a funeral pyre it has lighted for itself in whose cruel flame the errors and impurities it brought into existence are being burned to ashes. Science has been declared suspect as a guide or instructor of mankind and bidden to remain parked within her proper limits, because she was for long the ally of the material view of existence, a suggester of atheism and agnosticism, a victory-bringer of materialism and scepticism, the throne of their reign or pillar of their stability. Reason has been challenged because rationalism and free-thought were appropriated as synonyms of materialistic thinking.

All this wealth of accusation may have and much of it has
its truth. But most things that the human mind thus alternately trumpets and bans, are a double skein. They come to us with opposite faces, their good side and their bad, a dark aspect of error and a bright of truth; and it is as we look upon one or the other visage that we swing to our extremes of opinion or else oscillate between them. Materialism may not be quite as dead as most would declare it to be; still held by a considerable number of scientific workers, perhaps a majority,—and scientific opinion is always a force both by its power of well-ascertained truth and its continued service to humanity,—it constitutes even now the larger part of the real temper of action and life even where it is rejected as a set opinion. The strong impressions of the past are not so easily erased out of our human mentality. But it is a fast receding force; other ideas and standpoints are crowding in and thrust it out from its remaining points of vantage. It will be useful before we say farewell to it, and can now be done with safety, to see what it was that gave to it its strength, what it has left permanently behind it, and to adjust our new viewpoints to whatever stuff of truth may have lain within it and lent it its force of applicability. Even we can look at it with an impartial sympathy, though only as a primary but lesser truth of our actual being,—for it is all that, but no more than that,—and try to admit and fix its just claims and values. We can now see too how it was bound to escape from itself by the widening of the very frame of knowledge it has itself constructed.

Admit,—for it is true,—that this age of which materialism was the portentous offspring and in which it had figured first as petulant rebel and aggressive thinker, then as a grave and strenuous preceptor of mankind, has been by no means a period of mere error, calamity and degeneration, but rather a most powerful creative epoch of humanity. Examine impartially its results. Not only has it immensely widened and filled in the knowledge of the race and accustomed it to a great patience of research, scrupulosity, accuracy,—if it has done that only in one large sphere of inquiry, it has still prepared for the extension of the same curiosity, intellectual rectitude, power for knowledge to other and higher fields,—not only has it with an unexampled
force and richness of invention brought and put into our hands, for much evil, but also for much good, discoveries, instruments, practical powers, conquests, conveniences which, however we may declare their insufficiency for our highest interests, yet few of us would care to relinquish, but it has also, paradoxical as that might at first seem, strengthened man’s idealism. On the whole, it has given him a kindlier hope and humanised his nature. Tolerance is greater, liberty has increased, charity is more a matter of course, peace, if not yet practicable, is growing at least imaginable. Latterly the thought of the eighteenth century which promulgated secularism has been much scouted and belittled, that of the nineteenth which developed it, riddled with adverse criticism and overpassed. Still they worshipped no mean godheads. Reason, science, progress, freedom, humanity were their ideals, and which of these idols, if idols they are, would we like or ought we, if we are wise, to cast down into the mire or leave as poor unworshipped relics on the wayside? If there are other and yet greater godheads or if the visible forms adored were only clay or stone images or the rites void of the inmost knowledge, yet has their cult been for us a preliminary initiation and the long material sacrifice has prepared us for a greater religion.

Reason is not the supreme light, but yet is it always a necessary light-bringer and until it has been given its rights and allowed to judge and purify our first infra-rational instincts, impulses, rash fervours, crude beliefs and blind prejudices, we are not altogether ready for the full unveiling of a greater inner luminary. Science is a right knowledge, in the end only of processes, but still the knowledge of processes too is part of a total wisdom and essential to a wide and a clear approach towards the deeper Truth behind. If it has laboured mainly in the physical field, if it has limited itself and bordered or overshadowed its light with a certain cloud of wilful ignorance, still one had to begin this method somewhere and the physical field is the first, the nearest, the easiest for the kind and manner of inquiry undertaken. Ignorance of one side of Truth or the choice of a partial ignorance or ignoring for better concentration on another side is often a necessity of our imperfect mental nature.
It is unfortunate if ignorance becomes dogmatic and denies what it has refused to examine, but still no permanent harm need have been done if this willed self-limitation is compelled to disappear when the occasion of its utility is exhausted. Now that we have founded rigorously our knowledge of the physical, we can go forward with a much firmer step to a more open, secure and luminous repossession of mental and psychic knowledge. Even spiritual truths are likely to gain from it, not a loftier or more penetrating, — that is with difficulty possible, — but an ampler light and fuller self-expression.

Progress is the very heart of the significance of human life, for it means our evolution into greater and richer being; and these ages by insisting on it, by forcing us to recognise it as our aim and our necessity, by making impossible hereafter the attempt to subsist in the dullness or the gross beatitude of a stationary self-content, have done a priceless service to the earthly life and cleared the ways of heaven. Outward progress was the greater part of its aim and the inward is the more essential? but the inward too is not complete if the outward is left out of account. Even if the insistence of our progress fall for a time too exclusively on growth in one field, still all movement forward is helpful and must end by giving a greater force and a larger meaning to our need of growth in deeper and higher provinces of our being. Freedom is a godhead whose greatness only the narrowly limited mind, the State-worshipper or the crank of reaction can now deny. No doubt, again, the essential is an inner freedom; but if without the inner realisation the outer attempt at liberty may prove at last a vain thing, yet to pursue an inner liberty and perpetuate an outer slavery or to rejoice in an isolated release and leave mankind to its chains was also an anomaly that had to be exploded, a confined and too self-centred ideal. Humanity is not the highest godhead; God is more than humanity; but in humanity too we have to find and to serve him. The cult of humanity means an increasing kindliness, tolerance, charity, helpfulness, solidarity, universality, unity, fullness of individual and collective growth, and towards these things we are advancing much more rapidly than was possible in any
previous age, if still with sadly stumbling footsteps and some fierce relapses. The cult of our other human selves within the cult of the Divine comes closer to us as our large ideal. To have brought even one of these things a step nearer, to have helped to settle them with whatever imperfect expression and formula in our minds, to have accelerated our movement towards them are strong achievements, noble services.

Objection can at once be made that all these great things have no connection with materialism. The impulse towards them was of old standing and long active in the human mind; the very principle of the humanitarianism which has been one of the striking developments of modern sentiment, was first brought out from our nature and made prominent by religion, compassion and the love of man first intimately and powerfully enforced by Christianity and Buddhism; if they have now a little developed, it is the natural expanding from seeds that had long been sown. Materialism was rather calculated to encourage opposite instincts; and the good it favoured it limited, made arid, mechanism. If all these nobler things have grown and are breaking the bounds set to them, it is because man is fortunately inconsistent and after a certain stage of our development cannot be really and wholly materialistic; he needs ideals, ethical expansion, a closer emotional fulfilment, and these needs he has tacked on to his development of materialistic opinion and corrected its natural results by them. But the ideals themselves were taken from an anterior opinion and culture.

This is the truth, but not the whole truth. The old religious cultures were often admirable in the ensemble and always in some of their parts, but if they had not been defective, they could neither have been so easily breached, nor would there have been the need of a secularist age to bring out the results the religions had sown. Their faults were those of a certain narrowness and exclusive vision. Concentrated, intense in their ideal and intensive in their effect, their expansive influence on the human mind was small. They isolated too much their action in the individual, limited too narrowly the working of their ideals in the social order, tolerated for instance and even utilised for the ends of
church and creed an immense amount of cruelty and barbarism which were contrary to the spirit and truth from which they had started. What they discouraged in the soul of the individual, they yet maintained in the action and the frame of society, seemed hardly to conceive of a human order delivered from these blots. The depth and fervour of their aspiration had for its shadow a want of intellectual clarity, an obscurity which confused their working and baulked the expansion of their spiritual elements. They nourished too a core of asceticism and hardly cared to believe in the definite amelioration of the earth life, despised by them as a downfall or a dolorous descent or imperfection of the human spirit, or whatever earthly hope they admitted saw itself postponed to the millennial end of things. A belief in the vanity of human life or of existence itself suited better the preoccupation with an aim beyond earth. Perfection, ethical growth, liberation became individual ideals and figured too much as an isolated preparation of the soul for the beyond. The social effect of the religious temperament, however potentially considerable, was cramped by excessive other-worldliness and distrust in the intellect accentuated to obscurantism.

The secularist centuries weighed the balance down very much in the opposite direction. They turned the mind of the race wholly earthwards and manwards, but by insisting on intellectual clarity, reason, justice, freedom, tolerance, humanity, by putting these forward and putting the progress of the race and its perfectibility as an immediate rule for the earthly life to be constantly pressed towards and not shunting off the social ideal to doomsday to be miraculously effected by some last divine intervention and judgment, they cleared the way for a collective advance. For they made these nobler possibilities of mankind more imperative to the practical intelligence. If they lost sight of heaven or missed the spiritual sense of the ideals they took over from earlier ages, yet by this rational and practical insistence on them they drove them home to the thinking mind. Even their too mechanical turn developed from a legitimate desire to find some means for making the effective working of these ideals a condition of the very structure of society. Materialism
was only the extreme intellectual result of this earthward and human turn of the race mind. It was an intellectual machinery used by the Time-spirit to secure for a good space the firm fixing of that exclusive turn of thought and endeavour, a strong rivet of opinion to hold the mind of man to it for as long as it might be needed. Man does need to develop firmly in all his earthly parts, to fortify and perfect his body, his life, his outward-going mind, to take full possession of the earth his dwelling-place, to know and utilise physical Nature, enrich his environment and satisfy by the aid of a generalised intelligence his evolving mental, vital and physical being. That is not all his need, but it is a great and initial part of it and of human perfection. Its full meaning appears afterwards; for only in the beginning and in the appearance an impulse of his life, in the end and really it will be seen to have been a need of his soul, a preparing of fit instruments and the creating of a fit environment for a diviner life. He has been set here to serve God's ways upon earth and fulfil the Godhead in man and he must not despise earth or reject the basis given for the first powers and potentialities of the Godhead. When his thought and aim have persisted too far in that direction, he need not complain if he is swung back for a time towards the other extreme, to a negative or a positive, a covert or an open materialism. It is Nature's violent way of setting right her own excess in him.

But the intellectual force of materialism comes from its response to a universal truth of existence. Our dominant opinions have always two forces behind them, a need of our nature and a truth of universal existence from which the need arises. We have the material and vital need because life in Matter is our actual basis, the earthward turn of our minds because earth is and was intended to be the foundation here for the workings of the Spirit. When indeed we scan with a scrupulous intelligence the face that universal existence presents to us or study where we are one with it or what in it all seems most universal and permanent, the first answer we get is not spiritual but material. The seers of the Upanishads saw this with their penetrating vision and when they gave this expression of our first apparently
complete, eventually insufficient view of Being, “Matter is the Brahman, from Matter all things are born, by Matter they exist, to Matter they return,” they fixed the formula of universal truth of which all materialistic thought and physical science are a recognition, an investigation, a filling in of its significant details, elucidations, justifying phenomena and revelatory processes, the large universal comment of Nature upon a single text.

Mark that it is the first fact of experience from which we start and up to a certain point an undeniable universal truth of being. Matter surely is here our basis, the one thing that is and persists, while life, mind, soul and all else appear in it as a secondary phenomenon, seem somehow to arise out of it, subsist by feeding upon it, — therefore the word used in the Upanishads for Matter is annam, food, — and collapse from our view when it disappears. Apparently the existence of Matter is necessary to them, their existence does not appear to be one whit necessary to Matter. The Being does present himself at first with this face, inexorably, as if claiming to be that and nothing else, insisting that his material base and its need shall first be satisfied and, until that is done, grimly persistent with little or with no regard for our idealistic susceptibilities and caring nothing if he breaks through the delicate net of our moral, our aesthetic and our other finer perceptions. They have the hope of their reign, but meanwhile this is the first visage of universal existence and we have not to hide our face from it any more than could Arjuna from the terrible figure of the Divine on the battle-field of Kurukshetra, or attempt to escape and evade it as Shiva, when there rose around him the many stupendous forms of the original Energy, fled from the vision of it to this and that quarter, forgetful of his own godhead. We must look existence in the face in whatever aspect it confronts us and be strong to find within as well as behind it the Divine.

Materialistic science had the courage to look at this universal truth with level eyes, to accept it calmly as a starting-point and to inquire whether it was not after all the whole formula of universal being. Physical science must necessarily to its own first view be materialistic, because so long as it deals with the
physical, it has for its own truth’s sake to be physical both in its standpoint and method; it must interpret the material universe first in the language and tokens of the material Brahman, because these are its primary and its general terms and all others come second, subsequently, are a special syllabary. To follow a self-indulgent course from the beginning would lead at once towards fancies and falsities. Initially, science is justified in resenting any call on it to indulge in another kind of imagination and intuition. Anything that draws it out of the circle of the phenomena of objects, as they are represented to the senses and their instrumental prolongations, and away from the dealings of the reason with them by a rigorous testing of experience and experimentations, must distract it from its task and is inadmissible. It cannot allow the bringing in of the human view of things; it has to interpret man in the terms of the cosmos, not the cosmos in the terms of man. The too facile conclusion of the idealist that since things only exist as known to consciousness, they can exist only by consciousness and must be creations of the mind, has no meaning for it; it first has to inquire what consciousness is, whether it is not a result rather than a cause of Matter, coming into being, as it seems to do, only in the frame of a material inconscient universe and apparently able to exist only on the condition that that has been previously established. Starting from Matter, science has to be at least hypothetically materialistic.

When the action of the material principle, the first to organise itself, has been to some extent well understood, then can this science go on to consider what claim to be quite other terms of our being,—life and mind. But first it is forced to ask itself whether both mind and life are not, as they seem to be, special consequences of the material evolution, themselves powers and movements of Matter. After and if this explanation has failed to cover and to elucidate the facts, it can be more freely investigated whether they are not quite other principles of being. Many philosophical questions arise, as, whether they have entered into Matter and whence or were always in it, and if so, whether they are for ever less and subordinate in action or are in their essential power greater, whether they are contained...
in it only or really contain it, whether they are subsequent and
dependent on its previous appearance or only that in their ap-
parent organisation here but in real being and power anterior
to it and Matter itself dependent on the essential pre-existence
of life and mind. A greater question comes, whether mind itself
is the last term or there is something beyond, whether soul is
only an apparent result and phenomenon of the interaction of
mind, life and body or we have here an independent term of
our being and of all being, greater, anterior, ultimate, all matter
containing and contained in a secret spiritual consciousness,
spirit the first, last and eternal, the Alpha and the Omega, the
OM. For experiential philosophy either Matter, Mind, Life or
Spirit may be the Being, but none of these higher principles can
be made securely the basis of our thought against all intellectual
questioning until the materialistic hypothesis has first been given
a chance and tested. That may in the end turn out to have been
the use of the materialistic investigation of the universe and its
inquiry the greatest possible service to the finality of the spiritual
explanation of existence. In any case materialistic science and
philosophy have been after all a great and austere attempt to
know dispassionately and to see impersonally. They have denied
much that is being reaffirmed, but the denial was the condition
of a severer effort of knowledge and it may be said of them,
as the Upanishad says of Bhrigu the son of Varuna, sa tapas
taptva anam brahma vyajananat. “He having practised austerity
discovered that Matter was the Brahman.”

The gates of escape by which a knowledge starting from
materialism can get away from its own self-immuring limita-
tions, can here only be casually indicated. I may take another
occasion to show how the possibility must become in eventual
fact a necessity. Physical science has before its eye two eternal
factors of existence, Matter and Energy, and no others at all are
needed in the account of its operations. Mind dealing with the
facts and relations of Matter and Energy as they are arranged
to the senses in experience and continuative experiment and
are analysed by the reason, would be a sufficient definition of
physical science. Its first regard is on Matter as the one principle
of being and on Energy only as a phenomenon of Matter; but in the end one questions whether it is not the other way round, all things the action of Energy and Matter only the field, body and instrument of her workings. The first view is quantitative and purely mechanical, the second lets in a qualitative and a more spiritual element. We do not at once leap out of the materialistic circle, but we see an opening in it which may widen into an outlet when, stirred by this suggestion, we look at life and mind not merely as phenomenon in Matter but as energies and see that they are quite other energies than the material with their own peculiar qualities, powers and workings. If indeed all action of life and mind could be reduced, as it was once hoped, to none but material, quantitative and mechanical, to mathematical, physiological and chemical terms, the opening would cease to be an outlet; it would be choked. That attempt has failed and there is no sign of its ever being successful. Only a limited range of the phenomena of life and mind could be satisfied by a purely bio-physical, psycho-physical or bio-psychical explanation, and even if more could be dealt with by these data, still they would only have been accounted for on one side of their mystery, the lower end. Life and Mind, like the Vedic Agni, have their two extremities hidden in a secrecy, and we should by this way only have hold of the tail-end: the head would still be mystic and secret. To know more we must have studied not only the actual or possible action of body and matter on mind and life, but explored all the possible action of mind too on life and body; that opens undreamed vistas. And there is always the vast field of the action of mind in itself and on itself, which needs for its elucidation another, a mental, a psychic science.

Having examined and explained Matter by physical methods and in the language of the material Brahman,—it is not really explained, but let that pass,—having failed to carry that way of knowledge into other fields beyond a narrow limit, we must then at least consent to scrutinise life and mind by methods appropriate to them and explain their facts in the language and tokens of the vital and mental Brahman. We may discover then
where and how these tongues of the one existence render the same truth and throw light on each other’s phrases, and discover too perhaps another, high, brilliant and revealing speech which may shine out as the definitive all-explaining word. That can only be if we pursue these other sciences too in the same spirit as the physical, with a scrutiny, not only of their obvious and first actual phenomena, but of all the countless untested potentialities of mental and psychic energy, and with a free unlimited experimentation. We shall find out that their ranges of the unknown are immense. We shall perceive that until the possibilities of mind and spirit are better explored and their truths better known, we cannot yet pronounce the last all-ensphering formula of universal existence. Very early in this process the materialistic circle will be seen opening up on all its sides until it rapidly breaks up and disappears. Adhering still to the essential rigorous method of science, though not to its purely physical instrumentation, scrutinising, experimenting, holding nothing for established which cannot be scrupulously and universally verified, we shall still arrive at supraphysical certitudes. There are other means, there are greater approaches, but this line of access too can lead to the one universal truth.

Three things will remain from the labour of the secularist centuries; truth of the physical world and its importance, the scientific method of knowledge, — which is to induce Nature and Being to reveal their own way of being and proceeding, not hastening to put upon them our own impositions of idea and imagination, adhyāropa, — and last, though very far from least, the truth and importance of the earth life and the human endeavour, its evolutionary meaning. They will remain, but will turn to another sense and disclose greater issues. Surer of our hope and our labour, we shall see them all transformed into light of a vaster and more intimate world-knowledge and self-knowledge.
Thoughts and Glimpses
Aphorisms

THE GOAL

When we have passed beyond knowings, then we shall have Knowledge. Reason was the helper; Reason is the bar.

When we have passed beyond willings, then we shall have Power. Effort was the helper; Effort is the bar.

When we have passed beyond enjoyings, then we shall have Bliss. Desire was the helper; Desire is the bar.

When we have passed beyond individualising, then we shall be real Persons. Ego was the helper; Ego is the bar.

When we have passed beyond humanity, then we shall be the Man. The Animal was the helper; the Animal is the bar.

Transform reason into ordered intuition; let all thyself be light. This is thy goal.

Transform effort into an easy and sovereign overflowing of the soul-strength; let all thyself be conscious force. This is thy goal.

Transform enjoying into an even and objectless ecstasy; let all thyself be bliss. This is thy goal.

Transform the divided individual into the world-personality; let all thyself be the divine. This is thy goal.

Transform the Animal into the Driver of the herds; let all thyself be Krishna. This is thy goal.

* * *

www.holybooks.com
What I cannot do now is the sign of what I shall do hereafter. The sense of impossibility is the beginning of all possibilities. Because this temporal universe was a paradox and an impossibility, therefore the Eternal created it out of His being.

Impossibility is only a sum of greater unrealised possibles. It veils an advanced stage and a yet unaccomplished journey.

If thou wouldst have humanity advance, buffet all preconceived ideas. Thought thus smitten awakes and becomes creative. Otherwise it rests in a mechanical repetition and mistakes that for its right activity.

To rotate on its own axis is not the one movement for the human soul. There is also its wheeling round the Sun of an inexhaustible illumination.

Be conscious first of thyself within, then think and act. All living thought is a world in preparation; all real act is a thought manifested. The material world exists because an Idea began to play in divine self-consciousness.

Thought is not essential to existence nor its cause, but it is an instrument for becoming; I become what I see in myself. All that thought suggests to me, I can do; all that thought reveals in me, I can become. This should be man’s unshakable faith in himself, because God dwells in him.

Not to go on for ever repeating what man has already done is our work, but to arrive at new realisations and undreamed-of masteries. Time and soul and world are given us for our field, vision and hope and creative imagination stand for our prompters, will and thought and labour are our all-effective instruments.

What is there new that we have yet to accomplish? Love, for as yet we have only accomplished hatred and self-pleasing; Knowledge, for as yet we have only accomplished error and perception and conceiving; Bliss, for as yet we have only accomplished pleasure and pain and indifference; Power, for as yet we have
only accomplished weakness and effort and a defeated victory; Life, for as yet we have only accomplished birth and growth and dying; Unity, for as yet we have only accomplished war and association.

In a word, godhead; to remake ourselves in the divine image.

THE DELIGHT OF BEING

If Brahman were only an impersonal abstraction eternally contradicting the apparent fact of our concrete existence, cessation would be the right end of the matter; but love and delight and self-awareness have also to be reckoned.

The universe is not merely a mathematical formula for working out the relation of certain mental abstractions called numbers and principles to arrive in the end at a zero or a void unit, neither is it merely a physical operation embodying certain equations of forces. It is the delight of a Self-lover, the play of a Child, the endless self-multiplication of a Poet intoxicated with the rapture of His own power of endless creation.

We may speak of the Supreme as if He were a mathematician working out a cosmic sum in numbers or a thinker resolving by experiment a problem in relations of principles and the balance of forces: but also we should speak of Him as if He were a lover, a musician of universal and particular harmonies, a child, a poet. The side of thought is not enough; the side of delight too must be entirely grasped: Ideas, Forces, Existences, Principles are hollow moulds unless they are filled with the breath of God's delight.

These things are images, but all is an image. Abstractions give us the pure conception of God's truths; images give us their living reality.

If Idea embracing Force begot the worlds, Delight of Being begot the Idea. Because the Infinite conceived an innumerable delight in itself, therefore worlds and universes came into existence.
Consciousness of being and Delight of being are the first parents. Also, they are the last transcendences. Unconsciousness is only an intermediate swoon of the conscious or its obscure sleep; pain and self-extinction are only delight of being running away from itself in order to find itself elsewhere or otherwise.

Delight of being is not limited in Time; it is without end or beginning. God comes out from one form of things only to enter into another.

What is God after all? An eternal child playing an eternal game in an eternal garden.

**MAN, THE PURUSHA**

God cannot cease from leaning down towards Nature, nor man from aspiring towards the Godhead. It is the eternal relation of the finite to the infinite. When they seem to turn from each other, it is to recoil for a more intimate meeting.

In man nature of the world becomes again self-conscious so that it may take the great leap towards its Enjoyer. This is the Enjoyer whom unknowingly it possesses, whom life and sensation possessing deny and denying seek. Nature of the world knows not God only because it knows not itself; when it knows itself, it shall know unalloyed delight of being.

Possession in oneness and not loss in oneness is the secret. God and Man, World and Beyond-world become one when they know each other. Their division is the cause of ignorance as ignorance is the cause of suffering.

Man seeks at first blindly and does not even know that he is seeking his divine self; for he starts from the obscurity of material Nature and even when he begins to see, he is long blinded by the light that is increasing in him. God too answers obscurely to his search; He seeks and enjoys man’s blindness like the hands of a little child that grope after its mother.
God and Nature are like a boy and girl at play and in love. They hide and run from each other when glimpsed so that they may be sought after and chased and captured.

Man is God hiding himself from Nature so that he may possess her by struggle, insistence, violence and surprise. God is universal and transcendent Man hiding himself from his own individuality in the human being.

The animal is Man disguised in a hairy skin and upon four legs; the worm is Man writhing and crawling towards the evolution of his Manhood. Even crude forms of Matter are Man in his inchoate body. All things are Man, the Purusha.

For what do we mean by Man? An uncreated and indestructible soul that has housed itself in a mind and body made of its own elements.

THE END

The meeting of man and God must always mean a penetration and entry of the divine into the human and a self-immersion of man in the Divinity.

But that immersion is not in the nature of an annihilation. Extinction is not the fulfilment of all this search and passion, suffering and rapture. The game would never have been begun if that were to be its ending.

Delight is the secret. Learn of pure delight and thou shalt learn of God.

What then was the commencement of the whole matter? Existence that multiplied itself for sheer delight of being and plunged into numberless trillions of forms so that it might find itself innumerably.

And what is the middle? Division that strives towards a multiple unity, ignorance that labours towards a flood of varied light, pain
that travails towards the touch of an unimaginable ecstasy. For all these things are dark figures and perverse vibrations.

And what is the end of the whole matter? As if honey could taste itself and all its drops together and all its drops could taste each other and each the whole honeycomb as itself, so should the end be with God and the soul of man and the universe.

Love is the keynote, Joy is the music, Power is the strain, Knowledge is the performer, the infinite All is the composer and audience. We know only the preliminary discords which are as fierce as the harmony shall be great; but we shall arrive surely at the fugue of the divine Beatitudes.

THE CHAIN

The whole world yearns after freedom, yet each creature is in love with his chains; this is the first paradox and inextricable knot of our nature.

Man is in love with the bonds of birth; therefore he is caught in the companion bonds of death. In these chains he aspires after freedom of his being and mastery of his self-fulfilment.

Man is in love with power; therefore he is subjected to weakness. For the world is a sea of waves of force that meet and continually fling themselves on each other; he who would ride on the crest of one wave, must faint under the shock of hundreds.

Man is in love with pleasure; therefore he must undergo the yoke of grief and pain. For unmixed delight is only for the free and passionless soul; but that which pursues after pleasure in man is a suffering and straining energy.

Man hungers after calm, but he thirsts also for the experiences of a restless mind and a troubled heart. Enjoyment is to his mind a fever, calm an inertia and a monotony.
Man is in love with the limitations of his physical being, yet he would have also the freedom of his infinite mind and his immortal soul.

And in these contrasts something in him finds a curious attraction; they constitute for his mental being the artistry of life. It is not only the nectar but the poison also that attracts his taste and his curiosity.

* * *

In all these things there is a meaning and for all these contradictions there is a release. Nature has a method in every madness of her combinings and for her most inextricable knots there is a solution.

Death is the question Nature puts continually to Life and her reminder to it that it has not yet found itself. If there were no siege of death, the creature would be bound for ever in the form of an imperfect living. Pursued by death he awakes to the idea of perfect life and seeks out its means and its possibility.

Weakness puts the same test and question to the strengths and energies and greatnesses in which we glory. Power is the play of life, shows its degree, finds the value of its expression; weakness is the play of death pursuing life in its movement and stressing the limit of its acquired energy.

Pain and grief are Nature’s reminder to the soul that the pleasure it enjoys is only a feeble hint of the real delight of existence. In each pain and torture of our being is the secret of a flame of rapture compared with which our greatest pleasures are only as dim flickerings. It is this secret which forms the attraction for the soul of the great ordeals, sufferings and fierce experiences of life which the nervous mind in us shuns and abhors.

The restlessness and early exhaustion of our active being and its instruments are Nature’s sign that calm is our true foundation
and excitement a disease of the soul; the sterility and monotony of mere calm is her hint that play of the activities on that firm foundation is what she requires of us. God plays for ever and is not troubled.

The limitations of the body are a mould; soul and mind have to pour themselves into them, break them and constantly remould them in wider limits till the formula of agreement is found between this finite and their own infinity.

Freedom is the law of being in its illimitable unity, secret master of all Nature; servitude is the law of love in the being voluntarily giving itself to serve the play of its other selves in the multiplicity.

It is when freedom works in chains and servitude becomes a law of Force, not of Love, that the true nature of things is distorted and a falsehood governs the soul's dealings with existence.

Nature starts with this distortion and plays with all the combinations to which it can lead before she will allow it to be righted. Afterwards she gathers up all the essence of these combinations into a new and rich harmony of love and freedom.

Freedom comes by a unity without limits; for that is our real being. We may gain the essence of this unity in ourselves; we may realise the play of it in oneness with all others. The double experience is the complete intention of the soul in Nature.

Having realised infinite unity in ourselves, then to give ourselves to the world is utter freedom and absolute empire.

Infinite, we are free from death; for life then becomes a play of our immortal existence. We are free from weakness; for we are the whole sea enjoying the myriad shock of its waves. We are free from grief and pain; for we learn how to harmonise our being with all that touches it and to find in all things action and reaction of the delight of existence. We are free from limitation; for the body becomes a plaything of the infinite mind and learns to obey the will of the immortal soul. We are free from the fever of the nervous mind and the heart, yet are not bound to immobility.
Immortality, unity and freedom are in ourselves and await there our discovery; but for the joy of love God in us will still remain the Many.
Thoughts and Glimpses

Some think it presumption to believe in a special Providence or to look upon oneself as an instrument in the hands of God, but I find that every man has a special Providence and I see that God uses the mattock of the labourer and babbles in the mouth of a little child.

Providence is not only that which saves me from the shipwreck in which everybody else has foundered. Providence is also that which while all others are saved snatches away my last plank of safety and drowns me in the solitary ocean.

The delight of victory is sometimes less than the attraction of struggle and suffering; nevertheless the laurel and not the cross should be the aim of the conquering human soul.

Souls that do not aspire are God’s failures; but Nature is pleased and loves to multiply them because they assure her of stability and prolong her empire.

Those who are poor, ignorant, ill-born or ill-bred are not the common herd; the common herd are all who are satisfied with pettiness and an average humanity.

Help men, but do not pauperise them of their energy; lead and instruct men, but see that their initiative and originality remain intact; take others into thyself, but give them in return the full godhead of their nature. He who can do this is the leader and the guru.

God has made the world a field of battle and filled it with the trampling of combatants and the cries of a great wrestle and struggle. Would you filch His peace without paying the price He has fixed for it?
Distrust a perfect-seeming success, but when having succeeded thou findest still much to do, rejoice and go forward; for the labour is long before the real perfection.

There is no more benumbing error than to mistake a stage for the goal or to linger too long in a resting-place.

* *

* *

Wherever thou seest a great end, be sure of a great beginning. Where a monstrous and painful destruction appals thy mind, console it with the certainty of a large and great creation. God is there not only in the still small voice, but in the fire and in the whirlwind.

The greater the destruction, the freer the chances of creation; but the destruction is often long, slow and oppressive, the creation tardy in its coming or interrupted in its triumph. The night returns again and again and the day lingers or seems even to have been a false dawning. Despair not therefore, but watch and work. Those who hope violently, despair swiftly: neither hope nor fear, but be sure of God’s purpose and thy will to accomplish.

The hand of the divine Artist works often as if it were unsure of its genius and its material. It seems to touch and test and leave, to pick up and throw away and pick up again, to labour and fail and botch and repiece together. Surprises and disappointments are the order of his work before all things are ready. What was selected, is cast away into the abyss of reprobation; what was rejected, becomes the corner-stone of a mighty edifice. But behind all this is the sure eye of a knowledge which surpasses our reason and the slow smile of an infinite ability.

God has all time before him and does not need to be always in a hurry. He is sure of his aim and success and cares not if he break his work a hundred times to bring it nearer perfection. Patience is our first great necessary lesson, but not the dull slowness to
move of the timid, the sceptical, the weary, the slothful, the unambitious or the weakling; a patience full of a calm and gathering strength which watches and prepares itself for the hour of swift great strokes, few but enough to change destiny.

Wherefore God hammers so fiercely at his world, tramples and kneads it like dough, casts it so often into the blood-bath and the red hell-heat of the furnace? Because humanity in the mass is still a hard, crude and vile ore which will not otherwise be smelted and shaped: as is his material, so is his method. Let it help to transmute itself into nobler and purer metal, his ways with it will be gentler and sweeter, much loftier and fairer its uses.

Wherefore he selected or made such a material, when he had all infinite possibility to choose from? Because of his divine Idea which saw before it not only beauty and sweetness and purity, but also force and will and greatness. Despise not force, nor hate it for the ugliness of some of its faces, nor think that love only is God. All perfect perfection must have something in it of the stuff of the hero and even of the Titan. But the greatest force is born out of the greatest difficulty.

* * *

All would change if man could once consent to be spiritualised; but his nature mental and vital and physical is rebellious to the higher law. He loves his imperfections.

The Spirit is the truth of our being; mind and life and body in their imperfection are its masks, but in their perfection should be its moulds. To be spiritual only is not enough; that prepares a number of souls for heaven, but leaves the earth very much where it was. Neither is a compromise the way of salvation.

The world knows three kinds of revolution. The material has strong results, the moral and intellectual are infinitely larger in their scope and richer in their fruits, but the spiritual are the great sowings.
If the triple change could coincide in a perfect correspondence, a faultless work would be done; but the mind and body of mankind cannot hold perfectly a strong spiritual inrush: most is spilt, much of the rest is corrupted. Many intellectual and physical upturnings of our soil are needed to work out a little result from a large spiritual sowing.

Each religion has helped mankind. Paganism increased in man the light of beauty, the largeness and height of his life, his aim at a many-sided perfection; Christianity gave him some vision of divine love and charity; Buddhism has shown him a noble way to be wiser, gentler, purer, Judaism and Islam how to be religiously faithful in action and zealously devoted to God; Hinduism has opened to him the largest and profoundest spiritual possibilities. A great thing would be done if all these God-visions could embrace and cast themselves into each other; but intellectual dogma and cult egoism stand in the way.

All religions have saved a number of souls, but none yet has been able to spiritualise mankind. For that there is needed not cult and creed, but a sustained and all-comprehending effort at spiritual self-evolution.

The changes we see in the world today are intellectual, moral, physical in their ideal and intention: the spiritual revolution waits for its hour and throws up meanwhile its waves here and there. Until it comes the sense of the others cannot be understood and till then all interpretation of present happening and forecast of man’s future are vain things. For its nature, power, event are that which will determine the next cycle of our humanity.
Heraclitus
HERACLITUS

THE PHILOSOPHY and thought of the Greeks is perhaps the most intellectually stimulating, the most fruitful of clarities the world has yet had. Indian philosophy was intuitive in its beginnings, stimulative rather to the deeper vision of things,—nothing more exalted and profound, more revelatory of the depths and the heights, more powerful to open unending vistas has ever been conceived than the divine and inspired Word, the mantra of Veda and Vedanta. When that philosophy became intellectual, precise, founded on the human reason, it became also rigidly logical, enamoured of fixity and system, desirous of a sort of geometry of thought. The ancient Greek mind had instead a kind of fluid precision, a flexibly inquiring logic; acuteness and the wide-open eye of the intellect were its leading characteristics and by this power in it it determined the whole character and field of subsequent European thinking. Nor is any Greek thinker more directly stimulating than the aphoristic philosopher Heraclitus; and yet he keeps and adds to this more modern intellectual stimulativeness something of the antique psychic and intuitive vision and word of the older Mystics. The trend to rationalism is there, but not yet that fluid clarity of the reasoning mind which was the creation of the Sophists.

Professor R. D. Ranade has recently published a small treatise on the philosophy of Heraclitus. From the paging of the treatise it seems to be an excerpt, but from what there is nothing to tell. It is perhaps too much to hope that it is from a series of essays on philosophers or a history of philosophy by this perfect writer and scholar. At any rate such a work from such a hand would be a priceless gain. For Professor Ranade possesses in a superlative degree the rare gift of easy and yet adequate exposition; but he has more than this, for he can give a fascinating
interest to subjects like philology and philosophy which to the ordinary reader seem harsh, dry, difficult and repellent. He joins to a luminous clarity, lucidity and charm of expression an equal luminousness and just clarity of presentation and that perfect manner in both native to the Greek and French language and mind, but rare in the English tongue. In these seventeen pages he has presented the thought of the old enigmatic Ephesian with a clearness and sufficiency which leaves us charmed, enlightened and satisfied.

On one or two difficult points I am inclined to differ with the conclusions he adopts. He rejects positively Pfeiderer’s view of Heraclitus as a mystic, which is certainly exaggerated and, as stated, a misconception; but it seems to me that there is behind that misconception a certain truth. Heraclitus’ abuse of the mysteries of his time is not very conclusive in this respect; for what he reviles is those aspects of obscure magic, physical ecstasy, sensual excitement which the Mysteries had put on in some at least of their final developments as the process of degeneration increased which made a century later even the Eleusinian a butt for the dangerous mockeries of Alcibiades and his companions. His complaint is that the secret rites which the populace held in ignorant and superstitious reverence “unholy mysticise what are held among men as mysteries.” He rebels against the darkness of the Dionysian ecstasy in the approach to the secrets of Nature; but there is a luminous Apollonian as well as an obscure and sometimes dangerous Dionysian mysticism, a Dakshina as well as a Vama Marga of the mystic Tantra. And though no partaker in or supporter of any kind of rites or mummery, Heraclitus still strikes one as at least an intellectual child of the Mystics and of mysticism, although perhaps a rebel son in the house of his mother. He has something of the mystic style, something of the intuitive Apollonian inlook into the secrets of existence.

Certainly, as Mr. Ranade says, mere aphorism is not mysticism; aphorism and epigram are often enough, perhaps usually a condensed or a pregnant effort of the intellect. But Heraclitus’ style, as Mr. Ranade himself describes it, is not only aphoristic and epigrammatic but cryptic, and this cryptic character is not
merely the self-willed obscurity of an intellectual thinker affecting an excessive condensation of his thought or a too closely-packed burden of suggestiveness. It is enigmatic in the style of the mystics, enigmatic in the manner of their thought which sought to express the riddle of existence in the very language of the riddle. What for instance is the “ever-living Fire” in which he finds the primary and imperishable substance of the universe and identifies it in succession with Zeus and with eternity? or what should we understand by “the thunderbolt which steers all things”? To interpret this fire as merely a material force of heat and flame or simply a metaphor for being which is eternal becoming is, it seems to me, to miss the character of Heraclitus’ utterances. It includes both these ideas and everything that connects them. But then we get back at once to the Vedic language and turn of thought; we are reminded of the Vedic Fire which is hymned as the upbuilder of the worlds, the secret Immortal in men and things, the periphery of the gods, Agni who “becomes” all around the other immortals, himself becomes and contains all the gods; we are reminded of the Vedic thunderbolt, that electric Fire, of the Sun who is the true Light, the Eye, the wonderful weapon of the divine pathfinders Mitra and Varuna. It is the same cryptic form of language, the same brief and abundant method of thought even; though the conceptions are not identical, there is a clear kinship.

The mystical language has always this disadvantage that it readily becomes obscure, meaningless or even misleading to those who have not the secret and to posterity a riddle. Mr. Ranade tells us that it is impossible to make out what Heraclitus meant when he said, “The gods are mortals, men immortals.” But is it quite impossible if we do not cut off this thinker from the earlier thought of the mystics? The Vedic Rishi also invokes the Dawn, “O goddess and human”; the gods in the Veda are constantly addressed as “men”, the same words are traditionally applied to indicate men and immortals. The immanence of the immortal principle in man, the descent of the gods into the workings of mortality was almost the fundamental idea of the mystics. Heraclitus, likewise, seems to
recognise the inextricable unity of the eternal and the transitory, that which is for ever and yet seems to exist only in this strife and change which is a continual dying. The gods manifest themselves as things that continually change and perish; man is in principle an eternal being. Heraclitus does not really deal in barren antitheses; his method is a statement of antinomies and an adumbrating of their reconciliation in the very terms of opposition. Thus when he says that the name of the bow (biōs) is life (bíos), but its work is death, obviously he intends no mere barren play upon words; he speaks of that principle of war, father of all and king of all, which makes cosmic existence an apparent process of life, but an actual process of death. The Upanishads seized hold of the same truth when they declared life to be the dominion of King Death, described it as the opposite of immortality and even related that all life and existence here were first created by Death for his food.

Unless we bear in mind this pregnant and symbolic character of Heraclitus' language we are likely to sterilise his thought by giving it a too literal sense. Heraclitus praises the “dry soul” as the wisest and best, but, he says, it is a pleasure and satisfaction to souls to become moist. This inclination of the soul to its natural delight in a sort of wine-drenched laxity must be discouraged; for Dionysus the wine-god and Hades, the Lord of Death, the Lord of the dark underworld, are one and the same deity. Professor Ranade takes this eulogy of the dry soul as praise of the dry light of reason; he finds in it a proof that Heraclitus was a rationalist and not a mystic: yet strangely enough he takes the parallel and opposite expressions about the moist soul and Dionysus in a quite different and material sense, as an ethical disapprobation of wine-drinking. Surely, it cannot be so; Heraclitus cannot mean by the dry soul the reason of a sober man and by a moist soul the non-reason or bewildered reason of the drunkard; nor when he says that Hades and Dionysus are the same, is he simply discouraging the drinking of wine as fatal to the health! Evidently he employs here, as always, a figurative
Heraclitus ± 1 219

and symbolic language because he has to convey a deeper thought for which he finds ordinary language too poor and superficial.

Heraclitus is using the old language of the Mysteries, though in his own new way and for his own individual purpose, when he speaks of Hades and Dionysus and the everliving Fire or of the Furies, the succourers of Justice who will find out the Sun if he oversteps his measure. We miss his sense, if we see in these names of the gods only the poorer superficial meanings of the popular mythological religion. When Heraclitus speaks of the dry or the moist soul, it is of the soul and not the intellect that he is thinking, psuchē and not nous. Psuchē corresponds roughly to the cetas or citta of Indian psychology, nous to buddhi; the dry soul of the Greek thinker to the purified heart-consciousness, śuddha citta, of the Indian psychologists, which in their experience was the first basis for a purified intellect, viśuddha buddhi. The moist soul is that which allows itself to be perturbed by the impure wine of sense ecstasy, emotional excitement, an obscure impulse and inspiration whose source is from a dark underworld. Dionysus is the god of this wine-born ecstasy, the god of the Bacchic mysteries,—of the “walkers in the night, mages, bacchanals, mystics”: therefore Heraclitus says that Dionysus and Hades are one. In an opposite sense the ecstatic devotee of the Bhakti path in India reproaches the exclusive seeker by the way of thought-discrimination with his “dry knowledge”, using Heraclitus’ epithet, but with a pejorative and not a laudatory significance.

To ignore the influence of the mystic thought and its methods of self-expression on the intellectual thinking of the Greeks from Pythagoras to Plato is to falsify the historical procession of the human mind. It was enveloped at first in the symbolic, intuitive, esoteric style and discipline of the Mystics,—Vedic and Vedantic seers, Orphic secret teachers, Egyptian priests. From that veil it emerged along the path of a metaphysical philosophy still related to the Mystics by the source of its fundamental ideas, its first aphoristic and cryptic style, its attempt to seize directly upon truth by intellectual vision rather than arrive at it by careful
ratiocination, but nevertheless intellectual in its method and aim. This is the first period of the Darshanas in India, in Greece of the early intellectual thinkers. Afterwards came the full tide of philosophic rationalism, Buddha or the Buddhists and the logical philosophers in India, in Greece the Sophists and Socrates with all their splendid progeny; with them the intellectual method did not indeed begin, but came to its own and grew to its fullness. Heraclitus belongs to the transition, not to the noontide of the reason; he is even its most characteristic representative. Hence his cryptic style, hence his brief and burdened thought and the difficulty we feel when we try to clarify and entirely rationalise his significances. The ignoring of the Mystics, our pristine fathers, pūrve pītaraḥ, is the great defect of the modern account of our thought-evolution.
WHAT PRECISELY is the key-note of Heraclitus’ thinking, where has he found his starting-point, or what are the grand lines of his philosophy? For if his thought is not developed in the severe systematic method of later thinkers, if it does not come down to us in large streams of subtle reasoning and opulent imagery like Plato’s but in detached aphoristic sentences aimed like arrows at truth, still they are not really scattered philosophical reflections. There is an inter-relation, an inter-dependence; they all start logically from his fundamental view of existence itself and go back to it for their constant justification.

As in Indian, so in Greek philosophy the first question for thought was the problem of the One and the Many. We see everywhere a multiplicity of things and beings; is it real or only phenomenal or practical, \textit{māyā}, \textit{vyavahāra}? Has individual man, for instance,—the question which concerns us most nearly,—an essential and immortal existence of his own or is he simply a phenomenal and transient result in the evolution or play of some one original principle, Matter, Mind, Spirit, which is the only real reality of existence? Does unity exist at all and, if so, is it a unity of sum or of primordial principle, a result or an origin, a oneness of totality or a oneness of nature or a oneness of essence,—the various standpoints of Pluralism, of Sankhya, of Vedanta? Or if both the One and the Many are real, what are the relations between these two eternal principles of being, or are they reconciled in an Absolute beyond them? These are no barren questions of logic, no battle of cloudy metaphysical abstractions, as the practical and sensational man would have us contemptuously believe; for on our answer to them depends our conception of God, of existence, of the world and of human life and destiny.
Heraclitus, differing in this, as Mr. Ranade reminds us, from Anaximander who like our Mayavadins denied true reality to the Many and from Empedocles who thought the All to be alternately one and many, believed unity and multiplicity to be both of them real and coexistent. Existence is then eternally one and eternally many,—even as Ramanuja and Madhwa have concluded, though in a very different spirit and from a quite different standpoint. Heraclitus' view arose from his strong concrete intuition of things, his acute sense of universal realities; for in our experience of the cosmos we do find always and inseparably this eternal coexistence and cannot really escape from it. Everywhere our gaze on the Many reveals to us an eternal oneness, no matter what we fix on as the principle of that oneness; yet is that unity inoperative except by the multiplicity of its powers and forms, nor do we anywhere see it void of or apart from its own multiplicity. One Matter, but many atoms, plasms, bodies; one Energy, but many forces; one Mind or at least Mind-stuff, but many mental beings; one Spirit, but many souls. Perhaps periodically this multiplicity goes back, is dissolved into, is swallowed up by the One from which it was originally evolved; but still the fact that it has evolved and got involved again, compels us to suppose a possibility and even a necessity of its renewed evolution: it is not then really destroyed. The Adwaitin by his Yoga goes back to the One, feels himself merged, believes that he has got rid of the Many, proved perhaps their unreality; but it is the achievement of an individual, of one of the Many, and the Many go on existing in spite of it. The achievement proves only that there is a plane of consciousness on which the soul can realise and not merely perceive by the intellect the oneness of the Spirit, and it proves nothing else. Therefore, on this truth of eternal oneness and eternal multiplicity Heraclitus fixes and anchors himself; from his firm acceptance of it, not reasoning it away but accepting all its consequences, flows all the rest of his philosophy.

Still, one question remains to be resolved before we can move a step farther. Since there is an eternal One, what is that?
Is it Force, Mind, Matter, Soul? or, since Matter has many principles, is it some one principle of Matter which has evolved all the rest or which by some power of its own activity has changed into all that we see? The old Greek thinkers conceived of cosmic Substance as possessed of four elements, omitting or not having arrived at the fifth, Ether, in which Indian analysis found the first and original principle. In seeking the nature of the original substance they fixed then on one or other of these four as the primordial Nature, one finding it in Air, another in Water, while Heraclitus, as we have seen, describes or symbolises the source and reality of all things as an everliving Fire. “No man or god” he says “has created the universe, but ever there was and is and will be the everliving Fire.”

In the Veda, in the early language of the Mystics generally, the names of the elements or primary principles of Substance were used with a clearly symbolic significance. The symbol of water is thus used constantly in the Rig Veda. It is said that in the beginning was the inconscient Ocean out of which the One was born by the vastness of His energy; but it is clear from the language of the hymn that no physical ocean is meant, but rather the unformed chaos of inconscient being in which the Divine, the Godhead lay concealed in a darkness enveloped by greater darkness. The seven active principles of existence are similarly spoken of as rivers or waters; we hear of the seven rivers, the great water, the four superior rivers, in a context which shows their symbolic significance. We see this image fixed in the Puranic mythus of Vishnu sleeping on the serpent Infinite in the milky ocean. But even as early as the Rig Veda, ether is the highest symbol of the Infinite, the apeiron of the Greeks; water is that of the same Infinite in its aspect as the original substance; fire is the creative power, the active energy of the Infinite; air, the life-principle, is spoken of as that which brings down fire out of the ethereal heavens into the earth. Yet these were not merely symbols. The Vedic Mystics held, it is clear, a close connection and effective parallelism to exist between psychical and physical activities, between the action of Light, for instance, and the phenomena of mental illumination; fire
was to them at once the luminous divine energy, the Seer-Will of the universal Godhead active and creative of all things, and the physical principle creative of the substantial forms of the universe, burning secretly in all life.

It is doubtful how far the earlier Greek philosophic thinkers preserved any of these complex conceptions in their generalisations about the original principle. But Heraclitus has clearly an idea of something more than a physical substance or energy in his concept of the everliving Fire. Fire is to him the physical aspect, as it were, of a great burning creative, formative and destructive force, the sum of all whose processes is a constant and unceasing change. The idea of the One which is eternally becoming Many and the Many which is eternally becoming One and of that One therefore not so much as stable substance or essence as active Force, a sort of substantial Will-to-become, is the foundation of Heraclitus’ philosophy.

Nietzsche, whom Mr. Ranade rightly affiliates to Heraclitus, Nietzsche, the most vivid, concrete and suggestive of modern thinkers, as is Heraclitus among the early Greeks, founded his whole philosophical thought on this conception of existence as a vast Will-to-become and of the world as a play of Force; divine Power was to him the creative Word, the beginning of all things and that to which life aspires. But he affirms Becoming only and excludes Being from his view of things; hence his philosophy is in the end unsatisfactory, insufficient, lop-sided; it stimulates, but solves nothing. Heraclitus does not exclude Being from the data of the problem of existence, although he will not make any opposition or gulf between that and Becoming. By his conception of existence as at once one and many, he is bound to accept these two aspects of his everliving Fire as simultaneously true, true in each other; Being is an eternal becoming and yet the Becoming resolves itself into eternal being. All is in flux, for all is change of becoming; we cannot step into the same waters twice, for it is other and yet other waters that are flowing on. And yet, with his keen eye on the truth of things, preoccupied though he was with this aspect of existence, he could not help seeing another truth behind it. The waters into which we step,
are and are not the same; our own existence is an eternity and an inconstant transience; we are and we are not. Heraclitus does not solve the contradiction; he states it and in his own way tries to give some account of its process.

That process he sees as a constant change and a changing back, an exchange and an interchange in a constant whole,—managed for the rest by a clash of forces, by a creative and determinative strife, “war which is the father and king of all things.” Between Fire as the Being and Fire in the Becoming existence describes a downward and upward movement — *pravr̥tti* and *nivṛtti* — which has been called the “back-returning road” upon which all travels. These are the master ideas of the thought of Heraclitus.
TWO APOPHTHEGMS of Heraclitus give us the starting-point of his whole thinking. They are his saying that it is wisdom to admit that all things are one and his other saying “One out of all and all out of One.” How are we to understand these two pregnant utterances? Must we read them into each other and conclude that for Heraclitus the One only exists as resultant of the many even as the many only exist as a becoming of the One? Mr. Ranade seems to think so; he tells us that this philosophy denies Being and affirms only Becoming,—like Nietzsche, like the Buddhists. But surely this is to read a little too much into Heraclitus’ theory of perpetual change, to take it too much by itself. If that was his whole belief, it is difficult to see why he should seek for an original and eternal principle, the everliving Fire which creates all by its perpetual changing, governs all by its fiery force of the “thunderbolt”, resolves all back into itself by a cyclic conflagration, difficult to account for his theory of the upward and downward way, difficult to concede what Mr. Ranade contends, that Heraclitus did hold the theory of a cosmic conflagration or to imagine what could be the result of such a cosmic catastrophe. To reduce all becoming into Nothing? Surely not; Heraclitus’ thought is at the very antipodes from speculative Nihilism. Into another kind of becoming? Obviously not, since by an absolute conflagration existing things can only be reduced into their eternal principle of being, into Agni, back into the immortal Fire. Something that is eternal, that is itself eternity, something that is for ever one,—for the cosmos is eternally one and many and does not by becoming cease to be one,—something that is God (Zeus), something that can be imaged as Fire which, if an ever-active force, is yet a substance or at least a substantial force and not merely an abstract Will-to-become,—something out of which
Heraclitus was greatly preoccupied with his idea of eternal becoming, for him the one right account of the cosmos, but his cosmos has still an eternal basis, a unique original principle. That distinguishes his thought radically from Nietzsche’s or the Buddhists’. The later Greeks derived from him the idea of the perpetual stream of things, “All things are in flux.” The idea of the universe as constant motion and unceasing change was always before him, and yet behind and in it all he saw too a constant principle of determination and even a mysterious principle of identity. Every day, he says, it is a new sun that rises; yes, but if the sun is always new, exists only by change from moment to moment, like all things in Nature, still it is the same everliving Fire that rises with each Dawn in the shape of the sun. We can never step again into the same stream, for ever other and other waters are flowing; and yet, says Heraclitus, “we do and we do not enter into the same waters, we are and we are not.” The sense is clear; there is an identity in things, in all existences, sarvabhūtānī, as well as a constant changing; there is a Being as well as a Becoming and by that we have an eternal and real existence as well as a temporary and apparent, are not merely a constant mutation but a constant identical existence. Zeus exists, a sempiternal active Fire and eternal Word, a One by which all things are unified, all laws and results perpetually determined, all measures unalterably maintained. Day and Night are one, Death and Life are one, Youth and Age are one, Good and Evil are one, because that is One and all these are only its various shapes and appearances.

Heraclitus would not have accepted a purely psychological principle of Self as the origin of things, but in essence he is not very far from the Vedantic position. The Buddhists of the Nihilistic school used in their own way the image of the stream and the image of the fire. They saw, as Heraclitus saw, that nothing in the world is for two moments the same even in the most insistent continuity of forms. The flame maintains itself unchanged in appearance, but every moment it is another and
not the same fire; the stream is sustained in its flow by ever new waters. From this they drew the conclusion that there is no essence of things, nothing self-existent; the apparent becoming is all that we can call existence, behind it there is eternal Nothing, the absolute Void, or perhaps an original Non-Being. Heraclitus saw, on the contrary, that if the form of the flame only exists by a constant change, a constant exchange rather of the substance of the wick into the substance of the fiery tongue, yet there must be a principle of their existence common to them which thus converts itself from one form into another; — even if the substance of the flame is always changing, the principle of Fire is always the same and produces always the same results of energy, maintains always the same measures.

The Upanishad too describes the cosmos as a universal motion and becoming; it is all this that is mobile in the mobility, \textit{jagatyāṁ jagat}, — the very word for universe, \textit{jagat}, having the radical sense of motion, so that the whole universe, the macro-cosm, is one vast principle of motion and therefore of change and instability, while each thing in the universe is in itself a micro-cosm of the same motion and instability. Existences are “all becomings”; the Self-existent Atman, Swayambhu, has become all becomings, \textit{ātmā eva abhūt sarvāṇi bhūtāni}. The relation between God and World is summed up in the phrase, “It is He that has moved out everywhere, \textit{sa paryagāt}; He is the Lord, the Seer and Thinker, who becoming everywhere — Heraclitus’ Logos, his Zeus, his One out of which come all things — “has fixed all things rightly according to their nature from years sempiternal”, — Heraclitus’ “All things are fixed and determined.” Substitute his Fire for the Vedantic Atman and there is nothing in the expressions of the Upanishad which the Greek thinker would not have accepted as another figure of his own thought. And do not the Upanishads use among other images this very symbol of the Fire? “As one Fire has entered into the world and taken shapes according to the various forms in the world,” so the one Being has become all these names and forms and yet remains the One. Heraclitus tells us precisely the same thing; God is all contraries, “He takes various shapes just as fire, when
it is mingled with spices, is named according to the savour of each.” Each one names Him according to his pleasure, says the Greek seer, and He accepts all names and yet accepts none, not even the highest name of Zeus. “He consents and yet at the same time does not consent to be called by the name of Zeus.”

So too said Indian Dirghatamas of old in his long hymn of the divine Mysteries in the Rig Veda, “One existent the sages call by many names.” Though He assumes all these forms, says the Upanishad, He has no form that the vision can seize, He whose name is a mighty splendour. We see again how close are the thoughts of the Greek and very often even his expressions and images to the sense and style of the Vedic and Vedantic sages.

We must put each of Heraclitus’ apophthegms into its right place if we would understand his thought. “It is wise to admit that all things are one,” — not merely, be it noted, that they came from oneness and will go back to oneness, but that they are one, now and always, — all is, was and ever will be the everliving Fire. All seems to our experience to be many, an eternal becoming of manifold existences; where is there in it any principle of eternal identity? True, says Heraclitus, so it seems; but wisdom looks beyond and does see the identity of all things; Night and Day, Life and Death, the good and the evil, all are one, the eternal, the identical; those who see only a difference in objects, do not know the truth of the objects they observe. “Hesiod did not know day and night; for it is the One,” — esti gar hen, asti hi ekam. Now, an eternal and identical which all things are, is precisely what we mean by Being; it is precisely what is denied by those who see only Becoming. The Nihilistic Buddhists¹ insisted that there were only so many ideas, vijñānāni, and impermanent forms which were but the combination of parts and elements: no oneness, no identity anywhere; get beyond ideas and forms, you get to self-extinction, to the Void, to Nothing. Yet one must posit a principle of unity somewhere, if not at the base or in the secret being of things, yet in their action. The Buddhists had

¹ Buddha himself remained silent on this question; his goal of Nirvana was a negation of phenomenal existence, but not necessarily a denial of any kind of existence.
to posit their universal principle of Karma which, when you think of it, comes after all to a universal energy as the cause of the world, a creator and preserver of unchanging measures. Nietzsche denied Being, but had to speak of a universal Will-to-be; which again, when you come to think of it, seems to be no more than a translation of the Upanishadic *tapo brahma*, “Will-Energy is Brahman.” The later Sankhya denied the unity of conscious existences, but asserted the unity of Nature, Prakriti, which is again at once the original principle and substance of things and the creative energy, the *phusis* of the Greeks. It is indeed wise to agree that all things are one; for vision drives at that, the soul and the heart reach out to that, thought comes circling round to it in the very act of denial.

Heraclitus saw what all must see who look at the world with any attention, that there is something in all this motion and change and differentiation which insists on stability, which goes back to sameness, which assures unity, which triumphs into eternity. It has always the same measures; it is, was and ever will be. We are the same in spite of all our differences; we start from the same origin, proceed by the same universal laws, live, differ and strive in the bosom of an eternal oneness, are seeking always for that which binds all beings together and makes all things one. Each sees it in his own way, lays stress on this or that aspect of it, loses sight of or diminishes other aspects, gives it therefore a different name — even as Heraclitus, attracted by its aspect of creative and destructive Force, gave it the name of Fire. But when he generalises, he puts it widely enough; it is the One that is All, it is the All that is One, — Zeus, eternity, the Fire. He could have said with the Upanishad, “All this is the Brahman”, *sarvam khalu idam brahma*, though he could not have gone on and said, “This Self is the Brahman”, but would have declared rather of Agni what a Vedantic formula says of Vayu, *tvam pratyakṣam brahmāsi*, “Thou art manifest Brahman.”

But we may admit the One in different ways. The Adwaitins affirmed the One, the Being, but put away “all things” as Maya, or they recognised the immanence of the Being in these becomings which are yet not-Self, not That. Vaishnava philosophy saw
existence as eternally one in the Being, God, eternally many by His nature or conscious-energy in the souls whom He becomes or who exist in her. In Greece also Anaximander denied the multiple reality of the Becoming. Empedocles affirmed that the All is eternally one and many; all is one which becomes many and then again goes back to oneness. But Heraclitus will not so cut the knot of the riddle. “No,” he says in effect, “I hold to my idea of the eternal oneness of all things; never do they cease to be one. It is all my everliving Fire that takes various shapes and names, changes itself into all that is and yet remains itself, not at all by any illusion or mere appearance of becoming, but with a severe and positive reality.” All things then are in their reality and substance and law and reason of their being the One; the One in its shapes, values, changings becomes really all things. It changes and is yet immutable: for it does not increase or diminish, nor does it lose for a moment its eternal nature and identity which is that of the everliving Fire. Many values which reduce themselves to the same standard and judge of all values; many forces which go back to the same unalterable energy; many becomings which both represent and amount to one identical Being.

Here Heraclitus brings in his formula of “One out of all and all out of One”, which is his account of the process of the cosmos just as his formula “All things are one” is his account of the eternal truth of the cosmos. One, he says, in the process of the cosmos is always becoming all things from moment to moment, hence the eternal flux of things; but all things also are eternally going back to their principle of oneness; hence the unity of the cosmos, the sameness behind the flux of becoming, the stability of measures, the conservation of energy in all changes. This he explains farther by his theory of change as in its character a constant exchange. But is there then no end to this simultaneous upward and downward motion of things? As the downward has so far prevailed as to create the cosmos, will not the upward too prevail so as to dissolve it back into the everliving Fire? Here we come to the question whether Heraclitus did or did not hold the theory of a periodic conflagration or pralaya. “Fire will come on all things and judge and convict them.” If he held it, then we have
again another striking coincidence of Heraclitus’ thought with our familiar Indian notions, the periodic *pralaya*, the Puranic conflagration of the world by the appearance of the twelve suns, the Vedantic theory of the eternal cycles of manifestation and withdrawal from manifestation. In fact, both the lines of thought are essentially the same and had to arrive inevitably at the same conclusions.
Heraclitus—4

HERACLITUS’ account of the cosmos is an evolution and involution out of his one eternal principle of Fire, — at once the one substance and the one force, — which he expresses in his figurative language as the upward and downward road. “The road up and down” he says “is one and the same.” Out of Fire, the radiant and energetic principle, air, water and earth proceed, — that is the procession of energy on its downward road; there is equally in the very tension of this process a force of potential return which would lead things backward to their source in the reverse order. In the balance of these two upward and downward forces resides the whole cosmic action; everything is a poise of contrary energies. The movement of life is like the back-returning of the bow, to which he compares it, an energy of traction and tension restraining an energy of release, every force of action compensated by a corresponding force of reaction. By the resistance of one to the other all the harmonies of existence are created.

We have the same idea of an evolution of successive conditions of energy out of a primal substance-force in the Indian theory of Sankhya. There indeed the system proposed is more complete and satisfying. It starts with the original or root energy, mūla prakṛti, which as the first substance, pradhāna, evolves by development and change into five successive principles. Ether, not fire, is the first principle, ignored by the Greeks, but rediscovered by modern Science;¹ there follow air, fire, the igneous, radiant and electric energy, water, earth, the fluid and solid. The Sankhya, like Anaximenes, puts Air first of the four principles admitted by the Greeks, though it does not like him make it the original substance, and it thus differs from the order of

¹ Now again rejected, though that does not seem to be indubitable or final.
Heraclitus. But it gives to the principle of fire the function of creating all forms, — as Agni in the Veda is the great builder of the worlds, — and here at least it meets his thought; for it is as the energetic principle behind all formation and mutation that Heraclitus must have chosen Fire as his symbol and material representative of the One. We may remember in this connection how far modern Science has gone to justify these old thinkers by the importance it gives to electricity and radio-active forces — Heraclitus’ fire and thunderbolt, the Indian triple Agni — in the formation of atoms and in the transmutation of energy.

But the Greeks failed to go forward to that final discrimination which India attributed to Kapila, the supreme analytical thinker, — the discrimination between Prakriti and her cosmic principles, her twenty-four tattwas forming the subjective and objective aspects of Nature, and between Prakriti and Purusha, Conscious-Soul and Nature-Energy. Therefore while in the Sankhya ether, fire and the rest are only principles of the objective evolution of Prakriti, evolutionary aspects of the original phusis, the early Greeks could not get back beyond these aspects of Nature to the idea of a pure energy, nor could they at all account for her subjective side. The Fire of Heraclitus has to do duty at once for the original substance of all Matter and for God and Eternity. This preoccupation with Nature-Energy and the failure to fathom its relations with Soul has persisted in modern scientific thought, and we find there too the same attempt to identify some primary principle of Nature, ether or electricity, with the original Force.

However that may be, the theory of the creation of the world by some kind of evolutionary change out of the original substance or energy, by parināma, is common to the early Greek and the Indian systems, however they may differ about the nature of the original phusis. The distinction of Heraclitus among the early Greek sages is his conception of the upward and downward road, one and the same in the descent and the return. It corresponds to the Indian idea of nivṛtti and pravṛtti, the double movement of the Soul and Nature, — pravṛtti, the moving out and forward, nivṛtti, the moving back and in. The
Indian thinkers were preoccupied with this double principle so far as it touches the action of the individual soul entering into the procession of Nature and drawing back from it; but still they saw a similar, a periodic movement forward and back of Nature itself which leads to an ever-repeated cycle of creation and dissolution; they held the idea of a periodic *pralaya*. Heraclitus’ theory would seem to demand a similar conclusion. Otherwise we must suppose that the downward tendency, once in action, has always the upper hand over the upward or that cosmos is eternally proceeding out of the original substance and eternally returning to it, but never actually returns. The Many are then eternal not only in power of manifestation, but in actual fact of manifestation.

It is possible that Heraclitus may so have thought, but it is not the logical conclusion of his theory; it contradicts the evident suggestion of his metaphor about the road which implies a starting-point and a point of return; and we have too the distinct statement of the Stoics that he believed in the theory of conflagration, — an assertion which they are hardly likely to have made if this were not generally accepted as his teaching. The modern arguments against enumerated by Mr. Ranade are founded upon misconceptions. Heraclitus’ affirmation is not simply that the One is always Many, the Many always One, but in his own words, “out of all the One and out of One all.” Plato’s phrasing of the thought, “the reality is both many and one and in its division it is always being brought together,” states the same idea in different language. It means a constant current and back-current of change, the upward and downward road, and we may suppose that as the One by downward change becomes completely the All in the descending process, yet remains eternally the one everliving Fire, so the All by upward change may resort completely to the One and yet essentially exist, since it can again return into various being by the repetition of the downward movement. All difficulty disappears if we remember that what is implied is a process of evolution and involution, — so too the Indian word for creation, *srṣṭi*, means a release or bringing forth of what is held in, latent, — and that the conflagration destroys
existing forms, but not the principle of multiplicity. There will be then no inconsistency at all in Heraclitus’ theory of a periodic conflagration; it is rather, that being the highest expression of change, the complete logic of his system.
If it is the law of change that determines the evolution and involution of the one downward and upward road, the same law prevails all along the path, through all its steps and returns, in all the million transactions of the wayside. There is everywhere the law of exchange and interchange, amoibē. The unity and the multiplicity have at every moment this active relation to each other. The One is constantly exchanging itself for the many; that gold has been given, you have instead these commodities, but in fact they are only so much value of the gold. The many are constantly exchanging themselves for the One; these commodities are given, disappear, are destroyed, we say, but in their place there is the gold, the original substance-energy to the value of the commodities. You see the sun and you think it is the same sun always, but really it is a new sun that rises each day; for it is the Fire’s constant giving of itself in exchange for the elemental commodities that compose the sun which preserves its form, its energy, its movement, all its measures. Science shows us that this is true of all things, of the human body, for instance; it is always the same, but it preserves its apparent identity only by a constant change. There is a constant destruction, yet there is no destruction. Energy distributes itself, but never really dissipates itself; change and unalterable conservation of energy in the change are the law, not destruction. If this world of multiplicity is destroyed in the end by Fire, yet there is no end and it is not destroyed, but only exchanged for the Fire. Moreover, there is exchange between all these becomings which are only so many active values of the Being, commodities that are a fixed value and measure of the universal gold. Fire takes of its substance from one form and gives to another, changes one apparent value of its substance into another apparent value, but the substance-energy remains the

Heraclitus – 5
same and the new value is the equivalent of the old, — as when it turns fuel into smoke and cinders and ashes. Modern Science with a more accurate knowledge of what actually happens in this change, yet confirms Heraclitus’ conclusion. It is the law of the conservation of energy.

Practically, the active secret of life is there; all life physical or mental or merely dynamic maintains itself by constant change and interchange. Still, Heraclitus’ account is so far not altogether satisfactory. The measure, the value of the energy exchanged remains unaltered even when the form is altered, but why should also the cosmic commodities we have for the universal gold be fixed and in a way unchanging? What is the explanation, how comes about this eternity of principles and elements and kinds of combination and this persistence and recurrence of the same forms which we observe in the cosmos? Why in this constant cosmic flux should everything after all remain the same? Why should the sun, though always new, be yet for all practical purposes the same sun? Why should the stream be, as Heraclitus himself admits, the same stream although it is ever other and other waters that are flowing? It was in this connection that Plato brought in his eternal, ideal plane of fixed ideas, by which he seems to have meant at once an originating real-idea and an original ideal schema for all things. An idealistic philosophy of the Indian type might say that this force, the Shakti which you call Fire, is a consciousness which preserves by its energy its original scheme of ideas and corresponding forms of things. But Heraclitus gives us another account, not quite satisfactory, yet profound and full of suggestive truth; it is contained in his striking phrases about war and justice and tension and the Furies pursuing the transgressor of measures. He is the first thinker to see the world entirely in the terms of Power.

What is the nature of this exchange? It is strife, eris, it is war, polemos! What is the rule and result of the war? It is justice. How acts that justice? By a just tension and compensation of forces which produce the harmony of things and therefore, we presume, their stability. “War is the father of all and the king of all”; “All things becoming according to strife”; “To know that
strife is justice”; these are his master apophthegms in this matter. At first we do not see why exchange should be strife; it would seem rather to be commerce. Strife there is, but why should there not also be peaceful and willing interchange? Heraclitus will have none of it; no peace! he would agree with the modern Teuton that commerce itself is a department of War. It is true there is a commerce, gold for commodities, commodities for gold, but the commerce itself and all its circumstances are governed by a forceful, more, a violent compulsion of the universal Fire. That is what he means by the Furies pursuing the sun; “for fear of Him” says the Upanishad “the wind blows . . . and death runs.” And between all beings there is a constant trial of strength; by that warfare they come into being, by that their measures are maintained. We see that he is right; he has caught the initial aspect of cosmic Nature. Everything here is a clash of forces and by that clash and struggle and clinging and wrestling things not only come into being, but are maintained in being. Karma? Laws? But different laws meet and compete and by their tension the balance of the world is maintained. Karma? It is the forcible justice of an eternal compelling Power and it is the Furies pursuing us if we transgress our measures.

War, contends Heraclitus, is not mere injustice, chaotic violence; it is justice, although a violent justice, the only kind possible. Again, from that point of view, we see that he is right. By the energy expended and its value shall the fruits be determined, and where two forces meet, expenditure of energy means a trial of strength. Shall not then the rewards be to the strong according to his strength and to the weak according to his weakness? So it is at least in the world, the primal law, although subject to the help of the weak by the strong which need not after all be an injustice or a violation of measures, in spite of Nietzsche and Heraclitus. And is there not after all sometimes a tremendous strength behind weakness, the very strength of the pressure on the oppressed which brings its terrible reaction, the back return of the bow, Zeus, the eternal Fire, observing his measures?

Not only between being and being, force and force is there
war, but within each there is an eternal opposition, a tension of contraries, and it is this tension which creates the balance necessary to harmony. Harmony then there is, for cosmos itself is in its result a harmony; but it is so because in its process it is war, tension, opposition, a balance of eternal contraries. Real peace there cannot be, unless by peace you mean a stable tension, a balance of power between hostile forces, a sort of mutual neutralisation of excesses. Peace cannot create, cannot maintain anything, and Homer’s prayer that war might perish from among Gods and men is a monstrous absurdity, for that would mean the end of the world. A periodic end there may be, not by peace or reconciliation, but by conflagration, by an attack of Fire, to pur epelthon, a fiery judgment and conviction. Force created the world, Force is the world, Force by its violence maintains the world, Force shall end the world, — and eternally re-create it.
Heraclitus – 6

HERACLITUS is the first and the most consistent teacher of the law of relativity; it is the logical result of his primary philosophical concepts. Since all is one in its being and many in its becoming, it follows that everything must be one in its essence. Night and day, life and death, good and evil can only be different aspects of the same absolute reality. Life and death are in fact one, and we may say from different points of view that all death is only a process and change of life or that all life is only an activity of death. Really both are one energy whose activity presents to us a duality of aspects. From one point of view we are not, for our existence is only a constant mutation of energy; from another we are, because the being in us is always the same and sustains our secret identity. So too, we can only speak of a thing as good or evil, just or unjust, beautiful or ugly from a purely relative point of view, because we adopt a particular standpoint or have in view some practical end or temporarily valid relation. He gives the example of “the sea, water purest and impurest”, their fine element to the fish, abominable and undrinkable to man. And does not this apply to all things? — they are the same always in reality and assume their qualities and properties because of our standpoint in the universe of becoming, the nature of our seeing and the texture of our minds. All things circle back to the eternal unity and in their beginning and end are the same; it is only in the arc of becoming that they vary in themselves and from each other, and there they have no absoluteness to each other. Night and day are the same; it is only the nature of our vision and our standing-point on the earth and our relations of earth and sun that create the difference. What is day to us, is to others night.

Because of this insistence on the relativity of good and evil,
Heraclitus is thought to have enunciated some kind of supermoralism; but it is well to see carefully to what this supermoralism of Heraclitus really amounts. Heraclitus does not deny the existence of an absolute; but for him the absolute is to be found in the One, in the Divine, — not the gods, but the one supreme Divinity, the Fire. It has been objected that he attributes relativity to God, because he says that the first principle is willing and yet not willing to be called by the name of Zeus. But surely this is to misunderstand him altogether. The name Zeus expresses only the relative human idea of the Godhead; therefore while God accepts the name, He is not bound or limited by it. All our concepts of Him are partial and relative; “He is named according to the pleasure of each.” This is nothing more nor less than the truth proclaimed by the Vedas, “One existent the sages call by many names.” Brahman is willing to be called Vishnu, and yet he is not willing, because he is also Brahma and Maheshwara and all the gods and the world and all principles and all that is, and yet not any of these things, neti neti. As men approach him, so he accepts them. But the One to Heraclitus as to the Vedantin is absolute.

This is quite clear from all his sayings; day and night, good and evil are one, because they are the One in their essence and in the One the distinctions we make between them disappear. There is a Word, a Reason in all things, a Logos, and that Reason is one; only men by the relativeness of their mentality turn it each into his personal thought and way of looking at things and live according to this variable relativity. It follows that there is an absolute, a divine way of looking at things. “To God all things are good and just, but men hold some things to be good, others unjust.” There is then an absolute good, an absolute beauty, an absolute justice of which all things are the relative expression. There is a divine order in the world; each thing fulfills its nature according to its place in the order and in its place and symmetry in the one Reason of things is good, just and beautiful precisely because it fulfills that Reason according to the eternal measures. To take an example, the world war may be regarded as an evil by some, a sheer horror of carnage, to others because of the new
possibilities it opens to mankind, it may seem a good. It is at once good and evil. But that is the relative view; in its entirety, in its fulfilment in each and all of its circumstances of a divine purpose, a divine justice, a divine force executing itself in the large reason of things, it is from the absolute point of view good and just — to God, not to man.

Does it follow that the relative view-point has no validity at all? Not for a moment. On the contrary, it must be the expression, proper to each mentality according to the necessity of its nature and standpoint, of the divine Law. Heraclitus says that plainly; “Fed are all human laws by one, the divine.” That sentence ought to be quite sufficient to protect Heraclitus against the charge of antinomianism. True, no human law is the absolute expression of the divine justice, but it draws its validity, its sanction from that and is valid for its purpose, in its place, in its proper time, has its relative necessity. Even though men’s notions of good and justice vary in the mutations of the becoming, yet human good and justice persist in the stream of things, preserve a measure. Heraclitus admits relative standards, but as a thinker he is obliged to go beyond them. All is at once one and many, an absolute and a relative, and all the relations of the many are relativities, yet are fed by, go back to, persist by that in them which is absolute.
THE IDEAS of Heraclitus on which I have so far laid stress, are general, philosophical, metaphysical; they glance at those first truths of existence, \textit{devānāṁ prathamā vratāṁ},\textsuperscript{1} for which philosophy first seeks because they are the key to all other truths. But what is their practical effect on human life and aspiration? For that is in the end the real value of philosophy for man, to give him light on the nature of his being, the principles of his psychology, his relations with the world and with God, the fixed lines or the great possibilities of his destiny. It is the weakness of most European philosophy — not the ancient — that it lives too much in the clouds and seeks after pure metaphysical truth too exclusively for its own sake; therefore it has been a little barren because much too indirect in its bearing on life. It is the great distinction of Nietzsche among later European thinkers to have brought back something of the old dynamism and practical force into philosophy, although in the stress of this tendency he may have neglected unduly the dialectical and metaphysical side of philosophical thinking. No doubt, in seeking Truth we must seek it for its own sake first and not start with any preconceived practical aim and prepossession which would distort our disinterested view of things; but when Truth has been found, its bearing on life becomes of capital importance and is the solid justification of the labour spent in our research. Indian philosophy has always understood its double function; it has sought the Truth not only as an intellectual pleasure or the natural dharma of the reason, but in order to know how man may live by the Truth or strive after it; hence its intimate influence on the religion, the social ideas, the daily life of the people, its immense dynamic

\textsuperscript{1} The first laws of working of the Gods.
power on the mind and actions of Indian humanity. The Greek thinkers, Pythagoras, Socrates, Plato, the Stoics and Epicureans, had also this practical aim and dynamic force, but it acted only on the cultured few. That was because Greek philosophy, losing its ancient affiliation to the Mystics, separated itself from the popular religion; but as ordinarily Philosophy alone can give light to Religion and save it from crudeness, ignorance and superstition, so Religion alone can give, except for a few, spiritual passion and effective power to Philosophy and save it from becoming unsubstantial, abstract and sterile. It is a misfortune for both when the divine sisters part company.

But when we seek among Heraclitus' sayings for the human application of his great fundamental thoughts, we are disappointed. He gives us little direct guidance and on the whole leaves us to draw our own profit from the packed opulence of his first ideas. What may be called his aristocratic view of life, we might regard possibly as a moral result of his philosophical conception of Power as the nature of the original principle. He tells us that the many are bad, the few good and that one is to him equal to thousands, if he be the best. Power of knowledge, power of character,—character, he says, is man's divine force,—power and excellence generally are the things that prevail in human life and are supremely valuable, and these things in their high and pure degree are rare among men, they are the difficult attainment of the few. From that, true enough so far as it goes, we might deduce a social and political philosophy. But the democrat might well answer that if there is an eminent and concentrated virtue, knowledge and force in the one or the few, so too there is a diffused virtue, knowledge and force in the many which acting collectively may outweigh and exceed isolated or rare excellences. If the king, the sage, the best are Vishnu himself, as old Indian thought also affirmed, to a degree to which the ordinary man, prākrto janaḥ, cannot pretend, so also are “the five”, the group, the people. The Divine is samaṣṭi as well as vyāṣṭi, manifested in the collectivity as well as in the individual, and the justice on which Heraclitus insists demands that both should have their effect and their value; they depend
indeed and draw on each other for the effectuation of their excellences.

Other sayings of Heraclitus are interesting enough, as when he affirms the divine element in human laws, — and that is also a profound and fruitful sentence. His views on the popular religion are interesting, but move on the surface and do not carry us very far even on the surface. He rejects with a violent contempt the current degradation of the old mystic formulas and turns from them to the true mysteries, those of Nature and of our being, that Nature which, as he says, loves to be hidden, is full of mysteries, ever occult. It is a sign that the lore of the early Mystics had been lost, the spiritual sense had departed out of their symbols, even as in Vedic India; but there took place in Greece no new and powerful movement which could, as in India, replace them by new symbols, new and more philosophic restatements of their hidden truths, new disciplines, schools of Yoga. Attempts, such as that of Pythagoras, were made; but Greece at large followed the turn given by Heraclitus, developed the cult of the reason and left the remnants of the old occult religion to become a solemn superstition and a conventional pomp.

Doubly interesting is his condemnation of animal sacrifice; it is, he says, a vain attempt at purification by defilement of oneself with blood, as if we were to cleanse mud-stained feet with mud. Here we see the same trend of revolt against an ancient and universal religious practice as that which destroyed in India the sacrificial system of the Vedic religion, — although Buddha's great impulse of compassion was absent from the mind of Heraclitus: pity could never have become a powerful motive among the old Mediterranean races. But the language of Heraclitus shows us that the ancient system of sacrifice in Greece and in India was not a mere barbaric propitiation of savage deities, as modern inquiry has falsely concluded; it had a psychological significance, purification of the soul as well as propitiation of higher and helpful powers, and was therefore in all probability mystic and symbolical; for purification was, as we know, one of the master ideas of the ancient Mysteries. In India of the Gita, in the development of Judaism by the prophets
and by Jesus, while the old physical symbols were discouraged and especially the blood-rite, the psychological idea of sacrifice was saved, emphasised and equipped with subtler symbols, such as the Christian Eucharist and the offerings of the devout in the Shaiva or Vaishnava temples. But Greece with its rational bent and its insufficient religious sense was unable to save its religion; it tended towards that sharp division between philosophy and science on one side and religion on the other which has been so peculiar a characteristic of the European mind. Here too Heraclitus was, as in so many other directions, a forerunner, an indicator of the natural bent of occidental thought.

Equally striking is his condemnation of idol-worship, one of the earliest in human history, — “he who prays to an image is chattering to a stone wall.” The intolerant violence of this protestant rationalism and positivism makes Heraclitus again a precursor of a whole movement of the human mind. It is not indeed a religious protest such as that of Mahomed against the naturalistic, Pagan and idolatrous polytheism of the Arabs or of the Protestants against the aesthetic and emotional saint-worship of the Catholic Church, its Mariolatry and use of images and elaborate ritual; its motive is philosophic, rational, psychological. Heraclitus was not indeed a pure rationalist. He believes in the Gods, but as psychological presences, cosmic powers, and he is too impatient of the grossness of the physical image, its hold on the senses, its obscuration of the psychological significance of the godheads to see that it is not to the stone, but to the divine person figured in the stone that the prayer is offered. It is noticeable that in his conception of the gods he is kin to the old Vedic seers, though not at all a religious mystic in his temperament. The Vedic religion seems to have excluded physical images and it was the protestant movements of Jainism and Buddhism which either introduced or at least popularised and made general the worship of images in India. Here too Heraclitus prepares the way for the destruction of the old religion, the reign of pure philosophy and reason and the void which was filled up by Christianity; for man cannot live by reason alone. When it was too late, some attempt was made to re-spiritualise the
old religion, and there was the remarkable effort of Julian and Libanius to set up a regenerated Paganism against triumphant Christianity; but the attempt was too unsubstantial, too purely philosophic, empty of the dynamic power of the religious spirit. Europe had killed its old creeds beyond revival and had to turn for its religion to Asia.

Thus, for the general life of man Heraclitus has nothing to give us beyond his hint of an aristocratic principle in society and politics, — and we may note that this aristocratic bent was very strong in almost all the subsequent Greek philosophers. In religion his influence tended to the destruction of the old creed without effectively putting anything more profound in its place; though not himself a pure rationalist, he prepared the way for philosophic rationalism. But even without religion philosophy by itself can give us at least some light on the spiritual destiny of man, some hope of the infinite, some ideal perfection after which we can strive. Plato who was influenced by Heraclitus, tried to do this for us; his thought sought after God, tried to seize the ideal, had its hope of a perfect human society. We know how the Neo-platonists developed his ideas under the influence of the East and how they affected Christianity. The Stoics, still more directly the intellectual descendants of Heraclitus, arrived at very remarkable and fruitful ideas of human possibility and a powerful psychological discipline, — as we should say in India, a Yoga, — by which they hoped to realise their ideal. But what has Heraclitus himself to give us? Nothing directly; we have to gather for ourselves whatever we can from his first principles and his cryptic sentences.

Heraclitus was regarded in ancient times as a pessimistic thinker and we have one or two sayings of his from which we can, if we like, deduce the old vain gospel of the vanity of things. Time, he says, is playing draughts like a child, amusing itself with counters, building castles on the sea-shore only to throw them down again. If that is the last word, then all human effort and aspiration are vain. But on what primary philosophical conception does this discouraging sentence depend? Everything turns
on that; for in itself this is no more than an assertion of a self-evident fact, the mutability of things and the recurrent transiency of forms. But if the principles which express themselves in forms are eternal or if there is a Spirit in things which finds its account in the mutations and evolutions of Time and if that Spirit dwells in the human being as the immortal and infinite power of his soul, then no conclusion of the vanity of the world or the vanity of human existence arises. If indeed the original and eternal principle of Fire is a purely physical substance or force, then, truly, since all the great play and effort of consciousness in us must sink and dissolve into that, there can be no permanent spiritual value in our being, much less in our works. But we have seen that Heraclitus’ Fire cannot be a purely physical or inconscient principle. Does he then mean that all our existence is merely a continual changeable Becoming, a play or Lila with no purpose in it except the playing and no end except the conviction of the vanity of all cosmic activity by its relapse into the indistinguishable unity of the original principle or substance? For even if that principle, the One to which the many return, be not merely physical or not really physical at all, but spiritual, we may still, like the Mayavadins, affirm the vanity of the world and of our human existence, precisely because the one is not eternal and the other has no eventual aim except its own self-abolition after the conviction of the vanity and unreality of all its temporal interests and purposes. Is the conviction of the world by the one absolute Fire such a conviction of the vanity of all the temporal and relative values of the Many?

That is one sense in which we can understand the thought of Heraclitus. His idea of all things as born of war and existing by strife might, if it stood by itself, lead us to adopt, even if he himself did not clearly arrive at, that conclusion. For if all is a continual struggle of forces, its best aspect only a violent justice and the highest harmony only a tension of opposites without any hope of a divine reconciliation, its end a conviction and destruction by eternal Fire, all our ideal hopes and aspirations are out of place; they have no foundation in the truth of things. But there is another side to the thought
of Heraclitus. He says indeed that all things come into being “according to strife”, by the clash of forces, are governed by the determining justice of war. He says farther that all is utterly determined, fated. But what then determines? The justice of a clash of forces is not fate; forces in conflict determine indeed, but from moment to moment, according to a constantly changing balance always modifiable by the arising of new forces. If there is predetermination, an inevitable fate in things, then there must be some power behind the conflict which determines them, fixes their measures. What is that power? Heraclitus tells us; all indeed comes into being according to strife, but also all things come into being according to Reason, *kat’ erin* but also *kata ton logon*. What is this Logos? It is not an inconscient reason in things, for his Fire is not merely an inconscient force, it is Zeus and eternity. Fire, Zeus is Force, but it is also an Intelligence; let us say then that it is an intelligent Force which is the origin and master of things. Nor can this Logos be identical in its nature with the human reason; for that is an individual and therefore relative and partial judgment and intelligence which can only seize on relative truth, not on the true truth of things, but the Logos is one and universal, an absolute reason therefore combining and managing all the relativities of the many. Was not then Philo justified in deducing from this idea of an intelligent Force originating and governing the world, Zeus and Fire, his interpretation of the Logos as “the divine dynamic, the energy and the self-revelation of God”? Heraclitus might not so have phrased it, might not have seen all that his thought contained, but it does contain this sense when his different sayings are fathomed and put together in their consequences.

We get very near the Indian conception of Brahman, the cause, origin and substance of all things, an absolute Existence whose nature is consciousness (Chit) manifesting itself as Force (Tapas, Shakti) and moving in the world of his own being as the Seer and Thinker, *kavir maniṣi*, an immanent Knowledge-Will in all, *vijñānamaya puruṣa*, who is the Lord or Godhead, *iś, iśvara, deva*, and has ordained all things according to their
nature from years sempiternal, — Heraclitus’ “measures” which the Sun is forced to observe, his “things are utterly determined.” This Knowledge-Will is the Logos. The Stoics spoke of it as a seed Logos, spermatikos, reproduced in conscious beings as a number of seed Logoi; and this at once reminds us of the Vedantic prājñā puruṣa, the supreme Intelligence who is the Lord and dwells in the sleep-state holding all things in a seed of dense consciousness which works out through the perceptions of the subtle Purusha, the mental Being. Vijnana is indeed a consciousness which sees things, not as the human reason sees them in parts and pieces, in separated and aggregated relations, but in the original reason of their existence and law of their existence, their primal and total truth; therefore it is the seed Logos, the originative and determinant conscious force working as supreme Intelligence and Will. The Vedic seers called it the Truth-consciousness and believed that men also could become truth-conscious, enter into the divine Reason and Will and by the Truth become immortals, anthrôpoi athanatoi.

Does the thought of Heraclitus admit of any such hope as the Vedic seers held and hymned with so triumphant a confidence? or does it even give ground for any aspiration to some kind of a divine supermanhood such as his disciples the Stoics so sternly laboured for or as that of which Nietzsche, the modern Heraclitus, drew a too crude and violent figure? His saying that man is kindled and extinguished as light disappears into night, is commonplace and discouraging enough. But this may after all be only true of the apparent man. Is it possible for man in his becoming to raise his present fixed measures? to elevate his mental, relative, individual reason into direct communion with or direct participation in the divine and absolute reason? to inspire and raise the values of his human force to the higher values of the divine force? to become aware like the gods of an absolute good and an absolute beauty? to lift this mortal to the nature of immortality? Against his melancholy image of human transiency we have that remarkable and cryptic sentence, “the gods are mortals, men immortals”, which, taken literally, might mean that the gods are powers that perish and
replace each other and the soul of man alone is immortal, but must at least mean that there is in man behind his outward transiency an immortal spirit. We have too his saying, “thou canst not find the limits of the soul”, and we have the profoundest of all Heraclitus’ utterances, “the kingdom is of the child.” If man is in his real being an infinite and immortal spirit, there is surely no reason why he should not awaken to his immortality, arise towards the consciousness of the universal, one and absolute, live in a higher self-realisation. “I have sought for myself” says Heraclitus; and what was it that he found?

But there is one great gap and defect whether in his knowledge of things or his knowledge of the self of man. We see in how many directions the deep divining eye of Heraclitus anticipated the largest and profoundest generalisations of Science and Philosophy and how even his more superficial thoughts indicate later powerful tendencies of the occidental mind, how too some of his ideas influenced such profound and fruitful thinkers as Plato, the Stoics, the Neo-platonists. But in his defect also he is a forerunner; it illustrates the great deficiency of later European thought, such of it at least as has not been profoundly influenced by Asiatic religions or Asiatic mysticism. I have tried to show how often his thought touches and is almost identical with the Vedic and Vedantic. But his knowledge of the truth of things stopped with the vision of the universal reason and the universal force; he seems to have summed up the principle of things in these two first terms, the aspect of consciousness, the aspect of power, a supreme intelligence and a supreme energy. The eye of Indian thought saw a third aspect of the Self and of Brahman; besides the universal consciousness active in divine knowledge, besides the universal force active in divine will, it saw the universal delight active in divine love and joy. European thought, following the line of Heraclitus’ thinking, has fixed itself on reason and on force and made them the principles towards whose perfection our being has to aspire. Force is the first aspect of the world, war, the clash of energies; the second aspect, reason, emerges out of the appearance of
force in which it is at first hidden and reveals itself as a certain justice, a certain harmony, a certain determining intelligence and reason in things; the third aspect is a deeper secret behind these two, universal delight, love, beauty which taking up the other two can establish something higher than justice, better than harmony, truer than reason,—unity and bliss, the ecstasy of our fulfilled existence. Of this last secret power Western thought has only seen two lower aspects, pleasure and aesthetic beauty; it has missed the spiritual beauty and the spiritual delight. For that reason Europe has never been able to develop a powerful religion of its own; it has been obliged to turn to Asia. Science takes possession of the measures and utilities of Force; rational philosophy pursues reason to its last subtleties; but inspired philosophy and religion can seize hold of the highest secret, uttamaṁ rahasyam.

Heraclitus might have seen it if he had carried his vision a little farther. Force by itself can only produce a balance of forces, the strife that is justice; in that strife there takes place a constant exchange and, once this need of exchange is seen, there arises the possibility of modifying and replacing war by reason as the determinant principle of the exchange. This is the second effort of man, of which Heraclitus did not clearly see the possibility. From exchange we can rise to the highest possible idea of interchange, a mutual dependency of self-giving as the hidden secret of life; from that can grow the power of Love replacing strife and exceeding the cold balance of reason. There is the gate of the divine ecstasy. Heraclitus could not see it, and yet his one saying about the kingdom of the child touches, almost reaches the heart of the secret. For this kingdom is evidently spiritual, it is the crown, the mastery to which the perfected man arrives; and the perfect man is a divine child! He is the soul which awakens to the divine play, accepts it without fear or reserve, gives itself up in a spiritual purity to the Divine, allows the careful and troubled force of man to be freed from care and grief and become the joyous play of the divine Will, his relative and stumbling reason to be replaced by that divine knowledge which to the Greek, the
rational man, is foolishness, and the laborious pleasure-seeking of the bound mentality to lose itself in the spontaneity of the divine Ananda; “for of such is the kingdom of heaven.” The Paramhansa, the liberated man, is in his soul bālavat, even as if a child.
The Problem of Rebirth
Section I
Rebirth and Karma
Rebirth

The theory of rebirth is almost as ancient as thought itself and its origin is unknown. We may according to our prepossessions accept it as the fruit of ancient psychological experience always renewable and verifiable and therefore true or dismiss it as a philosophical dogma and ingenious speculation; but in either case the doctrine, even as it is in all appearance well-nigh as old as human thought itself, is likely also to endure as long as human beings continue to think.

In former times the doctrine used to pass in Europe under the grotesque name of transmigration which brought with it to the Western mind the humorous image of the soul of Pythagoras migrating, a haphazard bird of passage, from the human form divine into the body of a guinea-pig or an ass. The philosophical appreciation of the theory expressed itself in the admirable but rather unmanageable Greek word, metempsychosis, which means the insouling of a new body by the same psychic individual. The Greek tongue is always happy in its marriage of thought and word and a better expression could not be found; but forced into English speech the word becomes merely long and pedantic without any memory of its subtle Greek sense and has to be abandoned. Reincarnation is the now popular term, but the idea in the word leans to the gross or external view of the fact and begs many questions. I prefer “rebirth”, for it renders the sense of the wide, colourless, but sufficient Sanskrit term, punarjanma, “again-birth”, and commits us to nothing but the fundamental idea which is the essence and life of the doctrine.

Rebirth is for the modern mind no more than a speculation and a theory; it has never been proved by the methods of modern science or to the satisfaction of the new critical mind formed by a scientific culture. Neither has it been disproved; for modern science knows nothing about a before-life or an after-life for
the human soul, knows nothing indeed about a soul at all, nor can know; its province stops with the flesh and brain and nerve, the embryo and its formation and development. Neither has modern criticism any apparatus by which the truth or untruth of rebirth can be established. In fact, modern criticism, with all its pretensions to searching investigation and scrupulous certainty, is no very efficient truth-finder. Outside the sphere of the immediate physical it is almost helpless. It is good at discovering data, but except where the data themselves bear on the surface their own conclusion, it has no means of being rightly sure of the generalisations it announces from them so confidently in one generation and destroys in the next. It has no means of finding out with surety the truth or untruth of a doubtful historical assertion; after a century of dispute it has not even been able to tell us yes or no, whether Jesus Christ ever existed. How then shall it deal with such a matter as this of rebirth which is stuff of psychology and must be settled rather by psychological than physical evidence?

The arguments which are usually put forward by supporters and opponents, are often weak or futile and even at their best insufficient either to prove or to disprove anything in the world. One argument, for instance, often put forward triumphantly in disproof is this that we have no memory of our past lives and therefore there were no past lives! One smiles to see such reasoning seriously used by those who imagine that they are something more than intellectual children. The argument proceeds on psychological grounds and yet it ignores the very nature of our ordinary or physical memory which is all that the normal man can employ. How much do we remember of our actual lives which we are undoubtedly living at the present moment? Our memory is normally good for what is near, becomes vaguer or less comprehensive as its objects recede into the distance, farther off seizes only some salient points and, finally, for the beginning of our lives falls into a mere blankness. Do we remember even the mere fact, the simple state of being an infant on the mother’s breast? and yet that state of infancy was, on any but a Buddhist theory, part of the same life and belonged to the same
individual,—the very one who cannot remember it just as he cannot remember his past lives. Yet we demand that this physical memory, this memory of the brute brain of man which cannot remember our infancy and has lost so much of our later years, shall recall that which was before infancy, before birth, before itself was formed. And if it cannot, we are to cry, “Disproved your reincarnation theory!” The sapient insipience of our ordinary human reasoning could go no farther than in this sort of ratiocination. Obviously, if our past lives are to be remembered whether as fact and state or in their events and images, it can only be by a psychical memory awaking which will overcome the limits of the physical and resuscitate impressions other than those stamped on the physical being by physical cerebration.

I doubt whether, even if we could have evidence of the physical memory of past lives or of such a psychical awakening, the theory would be considered any better proved than before. We now hear of many such instances confidently alleged though without that apparatus of verified evidence responsibly examined which gives weight to the results of psychical research. The sceptic can always challenge them as mere fiction and imagination unless and until they are placed on a firm basis of evidence. Even if the facts alleged are verified, he has the resource of affirming that they are not really memories but were known to the person alleging them by ordinary physical means or were suggested to him by others and have been converted into reincarnate memory either by conscious deception or by a process of self-deception and self-hallucination. And even supposing the evidence were too strong and unexceptionable to be got rid of by these familiar devices, they might yet not be accepted as proof of rebirth; the mind can discover a hundred theoretical explanations for a single group of facts. Modern speculation and research have brought in this doubt to overhang all psychical theory and generalisation.

We know for instance that in the phenomena, say, of automatic writing or of communication from the dead, it is disputed whether the phenomena proceed from outside, from disembodied minds, or from within, from the subliminal consciousness,
or whether the communication is actual and immediate from the released personality or is the uprising to the surface of a telepathic impression which came from the mind of the then living man but has remained submerged in our subliminal mentality. The same kind of doubts might be opposed to the evidences of reincarnate memory. It might be maintained that they prove the power of a certain mysterious faculty in us, a consciousness that can have some inexplicable knowledge of past events, but that these events may belong to other personalities than ours and that our attribution of them to our own personality in past lives is an imagination, a hallucination, or else an instance of that self-appropriation of things and experiences perceived but not our own which is one out of the undoubted phenomena of mental error. Much would be proved by an accumulation of such evidences but not, to the sceptic at least, rebirth. Certainly, if they were sufficiently ample, exact, profuse, intimate, they would create an atmosphere which would lead in the end to a general acceptance of the theory by the human race as a moral certitude. But proof is a different matter.

After all, most of the things that we accept as truths are really no more than moral certitudes. We have all the profoundest unshakable faith that the earth revolves on its own axis, but as has been pointed out by a great French mathematician, the fact has never been proved; it is only a theory which accounts well for certain observable facts, no more. Who knows whether it may not be replaced in this or another century by a better—or a worse? All observed astronomical phenomena were admirably accounted for by theories of spheres and I know not what else, before Galileo came in with his “And yet it moves,” disturbing the infallibility of Popes and Bibles and the science and logic of the learned. One feels certain that admirable theories could be invented to account for the facts of gravitation if our intellects were not prejudiced and prepossessed by the anterior demonstrations of Newton.¹ This is the ever-perplexing and inherent plague of our reason; for it starts by knowing nothing and has

¹ This was written in pre-Einsteinian days.
to deal with infinite possibilities, and the possible explanations of any given set of facts, until we actually know what is behind them, are endless. In the end, we really know only what we observe and even that subject to a haunting question, for instance, that green is green and white is white, although it appears that colour is not colour but something else that creates the appearance of colour. Beyond observable fact we must be content with reasonable logical satisfaction, dominating probability and moral certitude, — at least until we have the sense to observe that there are faculties in us higher than the sense-dependent reason and awaiting development by which we can arrive at greater certainties.

We cannot really assert as against the sceptic any such dominant probability or any such certitude on behalf of the theory of rebirth. The external evidence yet available is in the last degree rudimentary. Pythagoras was one of the greatest of sages, but his assertion that he fought at Troy under the name of the Antenorid and was slain by the younger son of Atreus is an assertion only and his identification of the Trojan shield will convince no one who is not already convinced; the modern evidence is not as yet any more convincing than the proof of Pythagoras. In absence of external proof which to our matter-governed sensational intellects is alone conclusive, we have the argument of the reincarnationists that their theory accounts for all the facts better than any other yet advanced. The claim is just, but it does not create any kind of certitude. The theory of rebirth coupled with that of Karma gives us a simple, symmetrical, beautiful explanation of things; but so too the theory of the spheres gave us once a simple, symmetrical, beautiful explanation of the heavenly movements. Yet we have now got quite another explanation, much more complex, much more Gothic and shaky in its symmetry, an inexplicable order evolved out of chaotic infinities, which we accept\(^2\) as the truth of the

\(^2\) Or used to accept, but now it is suggested that this order is only a schema created by our own mind or determined by the constitution of our brain, a syntax and logic of word and thought which we impose on a world that in fact does not or may not contain any such thing.
matter. And yet, if we will only think, we shall perhaps see that even this is not the whole truth; there is much more behind we have not yet discovered. Therefore the simplicity, symmetry, beauty, satisfactoriness of the reincarnation theory is no warrant of its certitude.

When we go into details, the uncertainty increases. Rebirth accounts, for example, for the phenomenon of genius, inborn faculty and so many other psychological mysteries. But then Science comes in with its all-sufficient explanation by heredity, — though, like that of rebirth, all-sufficient only to those who already believe in it. Without doubt, the claims of heredity have been absurdly exaggerated. It has succeeded in accounting for much, not all, in our physical make-up, our temperament, our vital peculiarities. Its attempt to account for genius, inborn faculty and other psychological phenomena of a higher kind is a pretentious failure. But this may be because Science knows nothing at all that is fundamental about our psychology, — no more than primitive astronomers knew of the constitution and law of the stars whose movements they yet observed with a sufficient accuracy. I do not think that even when Science knows more and better, it will be able to explain these things by heredity; but the scientist may well argue that he is only at the beginning of his researches, that the generalisation which has explained so much may well explain all, and that at any rate his hypothesis has had a better start in its equipment of provable facts than the theory of reincarnation.

Nevertheless, the argument of the reincarnationist is so far a good argument and respect-worthy, though not conclusive. But there is another more clamorously advanced which seems to me to be on a par with the hostile reasoning from absence of memory, at least in the form in which it is usually advanced to attract unripe minds. This is the ethical argument by which it is sought to justify God’s ways with the world or the world’s ways with itself. There must, it is thought, be a moral governance for the world; or at least some sanction of reward in the cosmos for virtue, some sanction of punishment for sin. But upon our perplexed and chaotic earth no such sanction appears. We see the
good man thrust down into the press of miseries and the wicked
flourishing like a green bay-tree and not cut down miserably in
his end. Now this is intolerable. It is a cruel anomaly, it is a
reflection on God's wisdom and justice, almost a proof that God
is not; we must remedy that. Or if God is not, we must have
some other sanction for righteousness.

How comforting it would be if we could tell a good man and
even the amount of his goodness, — for should not the Supreme
be a strict and honourable accountant? — by the amount of ghee
that he is allowed to put into his stomach and the number of
rupees he can jingle into his bank and the various kinds of good
luck that accrue to him. Yes, and how comforting too if we could
point our finger at the wicked stripped of all concealment and cry
at him, "O thou wicked one! for if thou wert not evil, wouldst
thou in a world governed by God or at least by good, be thus
ragged, hungry, unfortunate, pursued by griefs, void of honour
among men? Yes, thou art proved wicked, because thou art
ragged. God's justice is established." The Supreme Intelligence
being fortunately wiser and nobler than man's childishness, this
is impossible. But let us take comfort! It appears that if the
good man has not enough good luck and ghee and rupees, it is
because he is really a scoundrel suffering for his crimes,— but
a scoundrel in his past life who has suddenly turned a new leaf
in his mother's womb; and if yonder wicked man flourishes and
tramples gloriously on the world, it is because of his goodness —
in a past life, the saint that was then having since been converted
— was it by his experience of the temporal vanity of virtue? — to
the cult of sin. All is explained, all is justified. We suffer for our
sins in another body; we shall be rewarded in another body for
our virtues in this; and so it will go on ad infinitum. No wonder,
the philosophers found this a bad business and proposed as a
remedy to get rid of both sin and virtue and even as our highest
good to scramble anyhow out of a world so amazingly governed.

Obviously, this scheme of things is only a variation of the
old spiritual-material bribe and menace, the bribe of a Heaven
of fat joys for the good and the threat of a hell of eternal fire
or bestial tortures for the wicked. The idea of the Law of the
world as primarily a dispenser of rewards and punishments is
cognate to the idea of the Supreme Being as a judge, “father” and
school-master who is continually rewarding with lollipops his
good boys and continually caning his naughty urchins. It is cog-
nate also to the barbarous and unthinking system of sometimes
savage and always degrading punishment for social offences
on which human society, unable still to find out or organise a
more satisfactory way, is still founded. Man insists continually
on making God in his own image instead of seeking to make
himself more and more in the image of God, and all these ideas
are the reflection of the child and the savage and the animal in us
which we have still failed to transform or outgrow. We should
be inclined to wonder how these fancies of children found their
way into such profound philosophical religions as Buddhism
and Hinduism, if it were not so patent that men will not deny
themselves the luxury of tacking on the rubbish from their past
to the deeper thoughts of their sages.

No doubt, since these ideas were so prominent, they must
have had their use in training humanity. Perhaps even it is true
that the Supreme deals with the child soul according to its child-
ishness and allows it to continue its sensational imaginations of
heaven and hell for a time beyond the death of the physical body.
Perhaps both these ideas of after-life and of rebirth as fields of
punishment and reward were needed because suited to our half-
mentalised animality. But after a certain stage the system ceases
to be really effective. Men believe in Heaven and Hell but go on
sinning merrily, quit at last by a Papal indulgence or the final
priestly absolution or a death-bed repentance or a bath in the
Ganges or a sanctified death at Benares,—such are the childish
devices by which we escape from our childishness! And in the
end the mind grows adult and puts the whole nursery nonsense
away with contempt. The reward and punishment theory of
rebirth, if a little more elevated or at least less crudely sensa-
tional, comes to be as ineffective. And it is good that it should
be so. For it is intolerable that man with his divine capacity
should continue to be virtuous for a reward and shun sin out of
terror. Better a strong sinner than a selfish virtuous coward
or a petty hucksterer with God; there is more divinity in him, more capacity of elevation. Truly the Gita has said well, *krpaṇāḥ phalabetauḥ*. And it is inconceivable that the system of this vast and majestic world should have been founded on these petty and paltry motives. There is reason in these theories? then reason of the nursery, puerile. Ethics? then ethics of the mud, muddy.

The true foundation of the theory of rebirth is the evolution of the soul, or rather its efflorescence out of the veil of Matter and its gradual self-finding. Buddhism contained this truth involved in its theory of Karma and emergence out of Karma but failed to bring it to light; Hinduism knew it of old, but afterwards missed the right balance of its expression. Now we are again able to restate the ancient truth in a new language and this is already being done by certain schools of thought, though still the old incrustations tend to tack themselves on to the deeper wisdom. And if this gradual efflorescence be true, then the theory of rebirth is an intellectual necessity, a logically unavoidable corollary. But what is the aim of that evolution? Not conventional or interested virtue and the faultless counting out of the small coin of good in the hope of an apportioned material reward, but the continual growth towards a divine knowledge, strength, love and purity. These things alone are real virtue and this virtue is its own reward. The one true reward of the works of love is to grow ever in capacity and delight of love up to the ecstasy of the spirit’s all-seizing embrace and universal passion; the one reward of the works of right Knowledge is to grow perpetually into the infinite Light; the one reward of the works of right Power is to harbour more and more of the Force Divine, and of the works of purity to be freed more and more from egoism into that immaculate wideness where all things are transformed and reconciled into the divine equality. To seek other reward is to bind oneself to a foolishness and a childish ignorance; and to regard even these things as a reward is an unripeness and an imperfection.

And what of suffering and happiness, misfortune and prosperity? These are experiences of the soul in its training, helps, props, means, disciplines, tests, ordeals,—and prosperity often
a worse ordeal than suffering. Indeed, adversity, suffering may often be regarded rather as a reward to virtue than as a punishment for sin, since it turns out to be the greatest help and purifier of the soul struggling to unfold itself. To regard it merely as the stern award of a Judge, the anger of an irritated Ruler or even the mechanical recoil of result of evil upon cause of evil is to take the most superficial view possible of God's dealings with the soul and the law of the world's evolution. And what of worldly prosperity, wealth, progeny, the outward enjoyment of art, beauty, power? Good, if they be achieved without loss to the soul and enjoyed only as the outflowing of the divine Joy and Grace upon our material existence. But let us seek them first for others or rather for all, and for ourselves only as a part of the universal condition or as one means of bringing perfection nearer.

The soul needs no proof of its rebirth any more than it needs proof of its immortality. For there comes a time when it is consciously immortal, aware of itself in its eternal and immutable essence. Once that realisation is accomplished, all intellectual questionings for and against the immortality of the soul fall away like a vain clamour of ignorance around the self-evident and ever-present truth. Tato na vicikitsate. That is the true dynamic belief in immortality when it becomes to us not an intellectual dogma but a fact as evident as the physical fact of our breathing and as little in need of proof or argument. So also there comes a time when the soul becomes aware of itself in its eternal and mutable movement; it is then aware of the ages behind that constituted the present organisation of the movement, sees how this was prepared in an uninterrupted past, remembers something of the bygone soul-states, environments, particular forms of activity which built up its present constituents and knows to what it is moving by development in an uninterrupted future. This is the true dynamic belief in rebirth, and there too the play of the questioning intellect ceases; the soul's vision and the soul's memory are all. Certainly, there remains the question of the mechanism of the development and of the laws of rebirth where the intellect and its inquiries and

www.holybooks.com
generalisations can still have some play. And here the more one
thinks and experiences, the more the ordinary, simple, cut-and-
dried account of reincarnation seems to be of doubtful validity.
There is surely here a greater complexity, a law evolved with
a more difficult movement and a more intricate harmony out
of the possibilities of the Infinite. But this is a question which
demands long and ample consideration; for subtle is the law of
it. Aṇur ṭyeṣa dharmāḥ.
The Reincarnating Soul

HUMAN thought in the generality of men is no more than a rough and crude acceptance of unexamined ideas. Our mind is a sleepy or careless sentry and allows anything to pass the gates which seems to it decently garbed or wears a plausible appearance or can mumble anything that resembles some familiar password. Especially is this so in subtle matters, those remote from the concrete facts of our physical life and environment. Even men who will reason carefully and acutely in ordinary matters and there consider vigilance against error an intellectual or a practical duty, are yet content with the most careless stumbling when they get upon higher and more difficult ground. Where precision and subtle thinking are most needed, there they are most impatient of it and averse to the labour demanded of them. Men can manage fine thought about palpable things, but to think subtly about the subtle is too great a strain on the grossness of our intellects; so we are content with making a dab at the truth, like the painter who threw his brush at his picture when he could not get the effect that he desired. We mistake the smudge that results for the perfect form of a verity.

It is not surprising then that men should be content to think crudely about such a matter as rebirth. Those who accept it, take it usually ready-made, either as a cut-and-dried theory or a crude dogma. The soul is reborn in a new body, — that vague and almost meaningless assertion is for them sufficient. But what is the soul and what can possibly be meant by the rebirth of a soul? Well, it means reincarnation; the soul, whatever that may be, had got out of one case of flesh and is now getting into another case of flesh. It sounds simple, — let us say, like the Djinn of the Arabian tale expanding out of and again compressing himself into his bottle or perhaps as a pillow is lugged out of one pillow-case and thrust into another. Or the soul fashions for itself a body
in the mother's womb and then occupies it, or else, let us say, puts off one robe of flesh and then puts on another. But what is it that thus “leaves” one body and “enters” into another? Is it another, a psychic body and subtle form, that enters into the gross corporeal form,—the Purusha perhaps of the ancient image, no bigger than a man's thumb, or is it something in itself formless and impalpable that incarnates in the sense of becoming or assuming to the senses a palpable shape of bone and flesh?

In the ordinary, the vulgar conception there is no birth of a soul at all, but only the birth of a new body into the world occupied by an old personality unchanged from that which once left some now discarded physical frame. It is John Robinson who has gone out of the form of flesh he once occupied; it is John Robinson who tomorrow or some centuries hence will re-incarnate in another form of flesh and resume the course of his terrestrial experiences with another name and in another environment. Achilles, let us say, is reborn as Alexander, the son of Philip, a Macedonian, conqueror not of Hector but of Darius, with a wider scope, with larger destinies; but it is still Achilles, it is the same personality that is reborn, only the bodily circumstances are different. It is this survival of the identical personality that attracts the European mind today in the theory of reincarnation. For it is the extinction or dissolution of the personality, of this mental, nervous and physical composite which I call myself that is hard to bear for the man enamoured of life, and it is the promise of its survival and physical reappearance that is the great lure. The one objection that really stands in the way of its acceptance is the obvious non-survival of memory. Memory is the man, says the modern psychologist, and what is the use of the survival of my personality, if I do not remember my past, if I am not aware of being the same person still and always? What is the utility? Where is the enjoyment?

The old Indian thinkers,—I am not speaking of the popular belief which was crude enough and thought not at all about the matter,—the old Buddhistic and Vedantist thinkers surveyed the whole field from a very different standpoint. They were not attached to the survival of the personality; they did not
give to that survival the high name of immortality; they saw that personality being what it is, a constantly changing composite, the survival of an identical personality was a non-sense, a contradiction in terms. They perceived indeed that there is a continuity and they sought to discover what determines this continuity and whether the sense of identity which enters into it is an illusion or the representation of a fact, of a real truth, and, if the latter, then what that truth may be. The Buddhist denied any real identity. There is, he said, no self, no person; there is simply a continuous stream of energy in action like the continuous flowing of a river or the continuous burning of a flame. It is this continuity which creates in the mind the false sense of identity. I am not now the same person that I was a year ago, not even the same person that I was a moment ago, any more than the water flowing past yonder ghaut is the same water that flowed past it a few seconds ago; it is the persistence of the flow in the same channel that preserves the false appearance of identity. Obviously, then, there is no soul that reincarnates, but only Karma that persists in flowing continuously down an apparently uninterrupted channel. It is Karma that incarnates; Karma creates the form of a constantly changing mentality and physical bodies that are, we may presume, the result of that changing composite of ideas and sensations which I call myself. The identical “I” is not, never was, never will be. Practically, so long as the error of personality persists, this does not make much difference and I can say in the language of ignorance that I am reborn in a new body; practically, I have to proceed on the basis of that error. But there is this important point gained that it is all an error and an error which can cease; the composite can be broken up for good without any fresh formation, the flame can be extinguished, the channel which called itself a river destroyed. And then there is non-being, there is cessation, there is the release of the error from itself.

The Vedantist comes to a different conclusion; he admits an identical, a self, a persistent immutable reality, — but other than my personality, other than this composite which I call myself. In the Katha Upanishad the question is raised in a very instructive
fashion quite apposite to the subject we have in hand. Nachiketas, sent by his father to the world of Death, thus questions Yama, the lord of that world: Of the man who has gone forward, who has passed away from us, some say that he is and others “this he is not”; which then is right? what is the truth of the great passage? Such is the form of the question and at first sight it seems simply to raise the problem of immortality in the European sense of the word, the survival of the identical personality. But that is not what Nachiketas asks. He has already taken as the second of three boons offered to him by Yama the knowledge of the sacred Flame by which man crosses over hunger and thirst, leaves sorrow and fear far behind him and dwells in heaven securely rejoicing. Immortality in that sense he takes for granted as, already standing in that farther world, he must surely do. The knowledge he asks for involves the deeper, finer problem, of which Yama affirms that even the gods debated this of old and it is not easy to know, for subtle is the law of it; something survives that appears to be the same person, that descends into hell, that ascends into heaven, that returns upon the earth with a new body, but is it really the same person that thus survives? Can we really say of the man “He still is,” or must we not rather say “This he no longer is”? Yama too in his answer speaks not at all of the survival of death, and he only gives a verse or two to a bare description of that constant rebirth which all serious thinkers admitted as a universally acknowledged truth. What he speaks of is the Self, the real Man, the Lord of all these changing appearances; without the knowledge of that Self the survival of the personality is not immortal life but a constant passing from death to death; he only who goes beyond personality to the real Person becomes the Immortal. Till then a man seems indeed to be born again and again by the force of his knowledge and works, name succeeds to name, form gives place to form, but there is no immortality.

Such then is the real question put and answered so divergently by the Buddhist and the Vedantin. There is a constant reforming of personality in new bodies, but this personality is a mutable creation of force at its work streaming forward in
Time and never for a moment the same, and the ego-sense that makes us cling to the life of the body and believe readily that it is the same idea and form, that it is John Robinson who is reborn as Sidi Hossain, is a creation of the mentality. Achilles was not reborn as Alexander, but the stream of force in its works which created the momentarily changing mind and body of Achilles flowed on and created the momentarily changing mind and body of Alexander. Still, said the ancient Vedanta, there is yet something beyond this force in action, Master of it, one who makes it create for him new names and forms, and that is the Self, the Purusha, the Man, the Real Person. The ego-sense is only its distorted image reflected in the flowing stream of embodied mentality.

Is it then the Self that incarnates and reincarnates? But the Self is imperishable, immutable, unborn, undying. The Self is not born and does not exist in the body; rather the body is born and exists in the Self. For the Self is one everywhere, — in all bodies, we say, but really it is not confined and parcelled out in different bodies except as the all-constituting ether seems to be formed into different objects and is in a sense in them. Rather all these bodies are in the Self; but that also is a figment of space-conception, and rather these bodies are only symbols and figures of itself created by it in its own consciousness. Even what we call the individual soul is greater than its body and not less, more subtle than it and therefore not confined by its grossness. At death it does not leave its form, but casts it off, so that a great departing Soul can say of this death in vigorous phrase, “I have spat out the body.”

What then is it that we feel to inhabit the physical frame? What is it that the Soul draws out from the body when it casts off this partial physical robe which enveloped not it, but part of its members? What is it whose issuing out gives this wrench, this swift struggle and pain of parting, creates this sense of violent divorce? The answer does not help us much. It is the subtle or psychical frame which is tied to the physical by the heart-strings, by the cords of life-force, of nervous energy which have been woven into every physical fibre. This the Lord of
the body draws out and the violent snapping or the rapid or
tardy loosening of the life-cords, the exit of the connecting force
constitutes the pain of death and its difficulty.

Let us then change the form of the question and ask rather
what it is that reflects and accepts the mutable personality, since
the Self is immutable? We have in fact an immutable Self, a real
Person, lord of this ever-changing personality which, again, as-
sumes ever-changing bodies, but the real Self knows itself always
as above the mutation, watches and enjoys it, but is not involved
in it. Through what does it enjoy the changes and feel them to be
its own, even while knowing itself to be unaffected by them? The
mind and ego-sense are only inferior instruments; there must be
some more essential form of itself which the Real Man puts
forth, puts in front of itself, as it were, and at the back of the
changings to support and mirror them without being actually
changed by them. This more essential form is or seems to be in
man the mental being or mental person which the Upanishads
speak of as the mental leader of the life and body, manomayāḥ
prāṇa-sārīra-netā. It is that which maintains the ego-sense as a
function in the mind and enables us to have the firm conception
of continuous identity in Time as opposed to the timeless identity
of the Self.

The changing personality is not this mental person; it is a
composite of various stuff of Nature, a formation of Prakriti and
is not at all the Purusha. And it is a very complex composite with
many layers; there is a layer of physical, a layer of nervous, a
layer of mental, even a final stratum of supramental personality;
and within these layers themselves there are strata within each
stratum. The analysis of the successive couches of the earth is
a simple matter compared with the analysis of this wonderful
creation we call the personality. The mental being in resuming
bodily life forms a new personality for its new terrestrial exis-
tence; it takes material from the common matter-stuff, life-stuff,
mind-stuff of the physical world and during earthly life it is
constantly absorbing fresh material, throwing out what is used
up, changing its bodily, nervous and mental tissues. But this is
all surface work; behind is the foundation of past experience
held back from the physical memory so that the superficial consciousness may not be troubled or interfered with by the conscious burden of the past but may concentrate on the work immediately in hand. Still that foundation of past experience is the bedrock of personality; and it is more than that. It is our real fund on which we can always draw even apart from our present superficial commerce with our surroundings. That commerce adds to our gains, modifies the foundation for a subsequent existence.

Moreover, all this is, again, on the surface. It is only a small part of ourselves which lives and acts in the energies of our earthly existence. As behind the physical universe there are worlds of which ours is only a last result, so also within us there are worlds of our self-existence which throw out this external form of our being. The subconscient, the superconscient are oceans from which and to which this river flows. Therefore to speak of ourselves as a soul reincarnating is to give altogether too simple an appearance to the miracle of our existence; it puts into too ready and too gross a formula the magic of the supreme Magician. There is not a definite psychic entity getting into a new case of flesh; there is a metempsychosis, a reinsouling, a rebirth of new psychic personality as well as a birth of a new body. And behind is the Person, the unchanging entity, the Master who manipulates this complex material, the Artificer of this wondrous artifice.

This is the starting-point from which we have to proceed in considering the problem of rebirth. To view ourselves as such and such a personality getting into a new case of flesh is to stumble about in the ignorance, to confirm the error of the material mind and the senses. The body is a convenience, the personality is a constant formation for whose development action and experience are the instruments; but the Self by whose will and for whose delight all this is, is other than the body, other than the action and experience, other than the personality which they develop. To ignore it is to ignore the whole secret of our being.
Rebirth, Evolution, Heredity

TWO TRUTHS, discoveries with an enormous periphery of luminous result and of a considerable essential magnitude, evolution and heredity, figure today in the front of thought, and I suppose we have to take them as a well-established unquenchable light upon our being, lamps of a constant lustre, though not yet very perfectly trimmed, final so far as anything is final in man’s constantly changing cinematographic process of the development of intellectual knowledge. They may be said to make up almost the whole fundamental idea of life in the way of seeing peculiar to a mind dominated, fashioned, pressed into its powerful moulds by the exact, curious, multifariously searching, yet in the end singularly limited observation and singularly narrow reason of our modern science. Science is in her own way a great seer and magician; she has both the microscopic and the macroscopic, the closely gazing and the telescopic view, a dissolving power of searching analytic resolution, a creative power of revealing synthetic effectuation. She has hunted to their lair many of the intermediate secret processes of the great creatrix, and even she has been able, by the inventive faculty given to us, to go and do one better. Man, this midget in infinity, locomotive yet nailed to the contiguity of a petty crust of soil by the force of gravitation, has certainly scored by her a goodly number of points against the mother of the universe. But all this has been done in some perfection only in the limits of her lowest obtrusive physical field.

Face to face with psychic and spiritual secrecies, as in the open elementary world even of mind, Science has still the uninformed gaze and the groping hands of the infant. In that sphere she, so precise, illuminative, compelling in the physical, sees only the big blazing buzzing confusion which James tells us, with a possibly inaccurate vividness of alliterative phrase,
the newborn baby’s view of the sensible world into which he has dropped down the mysterious stairs of birth. Science, faced with what are still to her the wonderful random accords and unexplained miracles of consciousness, protects herself from the errors of the imagination,—but stumbling incidentally by that very fact into plenty of the errors of an inadequate induction,—behind an opaque shield of cautious scepticism. She clings with the grasping firmness of the half-drowned to planks of security she thinks she has got in a few well-tested correspondences,—so-styled, though the word as used explains nothing,—between mental action and its accompaniment of suggestive or instrumental physical functionings. She is determined, if she can, to explain every supraphysical phenomenon by some physical fact; psychological process of mind must not exist except as result or rendering of physiological process of body. This set resolution, apparently rational and cautious of ascertainable and firmly tangible truth, but really heroic in its paradoxical temerity, shuts up her chance of rapid discovery, for the present at least, in a fairly narrow circle. It taints too her extensions of physical truth into the psychological field with a pursuing sense of inadequacy. And this inadequacy in extended application is very evident in her theories of heredity and evolution when she forces them beyond their safe ground of physical truth and labours to illumine by them the subtle, complex, elusive phenomena of our psychological being.

There are still, I dare say, persons here and there who cherish a secret or an open unfaith in the theory of a physical evolution and believe that it will one day pass into the limbo of dead generalisations like the Ptolemaic theory in astronomy or like the theory of humours in medicine; but this is a rare and excessive scepticism. Yet it may not be without use or aptitude for our purpose to note that contrary to current popular notions the scientific account of this generalisation, like that of a good number of others, is not yet conclusively proved, even though now taken for granted. But still there is on the whole a mass of facts and indications in its favour so considerable as to look overwhelming, so that we cannot resist the conclusion that in
this way or some such way the whole thing came about and we find it difficult to conceive any more convincing explanation of the indubitable ascending and branching scale of genus and species which meets even our casual scrutiny of living existence. One thing at least seems now intellectually certain, we can no longer believe that these suns and systems were hurled full-shaped and eternally arranged into boundless space and all these numberless species of being planted on earth ready-made and nicely tailored in seven days or any number of days in a sudden outburst of caprice or Dionysiac excitement or crowded activity of mechanical conception by the fiat of a timeless Creator. The successive development which was summarily proposed by the ancient Hindu thinkers, the lower forms of being first, man afterwards as the crown of the Spirit's development of life on earth, has been confirmed by the patient and detailed scrutiny of physical science,—an aeonic development, though the farther Hindu conception of a constant repetition of the principle in cycles is necessarily incapable of physical evidence.

One thing more seems now equally certain that not only the seed of all life was one,—again the great intuition of the Upanishads foreruns the conclusions of the physical enquiry, one seed which the universal self-existence by process of force has disposed in many ways, ekåm bijåm bahudhå śakti-yogåt, —but even the principle of development is one and the structural ground-plan too as it develops step by step, in spite of all departures to this side or that in the workings of the creative Force or the creative Idea. Nature seems to start with an extraordinary poverty of original broad variative conceptions and to proceed to an extraordinary richness of her minuter consequential variations, which amounts to a forging of constant subtle differentiations of species and in the individual a startling insistence on result of uniqueness. It almost looks as if in the process of her physical harmonies there was meant to be some formal effect or symbolic reproduction of the truth that all things are originally one being, but a one who insists on his own infinite diversity, and even a suggestion that there is in this eternal unity an eternal pluralism, the Infinite Being self-repeated in an infinite
multiplicity of beings each unique and yet each the One. To a mind on the look-out for the metaphysical suggestions we can draw from the apparent facts of being, that might not seem altogether an imagination.

In any case we have this now patent order in the profuse complexities of the natural harmony of living things, — one plasmic seed, one developing ground-plan, an opulent number of varieties whose logical process would be by an ascending order which passes up through fine but still very distinct gradations from the crude to the complex, from the less organised to the more organised, from the inferior to the superior type. The first question that should strike the mind at once, when this tree of life has been seen, is whether this logical order was indeed the actual order in the history of the universe, and then, a second, naturally arising from that problem, whether, if so, each new form developed by variation from its natural predecessor or came in by some unknown process, a fresh, independent and in a way sudden creation. In the first case, we have the scientific order of physical evolution, — in the other one knows not well what, perhaps an unseen Demiurge who developed the whole thing in the earlier period of the earth evolution and has now wholly or almost entirely stopped the business so that we have no new physical development of that kind, but only, it may be, an evolution of capacity in types already created. Science stands out for a quite natural and mechanical, a quite unbroken physical evolution with many divergent lines indeed of developing variation, but in the line no gap or interstice. It is true that there are not one but a host of missing links, which even the richest remains of the past cannot fill in, and we are not in a position to deny with an absolute dogmatism the possibility of an advance per saltum, by a rapid overleaping, perhaps even by a crowded psychical or bio-psychic preparation whose result sprang out in the appearance of a new type with a certain gulf between itself and the preceding forms of life. With regard to man especially there is still an enormous uncertainty as to how he, so like yet so different from the other sons of Nature, came into existence. Still the gaps can be explained away, there is a great mass of
telling facts in favour of the less physically anarchic view, and it seems to have on its side the right of greatest probability in a material universe where the most perfectly physical principle of proceeding would seem to be the just basic law.

But even if we admit the most scrupulous and rigorous continuity of successive determination, the question arises whether the process of evolution has been indeed so exclusively physical and biological as at first sight it looks. If it is, we must admit not only a rigorous principle of class heredity, but a law of hereditary progressive variation and a purely physical cause of all mental and spiritual phenomena. Heredity by itself means simply the constant transmission of physical form and biological characteristics from a previous life to its posterity. There is very evidently such a general force of hereditary transmission within the genus or species itself, as the tree so the seed, as the seed so the tree, so that a lion generates a lion and not a cat or a rhinoceros, a man a human being and not an ourang-outang, — though one reads now of a curious and startling speculation, turning the old theory topsy-turvy, that certain ape kinds may be, not ancestors, but degenerate descendants of man! But farther, if a physical evolution is the whole fact, there must be a capacity for the hereditary transmission of variations by which new species are or have been created,—not merely in the process of a mixture or crossing, but by an internal development which is stored up and handed down in the seed. That too may very well be admitted, even though its real process and rationale are not yet understood, since the transmission of family and individual characteristics is a well-observed phenomenon. But then the things transmitted are not only physical and biological, but psychological or at least bio-psychic characters, repetitions of customary nervous experience and mental tendency, powers. We have to suppose that the physical seed transmits these things. We are called upon to admit that the human seed for instance, which does not contain a developed human consciousness, yet carries with it the powers of such a consciousness so that they reproduce themselves automatically in the thinking and organised mentality of the offspring. This, even if we have to accept
it, is an inexplicable paradox unless we suppose either that there is something more behind, a psychical power behind the veil of material process, or else that mind is only a process of life and life only a process of matter. Therefore finally we have to suppose the physical theory capable of explaining by purely material causes and a material constitution the mystery of the emergence of life in matter and the equal mystery of the emergence of mind in life. It is here that difficulties begin to crowd in which convict it, so far at least, of a hopeless inadequacy, and the nature of that inadequacy, its crux, its stumbling-point leave room for just that something behind, something psychical, a hidden soul process and for a more complex and less materialistic account of the truth of evolution.

The materialistic assumption — it is no more than a hypothetical assumption, for it has never been proved — is that development of non-living matter results under certain unknown conditions in a phenomenon of unconscious life which is in its real nature only an action and reaction of material energy, and the development of that again under certain unknown conditions in a phenomenon of conscious mind which is again in its real nature only an action and reaction of material energy. The thing is not proved, but that, it is argued, does not matter; it only means that we do not yet know enough; but one day we shall know, — the necessary physiological reaction called by us an intuition or train of reasoning crowned by discovery having, I suppose, taken place in a properly constituted nervous body and the more richly convoluted brain of a Galileo of biology, — and then this great and simple truth will be proved, like many other things once scoffed at by the shallow common sense of humanity. But the difficulty is that it seems incapable of proof. Even with regard to life, which is by a great deal the lesser difficulty, the discovery of certain chemical or other physical and mechanical conditions under which life can be stimulated to appear, will prove no more than that these are the favourable or necessary conditions for the manifestation of life in body, — such conditions there must be in the nature of things, — but not that life is not another new and higher power of the force of universal being. The connection of
life responses with physical conditions and stimuli proves very clearly that life and matter are connected and that, as indeed they must do to coexist, the two kinds of energy act on each other, — a very ancient knowledge; but it does not get rid of the fact that the physical response is accompanied by an element which seems to be of the nature of a nervous excitement and an incipient or suppressed consciousness and is not the same thing as the companion physical reaction.

When we come to mind, we see — how could it be otherwise in an embodied mind? — a response, interaction, connection, a correspondence if you will; but no amount of correspondence can show how a physical response can be converted into or amount to or by itself constitute in result a conscious operation, a perception, emotion, thought-concept, or prove that love is a chemical product or that Plato’s theory of ideas or Homer’s Iliad or the cosmic consciousness of the Yogin was only a combination of physiological reactions or a complex of the changes of grey brain matter or a flaming marvel of electrical discharges. It is not only that common sense and imagination boggle at these theories, — that objection may be disregarded, — not only that perception, reason and intuition have to be thrust aside in favour of a forced and too extended inference, but that there is a gulf of difference here between the thing to be explained and the thing by which it is sought to explain it which cannot be filled up, however much we may admit nervous connections and psycho-physical bridges. And if the physical scientist points to a number of indicative facts and hopes one day to triumph over these formidable difficulties, there is growing up on the other side an incipient mass of psychical phenomena which are likely to drown his theory in fathomless waters. The insuperability of these always evident objections is beginning to be more widely recognised, but since the past still holds considerable sway, it is necessary to insist on them so that we may have the clear right to go on to more liberal hypotheses which do not try prematurely to reduce to a mechanical simplicity the problem of our being.

One of these is the ancient view that not only incidence of body and life on mind and soul, but incidence of mind and
soul on body and life have to be considered. Here too there is
the evolutionary idea, but physical and life evolution, even the
growth of mind, are held to be only incidental to a soul evolution
of which Time is the course and the earth among many other
worlds the theatre. In the old Indian version of this theory evolu-
tion, heredity and rebirth are three companion processes of the
universal unfolding, evolution the processional aim, rebirth the
main method, heredity one of the physical conditions. That is a
theory which provides at least the framework for a harmonious
explanation of all the complex elements of the problem. The
scientific idea starts from physical being and makes the psychical
a result and circumstance of body; this other evolutionary idea
starts from soul and sees in the physical being an instrumentation
for the awakening to itself of a spirit absorbed in the universe
of Matter.
Rebirth and Soul Evolution

The ideas that men currently form about life and things are for the most part pragmatic constructions. They are forms of a reason which is concerned with giving only such a serviceable account to itself of its surroundings as shall make a sufficient clue to our immediate business of the growth, action, satisfaction of the personality, something feasible, liveable, effective for our journeying in Time, something viable in the twofold French sense of the word. Whether it corresponds to or is directly in touch with any real reality of things seems to be very much a matter of accident. It seems to be sufficient if we can persuade our facile and complaisant reason of its truth and find it serviceable and fruitful in consequences for thought, action and life-experience. It is true that there is another unpragmatic reason in us which labours to get rid of this demand of the intellectual and vital personality; it wants to look at the real truth of things without veils and without any object, to mirror the very image of Truth in the still waters of a dispassionate, clear and pure mentality. But the workings of this calmer greater reason are hampered by two tremendous difficulties. First, it seems next to impossible to disengage it entirely from the rest of ourselves, from the normal intellectuality, from the will to believe, from that instinct of the intelligence which helps the survival, by a sort of subtle principle of preference and selection, of the way of thinking that suits our personal bent or the accomplished frame of our nature. And again, what is the Truth that our reason mirrors? It is after all some indirect image of Truth, not her very self and body seen face to face; it is an image moulded from such data, symbol, process of Reality,—if any real Reality there is,—as we can gather from the very limited experience of self and existing things open to human mind. So that unless there be some means by which knowledge can burst through all veils
The Problem of Rebirth

to the experience of the very Reality itself, or unless there be some universal Logos, divine Mind or Supermind, which knows itself and all things and our consciousness can reflect or get into touch with that, a pursuing insufficiency and uncertainty must always keep its baffling grasp upon even the highest power and largest walk of our reason and beset all the labour of human knowledge.

Nowhere are these disabilities more embarrassing than in those fundamental questions of the nature of the world and of our own existence which yet most passionately interest thinking humanity because this is in the end the thing of utmost importance to us, since everything else, except some rough immediate practicality of the moment, depends on its solution. And even that, until this great question is settled, is only a stumbling forward upon a journey of which we know not the goal or the purpose, the meaning or the necessity. The religions profess to solve these grand problems with an inspired or revealed certainty; but the enormity of their differences shows that in them too there is a selection of ideas, separate aspects of the Truth, — the sceptic would say, shows of imagination and falsehood, — and a construction from a limited spiritual experience. In them too there is an element of chosen and willed believing and some high pragmatic aim and utility, whether that be the soul’s escape from the sorrow or unreality of existence or celestial bliss or a religio-ethical sanction and guidance. The philosophical systems are very obviously only feasible selective constructions of great reflective ideas. More often these are possibilities of the reason much rather than assured certainties or, if founded on spiritual experience, they are still selective constructions, a sort of great architectural approach to some gate into unknowable Divine or ineffable Infinite. The modern scientific mind professed to rid us of all mere intellectual constructions and put us face to face with truth and with assured truth only; it claimed the right to rid man of the fantastic encumbrance of religion and the nebulous futilities of metaphysical philosophy. But religion and philosophy have now turned upon science and convicted her, on her own statement of facts, of an equal liability to the two
universal difficulties of human reason. The system of science seems to be itself only another feasible and fruitful construction of the reason giving a serviceable account to itself of the physical world and our relations to it, and it seems to be nothing more. And its knowledge is fatally bound by the limitation of its data and its outlook. Science too creates only a partial image of Truth stamped with a character of much uncertainty and still more clearly imprinted with the perverse hallmark of insufficiency.

We have to recognise that human reason, moving as it does from a starting-point of ignorance and in a great environing circle of ignorance, must proceed by hypothesis, assumption and theory subject to verification of some kind convincing to our reason and experience. But there is this difference that the religious mind accepts the theory or assumption, — to which it does not at all give these names, for they are to it things felt, — with faith, with a will of belief, with an emotional certainty, and finds its verification in an increasing spiritual intuition and experience. The philosophic mind accepts it calmly and discerningly for its coherent agreement with the facts and necessities of being; it verifies by a pervading and unfailing harmony with all the demands of reason and intellectualised intuition. But the sceptical mind — not the mind of mere doubt or dogmatic denial which usually arrogates that name, but the open and balanced mind of careful, impartial and reserved inquiry, — gives a certain provisional character to its hypotheses, and it verifies by the justification of whatever order or category of ascertainable facts it takes for its standard of proof and invests with a character of decisive authority or reality. There is room enough for all three methods and there is no reason why our complex modern mind should not proceed simultaneously by all of them at once. For if the sceptical or provisional attitude makes us more ready to modify our image of Truth in the light of new material of thought and knowledge, the religious mind also, provided it keeps a certain firm and profound openness to new spiritual experience, can proceed faster to a larger and larger light, and meanwhile we can walk by it with an assured step and go securely about our principal business of the growth and perfection of our being. The
philosophic mind has the use of giving a needed largeness and openness to our mentality, — if it too does not narrow itself by a closed circle of metaphysical dogma, — and supports besides the harmony of our other action by the orderly assent of the higher reason.

In this matter of the soul and rebirth the initial hypothesis now lies quite open to us; the barrier has fallen. For if there is one thing now certain it is that physical science may give clues of process, but cannot lay hold on the reality of things. That means that the physical is not the whole secret of world and existence, and that in ourselves too the body is not the whole of our being. It is then through something supraphysical in Nature and ourselves which we may call the soul, whatever the exact substance of soul may be, that we are likely to get that greater truth and subtler experience which will enlarge the narrow rigid circle traced by physical science and bring us nearer to the Reality. There is nothing now to bar the most rational mind, — for true rationalism, real free thought need no longer be identified, as it was for some time too hastily and intolerantly, with a denial of the soul and a scouting of the truths of spiritual philosophy and religion, — there is nothing to prevent us from proceeding firmly upon whatever certitudes of spiritual experience have become to us the soil of our inner growth or the pillars on our road to self-knowledge. These are soul realities. But the exact frame we shall give to that knowledge, will best be built by farther spiritual experience aided by new enlarged intuitions, confirmed in the suggestions of a wide philosophic reason and fruitfully using whatever helpful facts we may get from the physical and the psychic sciences. These are truths of soul process; their full light must come by experimental knowledge and observation of the world without us and the world within.

The admission of the soul’s existence does not of itself lead, by its own necessity, by any indispensable next step, to the acceptance of rebirth. It will only bring in this indispensable consequence if there is such a thing as a soul evolution which enforces itself always and is a constant part of the order of existence and the law of the time process. Moreover some kind
of admission of an individual soul is a first condition of the truth of rebirth. For there is a plausible theory of existence which admits an All-Soul, a universal being and becoming of which the material world is some sensible result, but does not admit any at all abiding truth of our spiritual individuality. The All-Soul may continually develop, may slowly yet urgently evolve its becoming; but each individual man or apparent individual being is to this way of thinking only a moment of the All-Soul and its evolution; out of that it rises by the formation which we call birth and it sinks back into it by the dissolution which we call death. But this limiting idea can only stand if we credit a creative biological evolution and its instrument of physical heredity with the whole causation of all our mental and spiritual being; but in that case we have no real soul or spirit, our soul personality or spiritual becoming is a fruit of our life and body.

Now the question of rebirth turns almost entirely upon the one fundamental question of the past of the individual being and its future. If the creation of the whole nature is to be credited to the physical birth, then the body, life and soul of the individual are only a continuation of the body, life and soul of his ancestry, and there is no room anywhere for soul rebirth. The individual man has no past being independent of them and can have no independent future; he can prolong himself in his progeny, — the child may be his second or continued self, as the Upanishad puts it, — but there is no other rebirth for him. No continued stream of individuality presided over by any mental or spiritual person victoriously survives the dissolution of the body. On the other hand, if there is any element in us, still more the most important of all, which cannot be so accounted for, but presupposes a past or admits a future evolution other than that of the race mind and the physical ancestry, then some kind of soul birth becomes a logical necessity.

Now it is just here that the claims of physical and vital evolution and heredity seem to fail, — as a cause of our whole mental and spiritual being. Certainly it has been shown that our body and the most physical part of our life action are very largely the results of heredity, but not in such a way as to exclude an
assisting and perhaps really predominant psychical cause other than the ancestral contribution. It has been shown if you will that our conscious vitality and those parts of mind which depend upon it, something of temperament, something of character, certain impulses and predispositions, are to a great extent shaped — or is it only influenced? — by evolutionary heredity; but not that they are entirely due to this force, not that there is no soul, no spiritual entity which accepts and makes use of this instrumentation, but is not its created result or helplessly subject to it in its becoming. Still more are the higher parts of our mind marked with a certain stamp of spiritual independence. They are not altogether helpless formations of evolutionary heredity. But still all these things are evidently very much under the influence of environment and its pressures and opportunities. And we may draw from that, if we choose, a limiting conclusion; we may say that they are a phase of the universal soul, a part of the process of its evolution by selection; the race, not the individual, is the continuous factor and all our individual effort and acquisition, only in appearance, not really independent, ceases with death, except so much of our gain as is chosen to be carried on in the race by some secret will or conscious necessity in the universal being or the persistent becoming.

But when we come to our highest spiritual elements, we find that here we do arrive at a very clear and sovereign independence. We can carry on far beyond any determination by environment or the pressure of the race-soul our own soul evolution by the governing force of our spiritual nature. Quite apart from any evidence of an after-life on other planes or any memory of past births, this is sufficient warrant for a refusal to accept as sufficient any theory of the ephemeral being of the individual and the sole truth of the evolutionary Universal. Certainly, the individual being is not thereby shown to be independent of the All-Soul; it may be nothing but a form of it in time. But it is sufficient for our purpose that it is a persistent soul form, not determined by the life of the body and ceasing with its dissolution, but persisting independently beyond. For if it is thus independent of the physical race continuity in the future, if
it thus shows itself capable of determining its own future soul evolution in time, it must have had secretly such an independent existence all through and it must have been determining in reality, though no doubt by some other and indirect insistence, its past soul evolution too in time. Possibly it may exist in the All-Soul only during the universal continuity, may have arisen from it in that, may pass into it eventually. Or on the contrary it may exist in it prior to, or it is better to say, independent of the universal continuity, and there may be some kind of eternal individual. But it is sufficient for the theory of rebirth that a secret soul continuity of the individual does exist and not alone a brute succession of bodies informed by the All-Soul with a quite ephemeral illusion of mental or spiritual individuality.

There are theories of existence which accept the individual soul, but not soul evolution. There is, for instance, that singular dogma of a soul without a past but with a future, created by the birth of the body but indestructible by the death of the body. But this is a violent and irrational assumption, an imagination unverified and without verisimilitude. It involves the difficulty of a creature beginning in time but enduring through all eternity, an immortal being dependent for its existence on an act of physical generation, yet itself always and entirely unphysical and independent of the body which results from the generation. These are objections insuperable to the reason. But there is too the difficulty that this soul inherits a past for which it is in no way responsible, or is burdened with mastering propensities imposed on it not by its own act, and is yet responsible for its future which is treated as if it were in no way determined by that often deplorable inheritance, damnosa hereditas, or that unfair creation, and were entirely of its own making. We are made helplessly what we are and are yet responsible for what we are, — or at least for what we shall be hereafter, which is inevitably determined to a large extent by what we are originally. And we have only this one chance. Plato and the Hottentot, the fortunate child of saints or Rishis and the born and trained criminal plunged from beginning to end in the lowest fetid corruption of a great modern city have equally to create by the action or belief
of this one unequal life all their eternal future. This is a paradox which offends both the soul and the reason, the ethical sense and the spiritual intuition.

There is too the kindred idea, behind which a truth obscurely glimmers, that the soul of man is something high, pure and great which has fallen into the material existence and by its use of its nature and its acts in the body must redeem itself, must return to its own celestial nature. But it is evident that this one earthly life is not sufficient for all to effect that difficult return, but rather most may and do miss it entirely; and we have then either to suppose that an immortal soul can perish or be doomed to eternal perdition or else that it has more existences than this poor precarious one apparently given to it, lives or states of being which intervene between its fall and the final working out of a sure redemption. But the first supposition is subject to all the difficulties of that other paradox. Apart from the problem of the reason of the descent, it is difficult to see how straight from celestial being these different souls should have lapsed immediately to such immense differences of gradation in their fall and in such a way that each is responsible for the otherwise cruel and unequal conditions under which he has to determine so summarily his eternal future. Each must surely have had a past which made him responsible for his present conditions, if he is to be held thus strictly to account for all their results and the use he makes of his often too scanty, grudging and sometimes quite hopeless opportunity. The very nature of our humanity supposes a varying constituent past for the soul as well as a resultant future.

More reasonable therefore is a recent theory which suggests that a spirit or mental being has descended from another and greater plane and taken up the material existence when the physical and the animal evolution had proceeded far enough for a human embodiment upon earth to be possible. He looks back to a long series of human lives, beginning from that point, which has brought each of us to his present condition, and forward to a still continuing series which will carry all by their own degrees and in their own time to whatever completion, transfiguration,
return awaits the self-embodying human soul and is the crown of its long endeavour. But here again, what is it that brings about this connection of a spiritual being and higher mental nature and a physical being and lower animal nature? what necessitates this taking up of the lower life by the spirit which here becomes man? It would seem surely that there must have been some previous connection; the possessing mental or spiritual being must all the time have been preparing this lower life it thus occupies for a human manifestation. The whole evolution would then be an ordered continuity from the beginning and the intervention of mind and spirit would be no sudden inexplicable miracle, but a coming forward of that which was always there behind, an open taking up of the manifested life by a power which was always secretly presiding over the life evolution.

What this theory of rebirth supposes is an evolution of being in the material world from matter to embodied mind and a universal spirit which ensouls this evolution, while our individual spirits exist in the universal and follow their upward course to whatever purposed consummation or liberation or both may beckon to us at its end. Much more than this it may mean, but this at least; a soul evolution the real fact, an assumption of higher and higher forms the first appearance. We might indeed allow a past and future for the human soul, but place them below and above this terrestrial plane and admit only one casual or purposeful existence upon earth. But this would mean two orders of progressive existence unconnected and yet meeting for a brief moment. There would be an errant individual human soul intervening in the ordered terrestrial evolution and almost immediately passing out without any connecting cause or necessity. But especially it leaves insufficiently explained the phenomenon of the largely terrestrial animal being and nature of this spiritual and supra-terrestrial entity, this soul, its struggle for liberation, and the infinitely varying degrees in which in different bodies it has succeeded in dominating the lower nature. A past terrestrial soul evolution sufficiently accounting for these variations and degrees of our mixed being and a future soul evolution that helps us progressively to liberate the godhead of the spirit, seem
the only just and reasonable explanation of this labour of a matter-shackled soul which has attained a variable degree of humanity in the midst of a general progressive appearance of the life, mind and spirit in a material universe. Rebirth is the only possible machinery for such a soul evolution.
The Significance of Rebirth

The ONE question which through all its complexities is the sum of philosophy and to which all human enquiry comes round in the end, is the problem of ourselves,—why we are here and what we are, and what is behind and before and around us, and what we are to do with ourselves, our inner significances and our outer environment. In the idea of evolutionary rebirth, if we can once find it to be a truth and recognise its antecedents and consequences, we have a very sufficient clue for an answer to all these connected sides of the one perpetual question. A spiritual evolution of which our universe is the scene and earth its ground and stage, though its plan is still kept back above from our yet limited knowledge,—this way of seeing existence is a luminous key which we can fit into many doors of obscurity. But we have to look at it in the right focus, to get its true proportions and, especially, to see it in its spiritual significance more than in its mechanical process. The failure to do that rightly will involve us in much philosophical finessing, drive on this side or the other to exaggerated negations and leave our statement of it, however perfect may be its logic, yet unsatisfying and unconvincing to the total intelligence and the complex soul of humanity.

The bare idea of repeated births as the process of our soul existence does not carry us much farther than the simple material reality of this single life in the body, that first fact of our conscious sensation and memory which is the occasion of all our speculations. Behind our present starting-point and preceding this one lappet of our race in the fields of being rebirth reminds us indeed of a past, of pregnant anterior courses, a soul-existence in many previous bodies which have immediately created what we now are. But to what use or advantage if there is no progressive significance in our pre-existence and our persevering continuity?
In front of us it rolls far back from our vision the obstruction of the near blank wall of death; our journeying upon earth becomes less of a long or brief untraceable road ending abruptly and perplexingly in a cul-de-sac; our physical dissolution is robbed of the cruelest poison of its sting. For the burden of death to man the thinking, willing, feeling creature is not the loss of this poor case or chariot of body, but it is the blind psychical finality death suggests, the stupid material end of our will and thought and aspiration and endeavour, the brute breaking off of the heart’s kind and sweet relations and affections, the futile convicting discontinuity of that marvellous and all-supporting soul-sense which gives us our radiant glimpses of the glory and delight of existence, — that is the discord and harsh inconsequence against which the thinking living creature revolts as incredible and inadmissible. The fiery straining to immortality of our life, mind, psyche, which can assent to cessation only by turning in enmity upon their own flame of nature, and the denial of it which the dull acquiescence of a body consenting inertly to death as to life brings in on us, is the whole painful irreconcilable contradiction of our double nature. Rebirth takes the difficulty and solves it in the sense of a soul continuity with a beat of physical repetition. Like other non-materialistic solutions it gives the right to the soul’s suggestion as against the body’s and sanctions the demand for survival, but unlike some others it justifies the bodily life by its utility to the soul’s continued self-experience; our too swift act in the body ceases to be an isolated accident or an abrupt interlude, it gets the justification of a fulfilling future as well as a creating past for its otherwise haphazard actions and relations. But simple persistence, mechanical continuity is not enough; that is not all our psychical being signifies, not the whole luminous meaning of survival and continuity; without ascension, without expansion, without some growing up straight into light in the strength of our spirit our higher members toil here uncompleted, our birth in matter is not justified by any adequate meaning. We are very little better off than if death remained our ending; for our life in the end becomes then an indefinitely continued and renewed and temporarily consequent
in place of an inconsequent, abruptly ended and soon convicted futility.

By rebirth, too, this world around us, our environment, its suggestions, its opportunities are no longer left as the field of an ephemeral physical flowering or as a Life which cares very little for and means very little to the individual, though it may offer much perhaps during its uncertain longer time to the species. The world grows to us a field of soul-experience, a system of soul-recurrences, a means of self-effectuation, perhaps a crystallising of the conscious being’s effective self-reflections. But to what end if our recurrence is only a repetition or a hesitating fluctuation within a few set types with a very limited, always uncompleted circle of accomplishment? For that is what it comes to, if there is no upward outlet, no infinite progression or no escape or enlarging into the soul’s infinities. Rebirth tells us that what we are is a soul performing constantly the miracle of self-embodiment; but why this embodiment, what this soul has to do here with itself and what use it is to make of this world which is given to it for its grandiose scene, its difficult, plastic material and its besieging battery of multiform stimulus and suggestions, is hardly at all clearer than before. But the perception of rebirth as an occasion and means for a spiritual evolution fills in every hiatus. It makes life a significant ascension and not a mechanical recurrence; it opens to us the divine vistas of a growing soul; it makes the worlds a nexus of spiritual self-expansion; it sets us seeking, and with a sure promise to all of a great finding now or hereafter, for the self-knowledge of our spirit and the self-fulfilment of a wise and divine intention in our existence.

The oppressing sense of a circle of mechanical recurrence and the passionate seeking for an outlet of absolute escape haunted the earlier statements of the truth of rebirth and have left upon them in spite of the depths they fathomed a certain stamp of unsatisfactory inadequacy, — not illogical, for they are logical enough, once their premisses are admitted, but unsatisfying, because they do not justify to us our being. For, missing the divine utility of the cosmic workings, they fail to explain to us with a sufficiently large, patient, steadfast wholeness God
and ourselves and existence, negate too much, miss the positive sense of our strain and leave sounding an immense note of spiritual futility and cosmic discord. No statement of the sense of our being or our non-being has laid a more insistent stress on rebirth than did the Buddhistic; but it affirms strongly only the more strongly to negate. It views the recurrence of birth as a prolonged mechanical chain; it sees, with a sense of suffering and distaste, the eternal revolving of an immense cosmic wheel of energy with no divine sense in its revolutions, its beginning an affirmation of ignorant desire, its end a nullifying bliss of escape. The wheel turns uselessly for ever disturbing the peace of Non-being and creating souls whose one difficult chance and whole ideal business is to cease. That conception of being is only an extension from our first matter-governed sense of the universe, of our creation in it and of our decisive cessation. It takes up at every point our first obvious view of the bodily life and restates all its circumstances in the terms of a more psychical and spiritual idea of our existence.

What we see in the material universe is a stupendous system of mechanical recurrences. A huge mechanical recurrence rules that which is long-enduring and vast; a similar but frailer mechanical recurrence sways all that is ephemeral and small. The suns leap up into being, flame wheeling in space, squander force by motion and fade and are extinct, again perhaps to blaze into being and repeat their course, or else other suns take their place and fulfil their round. The seasons of Time repeat their unending and unchanging cycle. Always the tree of life puts forth its various flowers and sheds them and breaks into the same flowers in their recurring season. The body of man is born and grows and decays and perishes, but it gives birth to other bodies which maintain the one same futile cycle. What baffles the intelligence in all this intent and persistent process is that it seems to have in it no soul of meaning, no significance except the simple fact of causeless and purposeless existence dogged or relieved by the annulling or the compensating fact of individual cessation. And this is because we perceive the mechanism, but do not see the Power that uses the mechanism and the intention
The Significance of Rebirth

in its use. But the moment we know that there is a conscious Spirit self-wise and infinite brooding upon the universe and a secret slowly self-finding soul in things, we get to the necessity of an idea in its consciousness, a thing conceived, willed, set in motion and securely to be done, progressively to be fulfilled by these great deliberate workings.

But the Buddhistic statement admits no self, spirit or eternal Being in its rigorously mechanical economy of existence. It takes only the phenomenon of a constant becoming and elevates that from the physical to the psychical level. As there is evident to our physical mind an Energy, action, motion, capable of creating by its material forces the forms and powers of the material universe, so there is for the Buddhistic vision of things an Energy, action, Karma, creating by its psychic powers of idea and association this embodied soul life with its continuity of recurrences. As the body is a dissoluble construction, a composite and combination, so the soul too is a dissoluble construction and combination; the soul life like the physical life sustains itself by a continuous flux and repetition of the same workings and movements. As this constant hereditary succession of lives is a prolongation of the one universal principle of life by a continued creation of similar bodies, a mechanical recurrence, so the system of soul rebirth too is a constant prolongation of the principle of the soul life by a continued creation through Karma of similar embodied associations and experiences, a mechanical recurrence. As the cause of all this physical birth and long hereditary continuation is an obscure will to life in Matter, so the cause of continued soul birth is an ignorant desire or will to be in the universal energy of Karma. As the constant wheelings of the universe and the motions of its forces generate individual existences who escape from or end in being by an individual dissolution, so there is this constant wheel of becoming and motion of Karma which forms into individualised soul-lives that must escape from their continuity by a dissolving cessation. An extinction of the embodied consciousness is our apparent material end; for soul too the end is extinction, the blank satisfaction of Nothingness or some ineffable bliss of a superconscient Non-Being. The affirmation of
the mechanical occurrence or recurrence of birth is the essence of this view; but while the bodily life suffers an enforced end and dissolution, the soul life ceases by a willed self-extinction.

The Buddhistic theory adds nothing to the first obvious significance of life except an indefinite prolongation by rebirth which is a burden, not a gain, and the spiritual greatness of the discipline of self-extinction, — the latter, no doubt, a thing of great value. The illusionist solution adds something, but does not differ very greatly in its motive from the Buddhistic. It sets against the futile cosmic repetition an eternity of our own absolute being; from the ignorance which creates the illusory mechanism of a recurrence of rebirth, it escapes into the self-knowledge of our ineffable existence. That seems to bring in a positive strain and to give to our being an initial, a supporting and an eventual reality. But the hiatus here is the absence of all true and valid relation between this real being of ours and all our birth and becoming. The last event and end of our births is not represented as any absolute fulfilment of what we are, — that would be a great, fruitful and magnificently positive philosophy, nor as the final affirmation of a progressive self-finding, — that too would give a noble meaning to our existence; it is a turning away from the demand of the universal Spirit, a refusal of all these cosmic ideas, imaginations, aspirations, action and effectuation. The way to find our being given us is an absolute denial of all our becoming. We rise to self by a liberating negation of ourselves, and in the result the Idea in the universe pursues its monstrous and aimless road, but the individual ceases and is blest in the cessation. The motive of this way of thought is the same oppressive sense of an ignorant mechanical cosmic recurrence as in the Buddhistic and the same high impatient passion of escape. There is recognition of a divine source of life, but a non-recognition of any divine meaning in life. And as for rebirth it is reduced in its significance to a constant mechanism of self-deception, and the will not to live is shown us as the last acquisition, the highest good and the one desirable result of living. The satisfaction which Illusionism gives, — for it does give a certain high austere kind of satisfaction to the intellect.
and to one turn of spiritual tendency, — is the pressing to a last point of the obvious antinomy between this great burdensome and tyrannous mechanism, the universe, and the spirit which feels itself of another and a diviner nature, the great relief to a soul passioning for freedom, but compelled to labour on as a spring of the dull machine, of being able to cast away the cosmic burden, and finally the free and bare absoluteness of this spiritual conclusion. But it gives no real, because no fruitful answer to the problem of God and man and the significance of life; it only gets away from them by a skilful evasion and takes away from them all significance, so that any question of the sense and will in all this tremendous labour and throb and seeking loses meaning. But the challenge of God’s universe to the knowledge and strength of the human spirit cannot in the end be met by man with a refusal or solved by an evasion, even though an individual soul may take refuge from the demand, as a man may from the burden of action and pain in unconsciousness, in spiritual trance or sleep or escape through its blank doors into the Absolute. Something the Spirit of the universe means by our labour in existence, some sense it has in these grandiose rhythms, and it has not undertaken them in an eternally enduring error or made them in a jest. To know that and possess it, to find and fulfil consciously the universal being’s hidden significances is the task given to the human spirit.

There are other statements or colourings of the idea of rebirth which admit a more positive sense for existence and nourish a robuster confidence in the power and delight of being which are its secret fountains; but they all stumble in the end over the limitations of humanity and an inability to see any outlet from their bondage in the order of the universe, because they suppose this to be a thing fixed from of years sempiternal — śāvatibhyah samābhyah, not an eternally developing and creative, but an immutable cycle. The Vaishnava idea of the play of God, striking as it does into the secret of the hidden delight

1 The magnificent and pregnant phrase of the Koran, “Thinkest thou that I have made the heavens and the earth and all that is between them in a jest?”
at the core of things, is a luminous ray shot into the very heart of the mystery; but isolated it cannot solve all its enigma. There is more here in the world than a play of secret delight; there is knowledge, there is power, there is a will and a mighty labour. Rebirth so looked at becomes too much of a divine caprice with no object but its playing, and ours is too great and strenuous a world to be so accounted for. Such chequered delight as is given to our becoming, is a game of disguises and seekings with no promise here of any divine completeness; its circles seem in the end not worth following out and the soul turns gladly to its release from the game’s unsatisfying mazes. The Tantric solution shows us a supreme superconscient Energy which casts itself out here into teeming worlds and multitudinous beings and in its order the soul rises from birth to birth and follows its million forms, till in a last human series it opens to the consciousness and powers of its own divinity and returns through them by a rapid illumination to the eternal superconscience. We find at last the commencement of a satisfying synthesis, some justification of existence, a meaningful consequence in rebirth, a use and a sufficient though only temporary significance for the great motion of the cosmos. On lines very like these the modern mind, when it is disposed to accept rebirth, is inclined to view it. But there is a too minor stress on the soul’s divine potentialities, a haste of insistence on the escape into superconscience; the supreme Energy constructs too long and stupendous a preparation for so brief and so insufficient a flowering. There is a lacuna here, some secret is still missing.

There are certain limitations of our own thought over which all these solutions stumble, and the chief of these obstacles are our sense of the mechanical nature of the universe and our inability to see forward to a greater than our present type of humanity. We see the superconscient Spirit in its effulgence and freedom and we see the universe in its inconscient bondage to the cycle of its mechanical recurrences, or we see existence as an abstract entity and Nature as a mechanical force; the conscient soul stands between as a link between these opposites, but it is itself so incomplete that we cannot find in this link
the secret or make of it a strong master of reconciliation. Then we pronounce birth to be an error of the soul and see our one chance of liberation in a shaking off of these natal shackles and a violent reversion to supracosmic consciousness or the freedom of abstract being. But what if rebirth were in truth no long dragging chain, but rather at first a ladder of the soul’s ascension and at last a succession of mighty spiritual opportunities? It will be so if the infinite existence is not what it seems to the logical intellect, an abstract entity, but what it is to intuition and in deeper soul experience, a conscious spiritual Reality, and that Reality as real here as in any far off absolute Superconscience. For then universal Nature would be no longer a mechanism with no secret but its own inconscient mechanics and no intention but the mere recurrent working; it would be the conscient energy of the universal Spirit hidden in the greatness of its processes, māhmānam asya. And the soul ascending from the sleep of matter through plant and animal life to the human degree of the power of life and there battling with ignorance and limit to take possession of its royal and infinite kingdom would be the mediator appointed to unfold in Nature the spirit who is hidden in her subtleties and her vastnesses. That is the significance of life and the world which the idea of evolutionary rebirth opens to us; life becomes at once a progressive ascending series for the unfolding of the Spirit. It acquires a supreme significance: the way of the Spirit in its power is justified, no longer a foolish and empty dream, an eternal delirium, great mechanical toil or termless futility, but the sum of works of a large spiritual Will and Wisdom: the human soul and the cosmic spirit look into each other’s eyes with a noble and divine meaning.

The questions which surround our existence elucidate themselves at once with a certain satisfactory fullness. What we are is a soul of the transcendent Spirit and Self unfolding itself in the cosmos in a constant evolutionary embodiment of which the physical side is only a pedestal of form corresponding in its evolution to the ascending degrees of the spirit, but the spiritual growth is the real sense and motive. What is behind us is the past terms of the spiritual evolution, the upward gradations of
the spirit already climbed, by which through constant rebirth we have developed what we are, and are still developing this present and middle human term of the ascension. What is around us is the constant process of the unfolding in its universal aspect: the past terms are there contained in it, fulfilled, overpassed by us, but in general and various type still repeated as a support and background; the present terms are there not as an unprofitable recurrence, but in active pregnant gestation of all that is yet to be unfolded by the spirit, no irrational decimal recurrence helplessly repeating for ever its figures, but an expanding series of powers of the Infinite. What is in front of us is the greater potentialities, the steps yet unclimbed, the intended mightier manifestations. Why we are here is to be this means of the spirit’s upward self-unfolding. What we have to do with ourselves and our significances is to grow and open them to greater significances of divine being, divine consciousness, divine power, divine delight and multiplied unity, and what we have to do with our environment is to use it consciously for increasing spiritual purposes and make it more and more a mould for the ideal unfolding of the perfect nature and self-conception of the Divine in the cosmos. This is surely the Will in things which moves, great and deliberate, unlasting, unresting, through whatever cycles, towards a greater and greater informing of its own finite figures with its own infinite Reality.

All this is to the mind that lives in the figures of the present, as it must be to the careful sceptical mind of positive inquiry, no more than a hypothesis; for if evolution is an acknowledged idea, rebirth itself is only a supposition. Take it so, but still it is a better hypothesis than the naive and childlike religious solutions which make the world an arbitrary caprice and man the breathing clay puppet of an allmighty human-minded Creator, and at least as good a hypothesis as the idea of a material inconscient Force somehow stumbling into a precarious, ephemeral, yet always continued phenomenon of consciousness, or a creative Life labouring in the Bergsonian formula oppressed but constant in the midst of a universal death, as good too as the idea of a mechanical working of Prakriti, Maya, Shakti into which or in
which a real or unreal individual stumbles and wanders, *dan-dramyamāṇo anhena niyamāṇo yathāndhāḥ*, until he can get out of it by a spiritual liberation. To a large philosophical questioning it will not seem in disagreement with the known lines of existence or out of tune with the facts and necessities of being or the demands of reason and intuition, even though it admits a yet unrealised factor, things yet to be; for that is implied in the very idea of evolution. It may modify, but does not radically contradict any religious experience or aspiration, — for it is not inconsistent either with a union with Superconscience or bliss in heavens beyond or any personal or impersonal relation with the Divine, since these may well be heights of the spiritual unfolding. Its truth will depend on spiritual experience and effectuation; but chiefly on this momentous issue, whether there is anything in the soul-powers of man which promises a greater term of being than his present mentality and whether that greater term can be made effective for his embodied existence. That is the question which remains over to be tested by psychological inquiry and the problem to be resolved in the course of the spiritual evolution of man.

There are transcendental questions of the metaphysical necessity, possibility, final reality of an evolutionary manifestation of this kind, but they do not need to be brought in now and here; for the time we are concerned only with its reality to experience and with the processional significance of rebirth, with the patent fact that we are a part of some kind of manifestation and move forward in the press of some kind of evolution. We see a Power at work and seek whether in that power there is a conscious Will, an ordered development and have first to discover whether it is the blind result of an organised Chance or inconscient self-compelled Law or the plan of a universal Intelligence or Wisdom. Once we find that there is a conscious Spirit of which this movement is one expression, or even admit that as our working hypothesis, we are bound to go on and ask whether this developing order ceases with what man now is or is laden

2 “Beating about like the blind led by the blind.”
with something more towards which it and he have to grow, an unfinished expression, a greater unfound term, and in that case it is evidently towards that greater thing that man must be growing; to prepare it and to realise it must be the stage beyond in his destiny. Towards that new step in the evolution his history as a race must be subconsciently tending and the powers of the highest individuals half consciently striving to be delivered of this greater birth; and since the ascending order of rebirth follows always the degrees of the evolution, that too cannot be meant to stop short or shoot off abruptly into the superconscient without any regard to the intended step. The relation of our birth to life on other levels of consciousness and to whatever transcendent Superconscience there may be, are important problems, but their solution must be something in harmony with the intention of the Spirit in the universe; all must be part of a unity, and not an imbroglio of spiritual incoherences and contradictions. Our first bridge from the known to the unknown on this line of thought must be to discover how far the yet unfinished ladder of evolution can mount in the earth series. The whole processional significance of rebirth may be wrapped up in that one yet unattempted discovery.
The Ascending Unity

The human mind loves a clear simplicity of view; the more trenchant a statement, the more violently it is caught by it and inclined to acceptance. This is not only natural to our first crudity of thinking, and the more attractive because it makes things delightfully easy to handle and saves an immense amount of worry of enquiry and labour of reflection, but, modified, it accompanies us to the higher levels of a more watchful mentality. Alexander’s method with the fateful knot is our natural and favourite dealing with the tangled web of things, the easy cut, the royal way, the facile philosophy of this and not this, that and not that, a strong yes and no, a simple division, a pair of robust opposites, a clean cut of classification. Our reason acts by divisions, even our ordinary illogical thought is a stumbling and bungling summary analysis and arrangement of the experience that offers itself to us with such unending complexity. But the cleanest and clearest division is that which sets us most at ease, because it impresses on our still childlike intelligence a sense of conclusive and luminous simplicity.

But the average mind enamoured of a straight and plain thinking, for which, for a famous instance, that great doctor Johnson thought with the royal force dear to all strong men when he destroyed Berkeley’s whole philosophy by simply kicking a stone and saying “There I prove the reality of matter,” is not alone affected by this turn towards simple solutions. Even the philosopher, though he inclines to an intricate reasoning by the way, is best delighted when he can get by it to some magnificently conclusive conclusion, some clean-cutting distinction between Brahman and non-Brahman, Reality and unreality or any of the host of mental oppositions on which so many “isms” have been founded. These royal roads of philosophy have the advantage that they are highly and grandly cut for the steps of
the metaphysical intellect and at the same time attract and over-
power the ordinary mind by the grandiose eminence of the peak
in which they end, some snow-white heaven-cutting Matterhorn
of sovereign formula. What a magnificent exterminating sweep
do we hear for instance in that old renowned sentence, *brahma 
satyam jagan mithyā*, the Eternal alone is true, the universe is a
lie, and how these four victorious words seem to settle the whole
business of God and man and world and life at once and for ever
in their uncompromising antithesis of affirmation and negation.
But after all perhaps when we come to think more at large about
the matter, we may find that Nature and Existence are not of
the same mind as man in this respect, that there is here a great
complexity which we must follow with patience and that those
ways of thinking have most chance of a fruitful truth-yielding,
which like the inspired thinking of the Upanishads take in many
sides at once and reconcile many conflicting conclusions. One
can hew material for a hundred philosophies out of the Upa-
nishads as if from some bottomless Titans’ quarry and yet no
more exhaust it than one can exhaust the opulent bosom of our
mother Earth or the riches of our father Ether.

Man began this familiar process of simple cuttings by em-
phasising his sense of himself as man; he made of himself a being
separate, unique and peculiar in this world, for whom or round
whom everything else was supposed to be created, — and all the
rest, the subhuman existence, animal, plant, inanimate object,
everything to the original atom seemed to him a creation differ-
ent from himself, separate, of another nature; he condemned all
to be without a soul, he was the one ensouled being. He saw
life, defined it by certain characters that struck his mind, and
set apart all other existence as non-living, inanimate. He looked
at his earth, made it the centre of the universe, because the
one inhabited scene of embodied souls or living beings; but the
innumerable other heavenly bodies were only lights to illumine
earth’s day or to relieve her night. He perceived the insufficiency
of this one earthly life only to create another opposite definition
of a perfect heavenly existence and set it in the skies he saw
above him. He perceived his “I” or self and conceived of it as a
separate embodied ego, the centre of all his earthly and heavenly interests, and cut off all other being as the not-I which was there for him to make the best use he could out of it for this little absorbing entity. When he looked beyond these natural sense-governed divisions, he still followed the same logical policy. Conceiving of spirit, he cut it off sharply as a thing by itself, the opposite of all that was not spirit; an antinomy between spirit and matter became the base of his self-conception, or else more amply between spirit on the one side and on the other mind, life and body. Then conceiving of self as a pure entity, all else being not-self was separated from it as of quite another character. Incidentally, with the eye of his inveterate dividing mind, he saw it as his own separate self and, just as before he had made the satisfaction of ego his whole business on earth, so he made the soul’s own individual salvation its one all-important spiritual and heavenly transaction. Or he saw the universal and denied the reality of the individual, refusing to them any living unity or coexistent reality, or saw a transcendent Absolute separate from individual and universe so that these became a figment of the unreal, Asat. Being and Becoming are to his clean-cutting confidently trenchant mind two opposite categories, of which one or the other must be denied, or made a temporary construction or a sum, or sicklied over with the pale hue of illusion, and not Becoming accepted as an eternal display of Being. These conceptions of the sense-guided or the intellectual reason still pursue us, but a considering wisdom comes more and more to perceive that conclusive and satisfying as they may seem and helpful though they may be for action of life, action of mind, action of spirit, they are yet, as we now put them, constructions. There is a truth behind them, but a truth which does not really permit of these isolations. Our classifications set up too rigid walls; all borders are borders only and not impassable gulfs. The one infinitely variable Spirit in things carries over all of himself into each form of his omnipresence; the self, the Being is at once unique in each, common in our collectivities and one in all beings. God moves in many ways at once in his own indivisible unity.
The conception of man as a separate and quite peculiar being in the universe has been rudely shaken down by a patient and disinterested examination of the process of nature. He is without equal or peer and occupies a privileged position on earth, but is not solitary in his being; all the evolution is there to explain this seeker of spiritual greatness embodied in a fragile body and narrow life and bounded mind who in turn by his being and seeking explains to itself the evolution. The animal prepares and imperfectly prefigures man and is itself prepared in the plant, as that too is foreseen obscurely by all that precedes it in the terrestrial expansion. Man himself takes up the miraculous play of the electron and atom, draws up through the complex development of the protoplasm the chemical life of subvital things, perfects the original nervous system of the plant in the physiology of the completed animal being, consummates and repeats rapidly in his embryonic growth the past evolution of the animal form into the human perfection and, once born, rears himself from the earthward and downward animal proneness to the erect figure of the spirit who is already looking up to his farther heavenward evolution. All the terrestrial past of the world is there summarised in man, and not only has Nature given as it were the physical sign that she has formed in him an epitome of her universal forces, but psychologically also he is one in his subconscient being with her obscurer subanimal life, contains in his mind and nature the animal and rises out of all this substratum into his conscious manhood.

Whatever soul there is in man is not a separate spiritual being which has no connection with all the rest of the terrestrial family, but seems to have grown out of it by a taking up of it all and an exceeding of its sense by a new power and meaning of the spirit. This is the universal nature of the type man on earth, and it is reasonable to suppose that whatever has been the past history of the individual soul, it must have followed the course of the universal nature and evolution. The separative pride which would break up the unity of Nature in order to make of ourselves another as well as a greater creation, has no physical warrant, but has been found on the contrary to be contradicted by all
the evidence; and there is no reason to suppose that it has any spiritual justification. The physical history of humankind is the growth out of the subvital and the animal life into the greater power of manhood; our inner history as indicated by our present nature, which is the animal plus something that exceeds it, must have been a simultaneous and companion growing on the same curve into the soul of humanity. The ancient Indian idea which refused to separate nature of man from the universal Nature or self of man from the one common self, accepted this consequence of its seeing. Thus the Tantra assigns eighty millions of plant and animal lives as the sum of the preparation for a human birth and, without binding ourselves to the figure, we can appreciate the force of its idea of the difficult soul evolution by which humanity has come or perhaps constantly comes into being. We can only get away from this necessity of an animal past by denying all soul to subhuman nature.

But this denial is only one of the blind, hasty and presumptuous isolations of the human mind which shut up in its own prison of separate self-perception refuses to see its kinship with the rest of natural being. Because soul or spirit works in the animal on a lower scale, we are not warranted in thinking that there is no soul in him, any more than a divine or superhuman being would be justified in regarding us as soulless bodies or soulless minds because of the grovelling downward drawn inferiority of our half-animal nature. The figure which we use when sometimes we say of one of our own kind that he has no soul, is only a figure; it means only that the animal type of soul predominates in him over the more developed soul type which we expect in the finer spiritual figure of humanity. But this animal element is present in every mother's son of us; it is our legacy, our inheritance from the common earth-mother: and how spiritually do we get this element of our being or incur the burden of this inheritance, if it is not the earning of our own past, the power we have kept from a bygone formative experience? The spiritual law of Karma is that the nature of each being can be only the result of his past energies; to suppose a soul which assumes and continues a past karma that is not its
own, is to cut a line of dissociation across this law and bring in an unknown and unverified factor. But if we admit it, we must account for that factor, we must explain or discover by what law, by what connection, by what necessity, by what strange impulsion of choice a spirit pure of all animal nature assumes a body and nature of animality prepared for it by a lower order of being. If there is no affinity and no consequence of past identity or connection, this becomes an unnatural and impossible assumption. Then it is the most reasonable and concordant conclusion that man has the animal nature,—and indeed if we consider well his psychology, we find that he houses many kinds of animal souls or rather an amalgam of animal natures,—because the developing self in him like the developed body has had a past subhuman evolution. This conclusion preserves the unity of Nature and its developing order; and it concurs with the persistent evidence of an interaction and parallelism which we perceive between the inward and the outward, the physical and the mental phenomenon,—a correspondence and companionship which some would explain by making mind a result and notation of the act of nerve and body, but which can now be better accounted for by seeing in vital and physical phenomenon a consequence and minor notation of a soul-action which it at the same time hints and conceals from our sense-bound mentality. Finally, it makes of soul or spirit, no longer a miraculous accident or intervention in a material universe, but a constant presence in it and the secret of its order and its existence.

The concession of an animal soul existence and of its past subhuman births slowly and guardedly preparing the birth into humanity cannot stop short at this abrupt line in the natural gradation. For man epitomises in his being not only the animal existence below him, but the obscurer subanimal being. But if it is difficult for us to concede a soul to the despised animal form and mind, it is still more difficult to concede it to the brute subconscience of the subanimal nature. Ancient belief made this concession with the happiest ease, saw a soul, a living godhead everywhere in the animate and in the inanimate and nothing was
to its view void of a spiritual existence. The logical abstracting intellect with its passion for clean sections intermediately swept away these large beliefs as an imaginative superstition or a primitive animism and, mastered by its limiting and dividing definitions, it drove a trenchant sectional cleavage between man and animal, animal and plant, animate and inanimate being. But now to the eye of our enlarging reason this system of intolerant cleavages is in rapid course of disappearance. The human mind is a development from what is inchoate in the animal mentality; there is, even, in that inferior type a sort of suppressed reason, for that name may well be given to a power of instinctive and customary conclusion from experience, association, memory and nervous response, and man himself begins with these things though he develops out of this animal inheritance a free human self-detaching power of reflective will and intelligence. And it is now clear that the nervous life which is the basis of that physical mentality in man and animal, exists also in the plant with a fundamental identity; not only so, but it is akin to us by a sort of nervous psychology which amounts to the existence of a suppressed mind. A subconscient mind in the plant, it is now not unreasonable to suggest, — but is it not at the summits of plant experience only half subconscious? — becomes conscient in the animal body. When we go lower down, we find hints that there are involved in the subvital most brute material forms the rudiments of precisely the same energy of life and its responses.

And the question then arises whether there is not an unbroken continuity in Nature, no scissions and sections, no unbridgeable gulfs or impassable borders, but a complete unity, matter instinct with a suppressed life, life instinct with a suppressed mind, mind instinct with a suppressed energy of a diviner intelligence, each new form or type of birth evolving a stage in the succession of suppressed powers, and there too the evolution not at an end, but this large and packed intelligence the means of liberating a greater and now suppressed self-power of the Spirit. A spiritual evolution thus meets our eye in the world which an inner force raises up a certain scale of gradations of its births in form by the unfolding of its own hidden powers to
the greatness of its complete and highest reality. The word of the ancient Veda stands,—out of all the ocean of inconscience, apraketaṁ salītaṁ sarvam idam, it is that one spiritual Existent who is born by the greatness of his own energy, tapasas tan mabinā ajāyata ekam. Where in this evolution does the thing we call soul make its first appearance? One is obliged to ask, was it not there, must it not have been there from the first beginnings, even though asleep or, as we may say, somnambulist in matter? If man were only a superior animal with a greater range of physical mind, we might conceivably say that there was no soul or spirit, but only three successive powers of Energy in a series of the forms of matter. But in this human intelligence there does appear at its summit a greater power of spirit; we rise up to a consciousness which is not limited by its physical means and formulas. This highest thing is not, as it might first appear, an unsubstantial sublimation of mind and mind a subtle sublimation of living matter. This greatness turns out to have been the very self-existent substance and power of our being; all other things seem in comparison only its lesser forms of itself which it uses for a progressive revelation; spirit in the end proves itself the first and not only the last, Alpha as well as Omega, and the whole secret of existence from its beginning. We come to a fathomless conception of this all, sarvam idam, in which we see that there is an obscure omnipresent life in matter, activised by that life a secret sleeping mind, sheltered in that sleep of mind an involved all-knowing all-originating Spirit. But then soul is not to be conceived of as a growth or birth of which we can fix a date of its coming or a stage in the evolution which brings it to a first capacity of formation, but rather all here is assumption of form by a secret soul which becomes in the self-seeking of life increasingly manifest to a growing self-consciousness. All assumption of form is a constant and yet progressive birth or becoming of the soul, sambhava, sambhūti,—the dumb and blind and brute is that and not only the finely, mentally conscious human or the animal existence. All this infinite becoming is a birth of the Spirit into form. This is the truth, obscure at first or vague to the intelligence, but very
The Ascending Unity

luminous to an inner experience, on which the ancient Indian idea of rebirth took its station.

But the repeated birth of the same individual does not at first sight seem to be indispensable in this overpowering universal unity. To the logical intellect it might appear to be a contradiction, since all here is the one self, spirit, existence born into nature, assuming a multitude of forms, ascending many gradations of its stages of self-revelation. That summary cutting of existence into the I and the not-I which was the convenience of our egoistic notion of things, a turn of mind so powerful for action, would seem to be only a practical or a mechanical device of the one Spirit to support its separative phenomenon of birth and conscious variation of combined proceeding, a sorcerer’s trick of the universal intelligence; it is only apparent fact of being, not its truth,—there is no separation, only a universal unity, one spirit. But may not this again be a swinging away to the opposite extreme? As the ego was an excessive scission in the unity of being, so this idea of an ocean of unity in which our life would be only an inconstant momentary wave, may be a violent excision of something indispensable to the universal order. Individuality is as important a thing to the ways of the Spirit of existence as universality. The individual is that potent secret of its being upon which the universal stresses and leans and makes the knot of power of all its workings: as the individual grows in consciousness and sight and knowledge and all divine power and quality, increasingly he becomes aware of the universal in himself, but aware of himself too in the universality, of his own past not begun and ended in the single transient body, but opening to future consummations. If the aim of the universal in our birth is to become self-conscious and possess and enjoy its being, still it is done through the individual’s flowering and perfection; if to escape from its own workings be the last end, still it is the individual that escapes while the universal seems content to continue its multitudinous births to all eternity. Therefore the individual would appear to be a real power of the Spirit and not a simple illusion or device, except in so far as the universal too may be, as some would have it, an immense illusion or
The Problem of Rebirth

a grand imposed device. On this line of thinking we arrive at the idea of some great spiritual existence of which universal and individual are two companion powers, pole and pole of its manifestation, indefinite circumference and multiple centre of the activised realities of its being.

This is a way of seeing things, harmonious at least in its complexity, supple and capable of a certain all-embracing scope, which we can take as a basis for our ideas of rebirth,—an ascending unity, a spirit involved in material existence which scales wonderfully up many gradations through life to organised mind and beyond mind to the evolution of its own complete self-conscience, the individual following that gradation and the power for its self-crowning. If human mind is the last word of its possibility on earth, then rebirth must end in man and proceed by some abrupt ceasing either to an existence on other planes or to an annulment of its spiritual circle. But if there are higher powers of the spirit which are attainable by birth, then the ascent is not finished, greater assumptions may lie before the soul which has now reached and is lifted to a perfecting of the high scale of humanity. It may even be that this ascending rebirth is not the long upward rocket shooting of a conscious being out of matter or its whirling motion in mind destined to break up and dissolve in some high air of calm nothingness or of silent timeless infinity, but a progress to some great act and high display of the Divinity which shall give a wise and glorious significance to his persistent intention in an eternal creation. Or that at least may be one power of the Eternal’s infinite potentiality.
The Western idea of evolution is the statement of a process of formation, not an explanation of our being. Limited to the physical and biological data of Nature, it does not attempt except in a summary or a superficial fashion to discover its own meaning, but is content to announce itself as the general law of a quite mysterious and inexplicable energy. Evolution becomes a problem in motion which is satisfied to work up with an automatic regularity its own puzzle, but not to work it out, because, since it is only a process, it has no understanding of itself, and, since it is a blind perpetual automatism of mechanical energy, it has neither an origin nor an issue. It began perhaps or is always beginning; it will stop perhaps in time or is always somewhere stopping and going back to its beginnings, but there is no why, only a great turmoil and fuss of a how to its beginning and its cessation; for there is in its acts no fountain of spiritual intention, but only the force of an unresting material necessity. The ancient idea of evolution was the fruit of a philosophical intuition, the modern is an effort of scientific observation. Each as enounced misses something, but the ancient got at the spirit of the movement where the modern is content with a form and the most external machinery. The Sankhya thinker gave us the psychological elements of the total evolutionary process, analysed mind and sense and the subtle basis of matter and divined some of the secrets of the executive energy, but had no eye for the detail of the physical labour of Nature. He saw in it too not only the covering active evident Force, but the concealed sustaining spiritual entity, though by an excess of the analytic intellect, obsessed with its love of trenchant scissions and symmetrical oppositions, he set between meeting Soul and Force an original and eternal gulf or line of separation. The modern scientist strives to make a complete scheme and
institution of the physical method which he has detected in its minute workings, but is blind to the miracle each step involves or content to lose the sense of it in the satisfied observation of a vast ordered phenomenon. But always the marvel of the thing remains, one with the inexplicable wonder of all existence,—even as it is said in the ancient Scripture,

\[
\text{āścaryavat āsasyati kaścid enam,}
\text{āścaryavad vadati tathaiva cányaḥ;}
\text{āścaryavac cainam anyah śṛṇoti,}
\text{śrūvāpyenaṁ veda na caiva kaścit.}
\]

“One looks on it and sees a miracle, another speaks of it as a miracle, as a miracle another hears of it, but what it is, for all the hearing, none knoweth.” We know that an evolution there is, but not what evolution is; that remains still one of the initial mysteries of Nature.

For evolution, as is the habit with the human reason’s accounts and solutions of the deep and unfathomable way of the spirit in things, raises more questions than it solves; it does not do away with the problem of creation, for all its appearance of solid orderly fact, any more than the religious affirmation of an external omnipotent Creator could do it or the illusionist’s mystic Maya, aghat.ana-ghat.ana-pat.ÅõyasÅõ, very skilful in bringing about the impossible, some strange existent non-existent Power with an idea in That which is beyond and without ideas, self-empowered to create an existent non-existent world, existent because it very evidently is, non-existent because it is a patched up consistency of dreamful unreal transiences. The problem is only prolonged, put farther back, given a subtle and orderly, but all the more challengingly complex appearance. But, even when our questioning is confined to the one issue of evolution alone, the difficulty still arises of the essential significance of the bare outward facts observed, what is meant by evolution, what is it that evolves, from what and by what force of necessity? The scientist is content to affirm an original matter or substance, atomic, electric, etheric or whatever it may finally turn out to be, which by the very nature of its own inherent energy or of an
energy acting in it and on it, — the two things are not the same, and the distinction, though it may seem immaterial in the beginning of the process, is of a considerable ultimate consequence, — produces owing to some unexplained law, constant system of results or other unalterable principle a number of different basic forms and powers of matter or different sensible and effective movements of energy: these come into being, it seems, when the minute original particles of matter meet together in variously disposed quantities, measures and combinations, and all the rest is a varying, developing, mounting movement of organised energy and its evolutionary consequences, parināma, which depends on this crude constituting basis. All that is or may be a correct statement of phenomenal fact, — but we must not forget that the fundamental theory of science has been going of late through a considerable commotion of an upsetting and a rapid rearrangement, — but it carries us no step farther towards the principal, the all-important thing that we want to know. The way in which man sees and experiences the universe, imposes on his reason the necessity of a one original eternal substance of which all things are the forms and a one eternal original energy of which all movement of action and consequence is the variation. But the whole question is what is the reality of this substance and what is the essential nature of this energy?

Then, even if we suppose the least explicable part of the action to be an evolutionary development of the immaterial from Matter, still is that development a creation or a liberation, a birth of what did not exist before or a slow bringing out of what already existed in suppressed fact or in eternal potentiality? And the interest of the question becomes acute, its importance incalculable when we come to the still unexplained phenomenon of life and mind. Is life a creation out of inanimate substance or the appearance of a new, a suddenly or slowly resultant power out of the brute material energy, and is conscious mind a creation out of inconscient or subconscient life, or do these powers and godheads appear because they were always there though in a shrouded and by us unrecognizable condition of their hidden or suppressed idea and activity, Nomen and Numen? And what
of the soul and of man? Is soul a new result or creation of our mentalised life, — even so many regard it, because it clearly appears as a self-conscious, bright, distinguishable power only when thinking life has reached some high pitch of its intensity, — or is it not a permanent entity, the original mystery that now unveils its hidden form, the eternal companion of the energy we call Nature, her secret inhabitant or her very spirit and reality? And is man a biological creation of a brute energy which has somehow unexpectedly and quite inexplicably managed to begin to feel and think, or is he in his real self that inner Being and Power which is the whole sense of the evolution and the master of Nature? Is Nature only the force of self-expression, self-formation, self-creation of a secret spirit, and man however hedged in his present capacity, the first being in Nature in whom that power begins to be consciently self-creative in the front of the action, in this outer chamber of physical being, there set to work and bring out by an increasingly self-conscious evolution what he can of all its human significance or its divine possibility? That is the clear conclusion we must arrive at in the end, if we once admit as the key of the whole movement, the reality of this whole mounting creation a spiritual evolution.

The word evolution carries with it in its intrinsic sense, in the idea at its root the necessity of a previous involution. We must, if a hidden spiritual being is the secret of all the action of Nature, give its full power to that latent value of the idea. We are bound then to suppose that all that evolves already existed involved, passive or otherwise active, but in either case concealed from us in the shell of material Nature. The Spirit which manifests itself here in a body, must be involved from the beginning in the whole of matter and in every knot, formation and particle of matter; life, mind and whatever is above mind must be latent inactive or concealed active powers in all the operations of material energy. The only alternative would be to drive in between the two sides of our being the acute Sankhya scission; but that divides too much spirit and nature. Nature would be an inert and mechanical thing, but she would set to her work activised by some pressure on her of the Spirit. Spirit would be Being conscious
and free in its own essence from the natural activity, but would phenomenally modify or appear to modify its consciousness in response to some reaction of Nature. One would reflect the movements of the active Power, the other would enlighten her activities with the consciousness of the self-aware immortal being. In that case the scientific evolutionary view of Nature as a vast mechanical energy, life, mind and natural soul action its scale of developing operations would have a justification. Our consciousness would only be a luminous translation of the self-driven unresting mechanical activity into responsive notes of experience of the consenting spiritual witness. But the disabling difficulty in this notion is the quite opposite character of our own highest seeing; for in the end and as the energy of the universal force mounts up the gradients of its own possibilities, Nature becomes always more evidently a power of the spirit and all her mechanism only figures of its devising mastery. The power of the Flame cannot be divided from the Flame; where the Flame is, there is the power, and where the power is there is the fiery Principle. We have to come back to the idea of a spirit present in the universe and, if the process of its works of power and its appearance is in the steps of an evolution, there imposes itself the necessity of a previous involution.

This spirit in things is not apparent from the beginning, but self-betrayed in an increasing light of manifestation. We see the compressed powers of Nature start released from their original involution, disclose in a passion of work the secrets of their infinite capacity, press upon themselves and on the supporting inferior principle to subject its lower movement on which they are forced to depend into a higher working proper to their own type and feel their proper greatness in the greatness of their self-revealing effectuations. Life takes hold of matter and breathes into it the numberless figures of its abundant creative force, its subtle and variable patterns, its enthusiasm of birth and death and growth and act and response, its will of more and more complex organisation of experience, its quivering search and feeling out after a self-consciousness of its own pleasure and pain and understanding gust of action; mind seizes on life to make
it an instrument for the wonders of will and intelligence; soul possesses and lifts mind through the attraction of beauty and good and wisdom and greatness towards the joy of some half-seen ideal highest existence; and in all this miraculous movement and these climbing greatnesses each step sets its foot on a higher rung and opens to a clearer, larger and fuller scope and view of the always secret and always self-manifesting spirit in things. The eye fixed on the physical evolution has only the sight of a mechanical grandeur and subtlety of creation; the evolution of life opening to mind, the evolution of mind opening to the soul of its own light and action, the evolution of soul out of the limited powers of mind to a resplendent blaze of the infinities of spiritual being are the more significant things, give us greater and subtler reaches of the self-disclosing Secrecy. The physical evolution is only an outward sign, the more and more complex and subtle development of a supporting structure, the growing exterior metre mould of form which is devised to sustain in matter the rising intonations of the spiritual harmony. The spiritual significance finds us as the notes rise; but not till we get to the summit of the scale can we command the integral meaning of that for which all these first formal measures were made the outward lines, the sketch or the crude notation. Life itself is only a coloured vehicle, physical birth a convenience for the greater and greater births of the Spirit.

The spiritual process of evolution is then in some sense a creation, but a self-creation, not a making of what never was, but a bringing out of what was implicit in the Being. The Sanskrit word for creation signifies a loosing forth, a letting out into the workings of Nature. The Upanishad in a telling figure applies the image of the spider which brings its web out of itself and creates the structure in which it takes its station. That is applied in the ancient Scripture not to the evolution of things out of Matter, but to an original bringing of temporal becoming out of the eternal infinity; Matter itself and this material universe are only such a web or indeed no more than a part of it brought out from the spiritual being of the Infinite. But the same truth, the same law holds good of all that we see of the emergence of things from
involution in the material energy. We might almost speak here of a double evolution. A Force inherent in the Infinite brings out of it eternally the structure of its action in a universe of which the last descending scale is based upon an involution of all the powers of the spirit into an inconscient absorption in her self-oblivious passion of form and structural working. Thence comes an ascent and progressive liberation of power after power till the spirit self-disclosed and set free by knowledge and mastery of its works repossesses the eternal fullness of its being which envelops then and carries in its grasp the manifold and unified splendours of its nature. At any rate the spiritual process of which our human birth is a step and our life is a portion, appears as the bringing out of a greatness, asya mahimānam, which is secret, inherent and self-imprisoned, absorbed in the form and working of things. Our world-action figures an evolution, an outrolling of a manifold Power gathered and coiled up in the crude intricacy of Matter. The upward progress of the successive births of things is a rise into waking and larger and larger light of a consciousness shut into the first hermetic cell of sleep of the eternal Energy.

There is a parallel in the Yogic experience of the Kundalini, eternal Force coiled up in the body in the bottom root vessel or chamber, mulādhāra, pedestal, earth-centre of the physical nervous system. There she slumbers coiled up like a Python and filled full of all that she holds gathered in her being, but when she is struck by the freely coursing breath, by the current of Life which enters in to search for her, she awakes and rises flaming up the ladder of the spinal chord and forces open centre after centre of the involved dynamic secrets of consciousness till at the summit she finds, joins and becomes one with the spirit. Thus she passes from an involution in inconscience through a series of opening glories of her powers into the greatest eternal super-consciousness of the spirit. This mysterious evolving Nature in the world around us follows even such a course. Inconscient being is not so much a matrix as a chamber of materialised energy in which are gathered up all the powers of the spirit; they are there, but work in the conditions of the material energy, involved, we say, and therefore not apparent as themselves because they have
passed into a form of working subnormal to their own right scale where the characteristics by which we recognise and think we know them are suppressed into a minor and an undetected force of working. As Nature rises in the scale, she liberates them into their recognisable scales of energy, discloses the operations by which they can feel themselves and their greatness. At the highest summit she rises into the self-knowledge of the spirit which informed her action, but because of its involution or concealment in the forms of its workings could not be known in the greatness of its reality. Spirit and Nature discovering the secret of her energies become one at the top of the spiritual evolution by a soul in Nature which awakens to the significance of its own being in the liberation of the highest truth: it comes to know that its births were the births, the assumptions of form of an eternal Spirit, to know itself as that and not a creature of Nature and rises to the possession of the revealed, full and highest power of its own real and spiritual nature. That liberation, because liberation is self-possession, comes to us as the crown of a spiritual evolution.

We must consider all the packed significance of this involution. The spirit involved in material energy is there with all its powers; life, mind and a greater supramental power are involved in Matter. But what do we mean when we say that they are involved, and do we mean that all these things are quite different energies cut off from each other by an essential separateness, but rolled up together in an interaction, or do we mean that there is only one Being with its one energy, varying shades of the light of its power differentiated in the spectrum of Nature? When we say that Life is involved in Matter or in material Force, for of that Force Matter seems after all to be only a various self-spun formation, do we not mean that all this universal working, even in what seems to us its inconscient inanimate action, is a life-power of the spirit busy with formation, and we do not recognise it because it is there in a lower scale in which the characteristics by which we recognise life are not evident or are only slightly evolved in the dullness of the material covering? Material energy would be then Life packed into the density of
Matter and feeling out in it for its own intenser recognisable power which it finds within itself in the material concealment and liberates into action. Life itself would be an energy of a secret mind, a mind imprisoned in its own forms and quivering out in the nervous seekings of life for its intenser recognisable power of consciousness which it discovers within the vital and material suppression and liberates into sensibility. No doubt, practically, these powers work upon each other as different energies, but in essence they would be one energy and their interaction the power of the spirit working by its higher on its lower forces, depending on them at first, but yet turning in the scale of its ascent to overtop and master them. Mind too might only be an inferior scale and formulation derived from a much greater and supramental consciousness, and that consciousness too with its greater light and will a characteristic originating power of spiritual being, the power which secret in all things, in mind, in life, in matter, in the plant and the metal and the atom assures constantly by its inevitable action the idea and harmony of the universe. And what is the spirit itself but infinite existence, eternal, immortal being, but always a conscious self-aware being, — and that is the difference between the materialist’s mechanical monism and the spiritual theory of the universe, — which here expresses itself in a world finite to our conceptions whose every movement yet bears witness to the Infinite? And this world is because the spirit has the delight of its own infinite existence and the delight of its own infinite self-variation; birth is because all consciousness carries with it power of its own being and all power of being is self-creative and must have the joy of its self-creation. For creation means nothing else than a self-expression; and the birth of the soul in the body is nothing but a mode of its own self-expression. Therefore all things here are expression, form, energy, action of the Spirit; matter itself is but form of spirit, life but power of being of the spirit, mind but working of consciousness of the spirit. All Nature is a display and a play of God, power and action and self-creation of the one spiritual Being. Nature presents to spirit at once the force, the instrument, the medium, the obstacle, the result of his powers, and all these
things, obstacle as well as instrument, are the necessary elements for a gradual and developing creation.

But if the Spirit has involved its eternal greatness in the material universe and is there evolving its powers by the virtue of a secret self-knowledge, is disclosing them in a grandiose succession under the self-imposed difficulties of a material form of being, is disengaging them from a first veiling absorbed in conscience of Nature, there is no difficulty in thinking or seeing that this soul shaped into humanity is a being of that Being, that this also has risen out of material involution by increasing self-expression in a series of births of which each grade is a new ridge of the ascent opening to higher powers of the spirit and that it is still arising and will not be for ever limited by the present walls of its birth but may, if we will, be born into a divine humanity. Our humanity is the conscious meeting place of the finite and the infinite and to grow more and more towards that Infinite even in this physical birth is our privilege. This Infinite, this Spirit who is housed within us but not bound or shut in by mind or body, is our own self and to find and be our self was, as the ancient sages knew, always the object of our human striving, for it is the object of the whole immense working of Nature. But it is by degrees of the self-finding that Nature enlarges to her spiritual reality. Man himself is a doubly involved being; most of himself in mind and below is involved in a subliminal conscience or a subconscience; most of himself above mind is involved in a spiritual superconscience. When he becomes conscient in the superconscience, the heights and the depths of his being will be illumined by another light of knowledge than the flickering lamp of the reason can now cast into a few corners; for then the master of the field will enlighten this whole wonderful field of his being, as the sun illumines the whole system it has created out of its own glories. Then only he can know the reality even of his own mind and life and body. Mind will be changed into a greater consciousness, his life will be a direct power and action of the Divinity, his very body no longer this first gross lump of breathing clay, but a very image and body of spiritual being. That transfiguration on the summit
of the mountain, divine birth, divya janma, is that to which all these births are a long series of laborious steps. An involution of spirit in matter is the beginning, but a spiritual assumption of divine birth is the fullness of the evolution.

East and West have two ways of looking at life which are opposite sides of one reality. Between the pragmatic truth on which the vital thought of modern Europe enamoured of the vigour of life, all the dance of God in Nature, puts so vehement and exclusive a stress and the eternal immutable Truth to which the Indian mind enamoured of calm and poise loves to turn with an equal passion for an exclusive finding, there is no such divorce and quarrel as is now declared by the partisan mind, the separating reason, the absorbing passion of an exclusive will of realisation. The one eternal immutable Truth is the Spirit and without the spirit the pragmatic truth of a self-creating universe would have no origin or foundation; it would be barren of significance, empty of inner guidance, lost in its end, a firework display shooting up into the void only to fall away and perish in mid-air. But neither is the pragmatic truth a dream of the non-existent, an illusion or a long lapse into some futile delirium of creative imagination; that would be to make the eternal Spirit a drunkard or a dreamer, the fool of his own gigantic self-hallucinations. The truths of universal existence are of two kinds, truths of the spirit which are themselves eternal and immutable, and these are the great things that cast themselves out into becoming and there constantly realise their powers and significances, and the play of the consciousness with them, the discords, the musical variations, soundings of possibility, progressive notations, reversions, perversions, mounting conversions into a greater figure of harmony; and of all these things the spirit has made, makes always his universe. But it is himself that he makes in it, himself that is the creator and the energy of creation and the cause and the method and the result of the working, the mechanist and the machine, the music and the musician, the poet and the poem, supermind, mind and life and matter, the soul and Nature.

An original error pursues us in our solutions of our problem. We are perplexed by the appearance of an antinomy; we set soul
against Nature, the spirit against his creative energy. But Soul and Nature, Purusha and Prakriti, are two eternal lovers who possess their perpetual unity and enjoy their constant difference, and in the unity abound in the passion of the multitudinous play of their difference, and in every step of the difference abound in the secret sense or the overt consciousness of unity. Nature takes the Soul into herself so that he falls asleep in a trance of union with her absorbed passion of creation and she too seems then to be asleep in the whirl of her own creative energy; and that is the involution in Matter. Above, it may be, the Soul takes Nature into himself so that she falls asleep in a trance of oneness with the absorbed self-posssession of the spirit and he too seems to be asleep in the deep of his own self-locked immobile being. But still above and below and around and within all this beat and rhythm is the eternity of the spirit who has thus figured himself in soul and nature and enjoys with a perfect awareness all that he creates in himself by this involution and evolution. The soul fulfils itself in Nature when it possesses in her the consciousness of that eternity and its power and joy and transfigures the natural becoming with the fullness of the spiritual being. The constant self-creation which we call birth finds there the perfect evolution of all that it held in its own nature and reveals its own utmost significance. The complete soul possesses all its self and all Nature.

Therefore all this evolution is a growing of the Self in material nature to the conscious possession of its own spiritual being. It begins with form — apparently a form of Force — in which a spirit is housed and hidden; it ends in a spirit which consciously directs its own force and creates or assumes its own forms for the free joy of its being in Nature. Nature holding her own self and spirit involved and suppressed within herself, an imprisoned master of existence subjected to her ways of birth and action, — yet are these ways his and this spirit the condition of her being and the law of her workings, — commences the evolution: the spirit holding Nature conscious in himself, complete by his completeness, liberated by his liberation, perfected in his perfection, crowns the evolution. All our births are the
births of this spirit and self which has become or put forth a soul in Nature. To be is the object of our existence,—there is no other end or object, for the consciousness and bliss of being is the whole beginning and middle and end, as it is that which is without beginning or end. But this means in the steps of the evolution to grow more and more until we grow into our own fullness of self; all birth is a progressive self-finding, a means of self-realisation. To grow in knowledge, in power, in delight, love and oneness, towards the infinite light, capacity and bliss of spiritual existence, to universalise ourselves till we are one with all being, and to exceed constantly our present limited self till it opens fully to the transcendence in which the universal lives and to base upon it all our becoming, that is the full evolution of what now lies darkly wrapped or works half evolved in Nature.
Karma

One finds an unanswerable truth in the theory of Karma, — not necessarily in the form the ancients gave to it, but in the idea at its centre, — which at once strikes the mind and commands the assent of the understanding. Nor does the austerer reason, distrustful of first impressions and critical of plausible solutions, find after the severest scrutiny that the more superficial understanding, the porter at the gateways of our mentality, has been deceived into admitting a tinsel guest, a false claimant into our mansion of knowledge. There is a solidity at once of philosophic and of practical truth supporting the idea, a bedrock of the deepest universal undeniable verities against which the human mind must always come up in its fathomings of the fathomless; in this way indeed does the world deal with us, there is a law here which does so make itself felt and against which all our egoistic ignorance and self-will and violence dashes up in the end, as the old Greek poet said of the haughty insolence and prosperous pride of man, against the very foundation of the throne of Zeus, the marble feet of Themis, the adamantine bust of Ananke. There is the secret of an eternal factor, the base of the unchanging action of the just and truthful gods, devānām dhruvānī vratānī, in the self-sufficient and impartial law of Karma.

This truth of Karma has been always recognised in the East in one form or else in another; but to the Buddhists belongs the credit of having given to it the clearest and fullest universal enunciation and the most insistent importance. In the West too the idea has constantly recurred, but in external, in fragmentary glimpses, as the recognition of a pragmatic truth of experience, and mostly as an ordered ethical law or fatality set over against the self-will and strength of man: but it was clouded over by other ideas inconsistent with any reign of law, vague ideas of
some superior caprice or of some divine jealousy, — that was a
notion of the Greeks, — a blind Fate or inscrutable Necessity,
Ananke, or, later, the mysterious ways of an arbitrary, though
no doubt an all-wise Providence. And all this meant that there
was some broken half-glimpse of the working of a force, but
the law of its working and the nature of the thing itself escaped
the perception, — as indeed it could hardly fail to do, since the
mental eye of the West, absorbed by the passion of life, tried to
read the workings of the universe in the light of the single mind
and life of man; but those workings are much too vast, ancient,
unbrokenly continuous in Time and all-pervading in Space, —
not in material infinity alone, but in the eternal time and eternal
space of the soul’s infinity, — to be read by so fragmentary a
glimmer. Since the Eastern idea and name of the law of Karma
was made familiar to the modern mentality, one side of it has
received an increasing recognition, perhaps because latterly that
mentality had been prepared by the great discoveries and gener-
alisations of Science for a fuller vision of cosmic existence and
a more ordered and majestic idea of cosmic Law. It may be as
well then to start from the physical base in approaching this
question of Karma, though we may find at last that it is from
the other end of being, from its spiritual summit rather than its
material support that we must look in order to catch its whole
significance — and to fix also the limits of its significance.

Fundamentally, the meaning of Karma is that all existence is
the working of a universal Energy, a process and an action and
a building of things by that action, — an unbuilding too, but as
a step to farther building, — that all is a continuous chain in
which every one link is bound indissolubly to the past infinity of
numberless links, and the whole governed by fixed relations, by a
fixed association of cause and effect, present action the result of
past action as future action will be the result of present action, all
cause a working of energy and all effect too a working of energy.
The moral significance is that all our existence is a putting out of
an energy which is in us and by which we are made and as is the
nature of the energy which is put forth as cause, so shall be that
of the energy which returns as effect, that this is the universal
law and nothing in the world can, being of and in our world, escape from its governing incidence. That is the philosophical reality of the theory of Karma, and that too is the way of seeing which has been developed by physical Science. But its seeing has been handicapped in the progress to the full largeness of its own truth by two persistent errors, first, the strenuous paradoxical attempt — inevitable and useful no doubt as one experiment of the human reason which had to have its opportunity, but foredoomed to failure — to explain supraphysical things by a physical formula, and a darkening second error of setting behind the universal rule of law and as its cause and efficient the quite opposite idea of the cosmic reign of Chance. The old notion of an unintelligible supreme caprice, — unintelligible it must naturally be since it is the working of an unintelligent Force, — thus prolonged its reign and got admission side by side with the scientific vision of the fixities and chained successions of the universe.

Being is no doubt one, and Law too may be one; but it is perilous to fix from the beginning on one type of phenomena with a predetermined will to deduce from that all other phenomenon however different in its significance and nature. In that way we are bound to distort truth into the mould of our own prepossession. Intermediately at least we have rather to recognise the old harmonious truth of Veda — which also came by this way in its end, its Vedanta, to the conception of the unity of Being, — that there are different planes of cosmic existence and therefore too of our own existence and in each of them the same powers, energies or laws must act in a different type and in another sense and light of their effectuality. First, then, we see that if Karma be a universal truth or the universal truth of being, it must be equally true of the inly-born mental and moral worlds of our action as in our outward relations with the physical universe. It is the mental energy that we put forth which determines the mental effect, — but subject to all the impact of past, present and future surrounding circumstance, because we are not isolated powers in the world, but rather our energy a subordinate strain and thread of the universal energy. The moral energy of our action determines similarly the nature and effect of the moral
consequence, but subject too — though to this element the rigid moralist does not give sufficient consideration, — to the same incidence of past, present and future surrounding circumstance. That this is true of the output of physical energy, needs no saying nor any demonstration. We must recognise these different types and variously formulated motions of the one universal Force, and it will not do to say from the beginning that the measure and quality of my inner being is some result of the output of a physical energy translated into mental and moral energies, — for instance, that my doing a good or a bad action or yielding to good or to bad affections and motives is at the mercy of my liver, or contained in the physical germ of my birth, or is the effect of my chemical elements or determined essentially and ultimately by the disposition of the constituent electrons of my brain and nervous system. Whatever drafts my mental and moral being may make on the corporeal for its supporting physical energy and however it may be affected by its borrowings, yet it is very evident that it uses them for other and larger purposes, has a supraphysical method, evolves much greater motives and significances. The moral energy is in itself a distinct power, has its own plane of karma, moves me even, and that characteristically, to override my vital and physical nature. Forms of one universal Force at bottom — or at top — these may be, but in practice they are different energies and have to be so dealt with — until we can find what that universal Force may be in its highest purest texture and initial power and whether that discovery can give us in the perplexities of our nature a unifying direction.

Chance, that vague shadow of an infinite possibility, must be banished from the dictionary of our perceptions; for of chance we can make nothing, because it is nothing. Chance does not at all exist; it is only a word by which we cover and excuse our own ignorance. Science excludes it from the actual process of physical law; everything there is determined by fixed cause and relation. But when it comes to ask why these relations exist and not others, why a particular cause is allied to a particular effect, it finds that it knows nothing whatever about the matter; every actualised possibility supposes a number of other possibilities
that have not actualised but conceivably might have, and it is convenient then to say that Chance or at most a dominant probability determines all actual happening, the chance of evolution, the stumblings of a groping inconscient energy which somehow finds out some good enough way and fixes itself into a repetition of the process. If Inconscience can do the works of intelligence, it may not be impossible that chaotic Chance should create a universe of law! But this is only a reading of our own ignorance into the workings of the universe,—just as prescientific man read into the workings of physical law the caprices of the gods or any other name for a sportive Chance whether undivine or dressed in divine glories, whether credited with a pliant flexibility to the prayers and bribes of man or presented with an immutable Sphinx face of stone,—but names only in fact for his own ignorance.

And especially when we come to the pressing needs of our moral and spiritual being, no theory of chance or probability will serve at all. Here Science, physical in her basis, does not help except to point out to a certain degree the effects of my physicality on my moral being or of my moral action on my physicality: for anything else of just illumination or useful purpose, she stumbles and splashes about in the quagmire of her own nescience. Earthquake and eclipse she can interpret and predict, but not my moral and spiritual becoming, but only attempt to explain its phenomena when they have happened by imposing polysyllables and fearful and wonderful laws of pathology, morbid heredity, eugenics and what not of loose fumbling, which touch only the draggled skirts of the lowest psycho-physical being. But here I need guidance more than anywhere else and must have the recognition of a law, the high line of a guiding order. To know the law of my moral and spiritual being is at first and last more imperative for me than to learn the ways of steam and electricity, for without these outward advantages I can grow in my inner manhood, but not without some notion of moral and spiritual law. Action is demanded of me and I need a rule for my action: something I am urged inwardly to become which I am not yet, and I would know what is the way and law,
what the central power or many conflicting powers and what the height and possible range and perfection of my becoming. That surely much more than the rule of electrons or the possibilities of a more omnipotent physical machinery and more powerful explosives is the real human question.

The Buddhists' mental and moral law of Karma comes in at this difficult point with a clue and an opening. As Science fills our mind with the idea of a universal government of Law in the physical and outward world and in our relations with Nature, though she leaves behind it all a great unanswered query, an agnosticism, a blank of some other ungrasped Infinite,—here covered by the concept of Chance,—the Buddhist conception too fills the spaces of our mental and moral being with the same sense of a government of mental and moral Law: but this too erects behind that Law a great unanswered query, an agnosticism, the blank of an ungrasped Infinite. But here the covering word is more grandly intangible; it is the mystery of Nirvana. This Infinite is figured in both cases by the more insistent and positive type of mind as an Inconscience,—but material in the one, in the other a spiritual infinite zero,—but by the more prudent or flexible thinkers simply as an unknowable. The difference is that the unknown of Science is something mechanical to which mechanically we return by physical dissolution or laya, but the unknown of Buddhism is a Permanent beyond the Law to which we return spiritually by an effort of self-suppression, of self-renunciation and, at the latest end, of self-extinction, by a mental dissolution of the Idea which maintains the law of relations and a moral dissolution of the world-desire which keeps up the stream of successions of the universal action. This is a rare and an austere metaphysics; but to its discouraging grandeur we are by no means compelled to give assent, for it is neither self-evident nor inevitable. It is by no means so certain that a high spiritual negation of what I am is my only possible road to perfection; a high spiritual affirmation and absolute of what I am may be also a feasible way and gate. This nobly glacial or blissfully void idea of a Nirvana, because it is so overwhelmingly a negation, cannot finally satisfy the human spirit, which
is drawn persistently to some highest positive and affirmation of itself and only uses negations by the way the better to rid itself of what comes in as an obstacle to its self-finding. To the everlasting No the living being may resign itself by an effort, a sorrowful or a superb turning upon itself and existence, but the everlasting Yes is its native attraction: our spiritual orientation, the magnetism that draws the soul, is to eternal Being and not to eternal Non-Being.

Nevertheless certain essential and needed clues are there in the theory of Karma. And first, there is this assurance, this firm ground on which I can base a sure tread, that in the mental and moral world as in the physical universe there is no chaos, fortuitous rule of chance or mere probability, but an ordered Energy at work which assures its will by law and fixed relation and steady succession and the links of ascertainable cause and effectuality. To be assured that there is an all-pervading mental law and an all-pervading moral law, is a great gain, a supporting foundation. That in the mental and moral as in the physical world what I sow in the proper soil, I shall assuredly reap, is a guarantee of divine government, of equilibrium, of cosmos; it not only grounds life upon an adamant underbase of law, but by removing anarchy opens the way to a greater liberty. But there is the possibility that if this Energy is all, I may only be a creation of an imperative Force and all my acts and becomings a chain of determination over which I can have no real control or chance of mastery. That view would resolve everything into predestination of Karma, and the result might satisfy my intellect but would be disastrous to the greatness of my spirit. I should be a slave and puppet of Karma and could never dream of being a sovereign of myself and my existence. But here there comes in the second step of the theory of Karma, that it is the Idea which creates all relations. All is the expression and expansion of the Idea, sarvāṇi vijñāna-vijrmbhitāni. Then I can by the will, the energy of the Idea in me develop the form of what I am and arrive at the harmony of some greater idea than is expressed in my present mould and balance. I can aspire to a nobler expansion. Still, if the Idea is a thing in itself, without any base but its own spontaneous
power, none originating it, no knower, no Purusha and Lord, I may be only a form of the universal Idea and myself, my soul, may have no independent existence or initiation. But there is too this third step that I am a soul developing and persisting in the paths of the universal Energy and that in myself is the seed of all my creation. What I have become, I have made myself by the soul's past idea and action, its inner and outer karma; what I will to be, I can make myself by present and future idea and action. And finally, there is this last supreme liberating step that both the Idea and its Karma may have their origin in the free spirit and by arriving at myself by experience and self-finding I can exalt my state beyond all bondage of Karma to spiritual freedom. These are the four pillars of the complete theory of Karma. They are also the four truths of the dealings of Self with Nature.
Karma and Freedom

The universe in which we live presents itself to our mentality as a web of opposites and contraries, not to say contradictions, and yet it is a question whether there can be in the universe any such thing as an entire opposite or a real contradiction. Good and evil seem to be as opposite powers as well can be and we are apt by the nature of our ethical mind to see the world, at any rate in its moral aspect, as a struggle and tug of war between these eternal opposites, God and devil, Deva and Asura, Ahuramazda, Anrya Mainyu. We hope always that on some as yet hardly conceivable day the one will perish and the other triumph and be convinced of eternity; but actually they are so intertwined that some believe they are here always together like light and shadow and, if at all, then only somewhere beyond this world of action, in some restful and silent eternity is there a release from the anguish of the knot of their intertwining, their bitter constant embrace and struggle. Good comes out of evil and again good itself seems often to turn to evil; the bodies of the wrestling combatants get so mixed and confounded together that to distinguish them the minds of the sages even are perplexed and bewildered. And it would seem sometimes as if this distinction hardly existed except for man and the spirits who urge him, perhaps since he ate of that tree of dual knowledge in the garden; for matter knows it not and life below man troubles itself but little, if at all, with moral differences. And it is said too that on the other side of human being and beyond its struggles is a serenity of the high and universal spirit where the soul transcends sin, but transcends also virtue, and neither sorrows nor repents nor asks “Why have I not done the good and wherefore have I done this which is evil?”¹ because in

¹ Taittiriya Upanishad.
it all things are perfect and to it all things are pure.

But there is a yet more radical instance of the eventual unreality of opposites. For the sages make too an opposition of the Knowledge and the Ignorance, — \textit{vidyā avidyā, citti acitti}, — on which this question of good and evil seems very intimately to hang. Evil runs behind an ignorant urge of the soul in nature, is itself an ignorant perversion of its will, and the partiality of good is equally an affliction of the Ignorance. But when we look closely into the essence of these two things, we find that on one side ignorance seems to be nothing else than an involved or a partial knowledge; it is knowledge wrapped up in an inconscient action or it is knowledge feeling out for itself with the tentacles of mind; and again on the other side knowledge itself appears to be at best a partial knowing and always to have something beyond of which it is ignorant, even its highest and widest splendour a golden outbreak of solar effulgence against the mass of blue-black light of infinity through which we look beyond it to the Ineffable.

Our mind is compelled to think always by oppositions, from the practical validity of which we cannot escape, but which yet seem always in some sort questionable. We get a perception of a law of Karma, the constant unavoidable successions of the acts of energy and its insistent stream of consequences and reactions, the chain of causality, the great mass of past causes behind us from which all future consequence ought infallibly to unroll itself, and by this we try to explain the universe; but then immediately there arises the opposite idea and the challenging problem of liberty. Whence comes this notion of liberty, this divine or this Titanic thirst in man for freedom, born perhaps of something in him by which, however finite be his mind and life and body, he participates in the nature of infinity? For when we look round on the world as it is, everything seems to be by necessity and to move under a leaden constraint and compulsion. This is the aspect of the unthinking world of Force and Matter in which we live; and even in ourselves, in man the thinker, how little is free from some kind of present constraint and of compelling previous necessity! So much of what we are and do
is determined by our environment, so much has been shaped by our education and upbringing, — we are made by life and by the hands of others, are clay for many potters: and, as for what is left, was it not determined, even that which is most ourselves, by our individual, our racial, our human heredity or in the last resort by universal Nature who has shaped man and each man to what he is for her blind or her conscient uses?

But we insist and say that we have a will which is aware of a however heavily burdened freedom and can shape to its own purpose and change by its effort environment and upbringing and the formations of heredity and even our apparently immutable common nature. But this will and its effort, is it not itself an instrument, even a mechanical engine of Nature, the active universal energy, and is not its freedom an arbitrary illusion of our mentality which lives in each moment of the present and separates it by ignorance, by an abstraction of the mind from its determining past, so that I seem at every critical moment to exercise a free and virgin choice, while all the time my choice is dominated by its own previous formation and by all that obscure past which I ignore? Granted that Nature works through our will and can create and change, can, that is to say, produce a new formation out of the stuff she has provided for her workings, is it not by a past impulsion and a continuous energy from it that the thing is done? That is the first idea of Karma. Certainly, our present will must come in as one though not by any means the sole element of the act and formation, but in this view it is not a free ever-new will, but in the first place a child and birth of all the past nature, our action, our present karma the result of an already formed shape of the force of that nature, swabhava. And in the second place our will is an instrument constantly shaped and used by something greater than ourselves. Only if there is a soul or self which is not a creation, but a master of Nature, not a formation of the stream of universal energy, but itself the former and creator of its own Karma, are we justified in our claim of an actual freedom or at least in our aspiration to a real liberty. There is the whole heart of the debate, the nodus and escape of this perplexed issue.
But here the critical negative analytic thinker, ancient nihilistic Buddhist or modern materialist, comes in to take away the basis of any actual freedom in our earthly or in any possible heavenly existence. The Buddhist denied the existence of a Self free and infinite; that, he thought, was only a sublimation of the idea of ego, an imposition, _adhyāropa_, or gigantic magnified shadow thrown by the falsehood of our personality on eternal Non-Existence. But as for the soul, there is no soul, but only a stream of forms, ideas and sensations, and as the idea of a chariot is only a name for the combination of planks and pole and wheels and axles, so is the idea of individual soul or ego only a name for the combination or continuity of these things. Nor is the universe itself anything other than such a combination, _saṅghāta_, formed and maintained in its continuity by the successions of Karma, by the action of Energy. In this mechanical existence there can be no freedom from Karma, no possible liberty; but there is yet a possible liberation, because that which exists by combination and bondage to its combinations can be liberated from itself by dissolution. The motive power which keeps Karma in motion is desire and attachment to its works, and by the conviction of impermanence and the cessation of desire there can come about an extinction of the continuity of the idea in the successions of Time.

But if this extinction may be called a liberation, it is yet not a status of freedom; for that can only repose upon an affirmation, a permanence, not upon a negative and extinction of all affirmations, and needs too, one would imagine, a someone or something that is free. The Buddha himself, it may be remarked, seems to have conceived of Nirvana as a status of absolute bliss of freedom, a negation of Karmic existence in some incognisable Absolute which he refused steadfastly to describe or define by any positive or any negative, — as indeed definition by any exclusive positive or widest sum of positives or any negative or complete sum of negatives would seem by the very fact of its bringing in a definition and thereby a limitation to be inapplicable to the Absolute. The Illusionist’s Maya is a more mystic thing and more obscure to the intelligence; but we have at least
here a Self, a positive Infinite which is capable therefore of an eternal freedom, but only in inaction, by cessation from Karma. For the self as the individual, the soul in action of Karma is bound always by ignorance, and only by rejection of individuality and of the cosmic illusion can we return to the liberty of the Absolute. What we see in both these systems is that spiritual freedom and the cosmic compulsion are equally admitted, but in a total separation and an exclusion from each other’s own proper field,—still as absolute opposites and contraries. Compulsion of ignorance or Karma is absolute in the world of birth; freedom of the spirit is absolute in a withdrawal from birth and cosmos and Karma.

But these trenchant systems, however satisfactory to the logical reason, are suspect to a synthetic intelligence; and at any rate, as we find that knowledge and ignorance are not in their essence absolute contraries but ignorance and inconscience itself the veil of a secret knowledge, so it may be at least possible that liberty and the compulsion of Karma are not such unbridgeable opposites, but that behind and even in Karma itself there is all the time a secret liberty of the indwelling Spirit. Buddhism and Illusionism too do not assert any external or internal predestination, but only a self-imposed bondage. And very insistently they demand of man a choice between the right and the wrong way, between the will to an impermanent existence and the will to Nirvana, between a will to cosmic existence and the will to an absolute spiritual being. Nor do they demand this choice of the Absolute or of the universal Being or Power, who indeed cares nothing for their claim and goes on very tranquilly and securely with his mighty eternal action, but they ask it of the individual, of the soul of man halting perplexed between the oppositions of his mentality. It would seem then that there is something in our individual being which has some real freedom of will, some power of choice of a great consequence and magnitude, and what is it then that thus chooses, and what are the limits, where the beginning or the end of its actual or its possible liberty?

Difficult also is it to understand how unsubstantial Impermanence can have such a giant hold or present this power of
eternal continuity in Time,—there must surely, one thinks, be a Permanent which expresses itself in this continuity, dhruvam adhruveṣu; or how an Illusion,—for what is illusion but an inconsequent dream or unsubstantial hallucination?—can build up this mighty world of just sequence and firm law and linked Necessity; some secret self-knowledge and wisdom there must be which guides the Energy of Karma in its idea and has appointed for her the paths she must hew in Time. It is because of their persistence of principle in all the transiences of particular form that things have such a hold on our mind and will. It is because the world is so real that we feel so potently its grasp on us and our spirits turn on it with this grip of the wrestler. It is often indeed too fiercely real for us and we seek for liberty in the realm of dream or planes of the ideal and, not finding it sufficiently there, because we have not the freedom nor can develop the mastery to impose our ideal on this active reality, we seek it beyond in the remote and infinite greatness of the Absolute. We shall do better then to fix on that other more generally admissible distinction, namely, of the world of Karma as a practical or relative reality and the being of the Spirit constant behind it or brooding above it as a greater supreme reality. And then we have to find whether in the latter alone is any touch of freedom or whether, as must surely be if it is the Spirit that presides over the Energy at work and over its action, there is here too some element or some beginning at least of liberty, and whether, even if it be small and quite relative, we cannot in these steps of Time, in these relations of Karma make this freedom great and real by dwelling consciously in the greatness of the Spirit. May not that be the sovereignty we shall find here when we rise to the top of the soul’s evolution?

One thing we will note that this urge towards control and this impression of freedom are an orientation and an atmosphere which cling about the action of mind, and they grow in Nature as she rises towards mentality. The world of Matter seems to know nothing about freedom; everything there appears as if written in sibylic laws upon tablets of stone, laws which have a process, but no initial reason, serve a harmony of purposes or at
least produce a cosmos of fixed results, but do not appear to be shaped with an eye to them by any discoverable Intelligence. We can think of no presence of soul in natural things, because we can see in them no conscious action of mind and a conscious active mental intelligence is to our notions the very basis and standing-ground, if not the whole stuff of soul-existence. If Matter is all, then we may very easily conclude that all is a Karma of material energy which is governed by some inherent incomprehensible mechanically legislating Necessity. But then we see that Life seems to be made of a different stuff; here various possibility develops, here creation becomes eager, pressing, flexible, protean; here we are conscious of a searching and a selection, many potentialities and a choice of actualities, of a subconscient idea which is feeling around for its vital self-expression and shaping an instinctive action,—often, though in certain limits, with an unerring intuitive guidance of life to its immediate objective or to some yet distant purpose,—of a subconscient will too in the fibre of all this vast seeking and mutable impulsion. But yet this too works within limits, under fetters, in a given range of processes.

But when we get out into mind, Nature becomes there much more widely conscious of possibility and of choice; mind is aware of potentialities and of determinations in idea which are other than those of the immediate actuality or of the fixedly necessary consequence of the sum of past and present actualities; it is aware of numberless “may-be”s and “might-have-been”s, and these last are not entirely dead rejected things, but can return through the power of the Idea and effect future determinations and can fulfil themselves at last in the inner reality of their idea though, it may well be, in other forms and circumstances. Moreover, mind can and does go still further; it can conceive of an infinite possibility behind the self-limitations of actual existence. And from this seeing there arises the idea of a free and infinite Will, a Will of illimitable potentiality which determines all these innumerable marvels of its own universal becoming or creation in Space and Time. That means the absolute freedom of a Spirit and Power which is not determined by Karma, but
determines Karma. Apparent Necessity is the child of the spirit’s free self-determination. What affects us as Necessity, is a Will which works in sequence and not a blind Force driven by its own mechanism.

This is not, however, a binding inference and always there remain on this head arguable by the reason three main conceptions which we can form of existence. First, there is the idea, facile to our reason, of a blind mechanical Necessity of some kind, — and against or behind that nothing or some absolute non-existence. The nature of this Necessity would be that of a fixed processus bound to certain initial and general determinations of which all the rest is the consequence. But that is only a first appearance of universal things, the stamp of phenomenal impression which we get from the aspect of the material universe. Then, there is the idea of a free infinite Being, God or Absolute, who somehow or other creates out of something or out of nothing, in reality or only in conception, or brings out of himself into manifestation a world of the necessity of his will or Maya or Karma in which all things, all creatures are bound as the victims of a necessity, not mechanical or external, but spiritual and internal, a force of Ignorance or a force of Karma or else some kind of arbitrary predestination. And, finally, there is the idea of an absolute free Existence which supports, develops and informs a universe of relations, of that Power as the universal Spirit of our existence, of the world as the evolution of these relations, of beings in the universe as souls who work them out with some freedom of the spirit as its basis, — for that they inwardly are, — but with an observation of the law of the relations as their natural condition.

This law would be in phenomenon or as seen in a superficial view of its sole outward machinery an apparent chain of necessity, but in fact it would be a free self-determination of the Spirit in existence. The free self and spirit would be there informing all the action of material energy, secretly conscient in its inconscience; his would be the movement of life and its inner spirit of guidance; but in mind would be something of the first open light of his presence. The soul evolving in Nature, prakṛtir jīvabhūtā, would be an immortal clouded Power of him
The Problem of Rebirth

growing into the light of the spirit and therefore towards the consciousness and reality of freedom. It would be bound at first in Nature and obey helplessly in all its action the urge of Karma, because on the surface the action of energy would be the whole truth of its kinetic being; the rest, the freedom, the origination is there, but concealed below, subliminal and therefore not at all manifest in the action. Even in mentality the action of Karma would be the main fact; everything would be determined by the nature of force of our active being working upon and responding to the influences of the environment and by the nature of quality of our active being which would colour and shape the character of these outcomings and responses. But that force is the force, that quality the quality of the soul; and as the soul grew aware of itself, the consciousness of Freedom would emerge, assert itself, insist, strive to grow into a firmly felt and possessed reality. Free in the spirit within, conditioned and determined in Nature, striving in his soul to bring out the spiritual light, mastery and freedom to work upon the obscurity and embarrassment of his first natural conditions and their narrow determinations, this would be the nature of man the mental being.

On this basis it becomes possible to come at some clear and not wholly antinomous relation between man's necessity and man's freedom, between his earthly human nature at whirl in the machinery of mind, life and body and the master Soul, the Godhead, the real Man behind whose consent supports or whose bidding governs its motions. The soul of man is a power of the self-existence which manifests the universe and not the creature and slave of a mechanical Nature; and it is only the natural instruments of his being, it is mind, life and body and their functions and members which are helpless apparatus and gear of the machinery. These things are subject to the action of Karma, but man in himself, the real man within is not its subject, na karma lipyate nare. Rather is Karma his instrument and its developments the material he uses, and he is using it always from life to life for the shaping of a limited and individual, which may be one day a divine and cosmic personality. For the eternal spirit enjoys an absolute freedom. This freedom appears to us no
doubt in a certain status, origin or background of all being as an unconditioned infinite of existence, but also it is in relation to the universe the freedom of an existence which displays an infinite of possibilities and has a power of shaping at will out of its own potentiality the harmonies of the cosmos. Man, too, may well be capable of a release, mokṣa, into the unconditioned Infinite by cessation of all action, mind and personality. But that is not the whole of the spirit’s absolute freedom; it is rather an incomplete liberty, since it endures only by its inaction. But the freedom of the Spirit is not so dependent; it can remain unimpaired in all this action of Karma and is not diminished or abrogated by the pouring of its energies into the whirl of the universe. And one may say that man cannot enjoy the double freedom because as man he is an individual being and therefore a thing in Nature, subject to Ignorance, to Karma. To be free he must get away from individuality, nature and Karma, and then man no longer exists, there is only the unconditioned Infinite. But this is to assume that there is no power of spiritual individuality, but only a power of individuation in Nature. All is then a formation of a nodus of mental, vital and physical Karma with which the one self for a long time mistakenly identifies its being by the delusion of ego. But if on the contrary there is any such thing as an individual power of spirit, it must, in whatever degree of actuality, share in the united force and freedom of the self-existent Divinity; for it is being of his being.

Freedom somewhere there is in our being and action, and we have only to see how and why it is limited in our outward nature, why here I am at all under any dominion of Karma. I appear to be bound by the law of an outward and imposed energy only because there is separation between my outward nature and my inmost spiritual self and I do not live in that outwardness with my whole being, but with a shape, turn and mental formation of myself which I call my ego or my personality. The cosmic spirit in matter seems itself to be so bound, for the same reason. It has started an outward compressed action, a law and disposition of material energy which must be allowed to unroll its consequences; itself holds back behind and conceals its shaping touch;
but still its supporting assent and impulse are there and these come out more into the open as Nature raises herself in the scales of life and mind. Nevertheless, I have to note that even in mind and even in its phenomenon of a conscious will Karma is the first law and there cannot be for me there a complete freedom; there is no such thing as a mental will which is absolutely free. And this is because mind is part of the action of the outward Ignorance, an action which seeks for knowledge but does not possess its full light and power, which can conceive of self and spirit and infinity and reflect them, but not altogether live in them, which can quiver with infinite possibility, but can only deal in a limited half-effective fashion with restricted possibilities. An Ignorance cannot be permitted to have, even if in its nature it could have, free mastery. It would never do for an ignorant mind and will to be given a wide and real freedom; for it would upset the right order of the energy which the Spirit has set at work and produce a most unholy confusion. It must be forced to obey or, if it resists, to bear the reaction of the Law; its partial freedom of a clouded and stumbling knowledge must be constantly overruled both in its action and its result by the law of universal Nature and the will of the seeing universal Spirit who governs the dispositions and consequences of Karma. This constrained overruled action is in patent fact the character of our mental being and action.

But still there is here something which we may call a relative freedom. It does not really belong to our outward mind and will or that shadow of myself which I have put forth in my mental ego; for these things are instruments and they work in the roads of the successions of Karma. But they still feel a power constantly coming forth and either assenting to or intervening in the action of the nature, and that power they attribute to themselves. They are aware of a relative freedom in their disposition of action and of at least a potential absolute freedom behind it, and mixing these two things confusedly together mind, will and ego cry out in unison “I am free.” But this freedom and power are influences from the soul. To use a familiar metaphysical language, they type the assent and will of the Purusha without which the Prakriti cannot move on her way. The first and the greater part
of this soul-influence is in the form of an assent to Nature, an acquiescence; and for good reason. For I start with the action of the universal Energy which the Spirit has set in motion and as I rise from the ignorance towards knowledge, the first thing demanded from me is to gather experience of its law and of my relations to the law and partly therefore to acquiesce, to allow myself to be moved, to see and to come to know the nature of the motions, to suffer and obey the law, to understand and know Karma.

This obedience is forcibly imposed on the lower ignorant creation. But thinking man who experiences increasingly from generation to generation and from life to life the nature of things and develops reflective knowledge and the sense of his soul in Nature, delivers in her a power of initiating will. He is not bound to her set actualities; he can refuse assent, and the thing in Nature to which it is refused goes on indeed for a time and produces its results by impetus of Karma, but as it runs, it loses power and falls into impotence and desuetude. He can do more, he can command a new action and orientation of his nature. The assent was a manifestation of the power of the soul as giver of the sanction, anumantā, but this is a power of the soul as active lord of the nature, īśvara. Then Nature still insists more or less on her old habitual way by reason of her past impetus or the right of previous sanctions and may even, in proportion as she is unaccustomed to control, resist and call in hostile powers, our own creations, the children of our past willings; then is there a battle in the house of our being between the lord and his spouse or between old and new nature and a defeat of the soul or its victory. And this is certainly a freedom, but only a relative freedom, and even the greatest mental self-mastery a relative and precarious thing at the best. This liberty when we look down at it from a higher station, is not well distinguishable from a lightened bondage.

The mental being in us can be a learner in the school of freedom, not a perfect adept. A real freedom comes when we get away from the mind into the life of the spirit, from personality to the Person, from Nature to the lord of Nature. There again
the first liberty is a passive power; it is of the nature of an assent; it is an observing and essential liberty in which the active part of the being is an instrument of the supreme Spirit and its universal action. But the assent is to the will of the Spirit and not to the mechanical force of Nature, and there is thrown on the mind the freedom of the spirit's light and purity and a right knowledge of relations and a clear detached assent to the divine workings. But if man would have too a freedom of power, of participation, of companionship as the son of God in a greater divine control, he must then not only get back from mind, but must stand, in his thought and will even, above the levels of mentality and find there a station of leverage, a spiritual *pou stô,* whence he can sovereignly move the world of his being. Such a station of consciousness there is in our supramental ranges. When the soul is one with the Supreme and with the universal not only in essence of consciousness and spiritual truth of being, but in expressive act too of consciousness and being, when it enjoys an initiating and relating truth of spiritual will and knowledge and the soul's overflowing delight in God and existence, when it is admitted to the spirit's fullness of assent to self and its creative liberty, its strain of an eternal joy in self-existence and self-manifestation, Karma itself becomes a rhythm of freedom and birth a strain of immortality.

2 A "where to stand", the station of leverage from which Archimedes, could he only have found it, undertook to move the world.

3 *Sambhiṭyā amṛtam aṣṭute,* “by birth he enjoys immortality.”
WILL, KARMA and consequence are the three steps of the Energy which moves the universe. But Karma and consequence are only the outcome of will or even its forms; will gives them their value and without it they would be nothing, nothing at least to man the thinking and growing soul and nothing, it may be hazarded, to the Spirit of which he is a flame and power as well as a creature. The thing we first see or imagine we see, when we look at the outward mechanism of the universe, is energy and its works, action and consequence. But by itself and without the light of an inhabiting will this working is only a huge soulless mechanism, a loud rattling of crank and pulley, a monstrous pounding of spring and piston. It is the presence of the spirit and its will that gives a meaning to the action and it is the value of the result to the soul that gives its profound importance to all great or little consequence. It would not matter to anyone or anything, not even to the cosmos itself, though this universal stir came to an end tomorrow or had never been created, if these suns and systems were not the field of a consciousness which there rolls out its powers, evolves its works, enjoys its creations, plans and exults in its immense aims and sequences. Spirit and consciousness and power of the spirit and Ananda are the meaning of existence. Take away this spiritual significance and this world of energy becomes a mechanical fortuity or a blind and rigid Maya.

The life of man is a portion of this vast significance, and since it is in him that on this material plane it comes out in its full capacity of meaning, a very important and central portion. The Will in the universe works up to him in the creative steps of its energy and makes of his nature a chariot of the gods on which it stands within the action, looks out on its works from the very front and no longer only from behind or above Nature’s doings
and moves on to the ultimate consequences and the complete evolution of its purpose. The will of man is the agent of the Eternal for the unveiling of his secret meaning in the material creation. Man’s mind takes up all the knots of the problem and works them out by the power of the spirit within him and brings them nearer to the full force and degree of their individual and cosmic solutions. This is his dignity and his greatness and he needs no other to justify and give a perfect value to his birth and his acts and his passing and his return to birth, a return which must be — and what is there in it to grieve at or shun? — until the work of the Eternal in him is perfected or the cycles rest from the glory of their labour.

This view of the world is the standpoint from which we must regard the question of man’s conscious will and its dealings with life, because then all things fall into their natural place and we escape from exaggerated and depreciated estimates. Man is a conscious soul of the Eternal, one with the Infinite in his inmost being, and the spirit within him is master of his acts and his fate. For fate is *fatum*, the form of act and creation declared beforehand by a Will within him and the universe as the thing to be done, to be achieved, to be worked out and made the self-expression of his spiritual being. Fate is *adṛśta*, the unseen thing which the Spirit holds hidden in the plan of its vision, the consequence concealed from the travailing mind absorbed in the work of the moment by the curtained nearnesses or the far invisible reaches of Time. Fate is *niyati*, the thing willed and executed by Nature, who is power of the Spirit, according to a fixed law of its self-governed workings. But since this Eternal and Infinite, our greater Self, is also the universal being, man in the universe is inseparably one with all the rest of existence, not a soul working out its isolated spiritual destiny and nature while all other beings are nothing but his environment and means or obstacles, — that they are indeed, but they are much more to him, — which is the impression cast on the mind by the thought or the religions that emphasise too much his centre of individuality or his aim of personal salvation. He is not indeed solely a portion of the universe. He is an eternal soul which, though limited for certain
temporal purposes in its outward consciousness, has to learn to enlarge itself out of those limits, to find and make effective its unity with the eternal Spirit who informs and transcends the universe. That spiritual necessity is the truth behind the religious dogma.

But also he is one in God and one in Nature with all beings in the cosmos, touches and includes all other souls, is linked to all powers of the Being that are manifest in this cosmic working. His soul, thought, will, action are intimate with the universal soul, thought, will and action. All acts on and through him and mixes with him and he acts too on all and his thought and will and life mix in and become a power of the one common life. His mind is a form and action of the universal mind. His call is not to be busy and concerned only with his own growth and perfection and natural destiny or spiritual freedom. A larger action too claims him. He is a worker in a universal work; the life of others is his life; world-consequence and the world-evolution are also his business. For he is one self with the selves of all other beings.

The dealings of our will with Karma and consequence have to be envisaged in the light of this double truth of man’s individuality and man’s universality. And seen in this light the question of the freedom of our individual will takes on another appearance. It becomes clear enough that our ego, our outward personality can be only a minor, a temporal, an instrumental form of our being. The will of the ego, the outward, the mentally personal will which acts in the movement cannot be free in any complete or separate sense of freedom. It cannot so be free because it is bound by its partial and limited nature and it is shaped by the mechanism of its ignorance, and again because it is an individualised form and working of the universal energy and at every moment impinged upon and modified and largely shaped by environing wills and powers and forces. But also it cannot so be free because of the greater Soul in us behind the mind which determines works and consequence according to the will in its being and the nature, its power of being, not in the moment but in the long continuities of Time, not solely by the immediate
adaptation to the environment, but by its own previous intention which has shaped the environment and already predetermined in great part the present act and consequence. The inward will in the being which is in intimacy with that Power is the real will and this outward thing only an instrumentation for a working out from moment to moment, a spring of the karmic mechanism. That inward will we find when we get back to it, to be a free will, not armoured in a separate liberty, but free in harmony with the freedom of the Spirit guiding and compelling Nature in all souls and in all happenings. This thing our outward mind cannot see easily because the practical truth which it feels is the energy of Nature at once working on us from without and forming too our action from within and reacting upon herself by the mental will, her instrument, to continue her self-shaping for farther Karma and farther consequence. Yet are we aware of a self and the presence of this self imposes on our minds the idea of someone who wills, someone who shapes even the nature and is responsible for consequence.

To understand one must cease to dwell exclusively on the act and will of the moment and its immediate consequences. Our present will and personality are bound by many things, by our physical and vital heredity, by a past creation of our mental nature, by environmental forces, by limitation, by ignorance. But our soul behind is greater and older than our present personality. The soul is not the result of our heredity, but has prepared by its own action and affinities this heredity. It has drawn around it these environmental forces by past karma and consequence. It has created in other lives the mental nature of which now it makes use. That ancient soul of long standing, sempiternal in being, puruṣaḥ purāṇaḥ sanātanaḥ, has accepted the outward limitation, the outward ignorance as a means of figuring out in a restriction of action from moment to moment the significance of its infinity and the sequence of its works of power. To live in this knowledge is not to take away the value and potency of the moment’s will and act, but to give it an immensely increased meaning and importance. Then each moment becomes full of things infinite and can be seen taking up the work of a past
eternity and shaping the work of a future eternity. Our every thought, will, action carries with it its power of future self-determination and is too a help or a hindrance for the spiritual evolution of those around us and a force in the universal working. For the soul in us takes in the influences it receives from others for its own self-determination and gives out influences which the soul in them uses for their growth and experience. Our individual life becomes an immensely greater thing in itself and is convinced too of an abiding unity with the march of the universe.

And karma and consequence also get a wider meaning. At present we fix too much on the particular will and act of the moment and a particular consequence in a given time. But the particular only receives its value by all of which it is a part, all from which it comes, all to which it moves. We fix too much also on the externalities of karma and consequence, this good or that bad action and result of action. But the real consequence which the soul is after is a growth in the manifestation of its being, an enlarging of its range and action of power, its comprehension of delight of being, its delight of creation and self-creation, and not only its own but the same things in others with which its greater becoming and joy are one. Karma and consequence draw their meaning from their value to the soul; they are steps by which it moves towards the perfection of its manifested nature. And even when this object is won, our action need not cease, for it will keep its value and be a greater force of help for all these others with whom in self we are one. Nor can it be said that it will have no self-value to the soul grown aware of freedom and infinity; for who shall persuade me that my infinity can only be an eternal full stop, an endless repose, an infinite cessation? Much rather should infinity be eternally capable of an infinite self-expression.

The births of the soul are the series of a constant spiritual evolution, and it might well seem that when the evolution is finished, and that must be, it might at first appear, when the soul involved in ignorance returns to self-knowledge, the series of our births too ought to come to a termination. But that is only one
side of the matter, one long act here of the eternal drama, doing, karma. The spirit we are is not only an eternal consciousness and eternal being; its characters are an eternal power of being and an eternal Ananda. Creation is not to the spirit a trouble and an anguish, but a delight expressed, even though in the entirety of its depths inexpressible, fathomless, endless, inexhaustible. It is only the limited action of mind in the ignorance straining after possession and discovery and unable to find the concealed power of the spirit that makes of the delight of action and creation a passion or suffering: for, limited in capacity and embarrassed by life and body, it has yet desires beyond its capacity, because it is the instrument of a growth and the seed of an illimitable self-expression and it has the pain of the growth and the pain of the obstacle and the pain of the insufficiency of its action and delight. But let this struggling self-creator and doer of works once grow into the consciousness and power of the secret infinite spirit within it and all this passion and suffering passes away into an immeasurable delight of liberated being and its liberated action.

The Buddhist perception of karma and suffering as inseparable, that which drove the Buddha to the search for a means of the extinction of the will to be, is only a first phase and partial appearance. To find self is the cure of suffering, because self is infinite possession and perfect satisfaction. But to find self in quiescence is not the whole meaning of the spiritual evolution, but to find it too in its power of being; for being is not only eternal status, but also eternal movement, not only rest, but also action. There is a delight of rest and a delight of action, but in the wholeness of the spirit these two things are no longer contraries, but one and inseparable. The status of the spirit is an eternal calm, but also its self-expression in world-being is without any beginning or end, because eternal power means an eternal creation. When we gain the one, we need not lose its counterpart and consequence. To get to a foundation is not to destroy all capacity for superstructure.

Karma is nothing but the will of the Spirit in action, consequence nothing but the creation of will. What is in the will of being, expresses itself in karma and consequence. When the will
is limited in mind, karma appears as a bondage and a limitation, consequence as a reaction or an imposition. But when the will of the being is infinite in the spirit, karma and consequence become instead the joy of the creative spirit, the construction of the eternal mechanist, the word and drama of the eternal poet, the harmony of the eternal musician, the play of the eternal child. This lesser, bound, seemingly separate evolution is only a step in the free self-creation of the Spirit from its own illimitable Ananda. That is behind all we are and do; to hide it from mind and bring it slowly forward into the front of existence and action is the present play of Self with Nature.
Rebirth and Karma

The ancient idea of Karma was inseparably connected with a belief in the soul’s continual rebirth in new bodies. And this close association was not a mere accident, but a perfectly intelligible and indeed inevitable union of two related truths which are needed for each other’s completeness and can with difficulty exist in separation. These two things are the soul side and the nature side of one and the same cosmic sequence. Rebirth is meaningless without karma, and karma has no fount of inevitable origin and no rational and no moral justification if it is not an instrumentality for the sequences of the soul’s continuous experience. If we believe that the soul is repeatedly reborn in the body, we must believe also that there is some link between the lives that preceded and the lives that follow and that the past of the soul has an effect on its future; and that is the spiritual essence of the law of Karma. To deny it would be to establish a reign of the most chaotic incoherence, such as we find only in the leaps and turns of the mind in dream or in the thoughts of madness, and hardly even there. And if this existence were, as the cosmic pessimist imagines, a dream or an illusion or, worse, as Schopenhauer would have it, a delirium and insanity of the soul, we might accept some such law of inconsequent consequence. But, taken even at its worst, this world of life differs from dream, illusion and madness by its plan of fine, complex and subtle sequences, the hanging together and utility even of its discords, the general and particular harmony of its relations, which, if they are not the harmony we would have, not our longed-for ideal harmony, has still at every point the stamp of a Wisdom and an Idea at work; it is not the act of a Mind in tatters or a machine in dislocation. The continuous existence of the soul in rebirth must signify an evolution if not of the self, for that is said to be immutable, yet of its more outward active
soul or self of experience. This evolution is not possible if there is not a connected sequence from life to life, a result of action and experience, an evolutionary consequence to the soul, a law of Karma.

And on the side of Karma, if we give to that its integral and not a truncated meaning, we must admit rebirth for the sufficient field of its action. For Karma is not quite the same thing as a material or substantial law of cause and effect, the antecedent and its mechanical consequence. That would perfectly admit of a Karma which could be carried on in time and the results come with certainty in their proper place, their just degree by a working out of the balance of forces, but need not in any way touch the human originator who might have passed away from the scene by the time the result of his acts got into manifestation. A mechanical Nature could well visit the sins of the fathers not on them, but on their fourth or their four-hundredth generation, as indeed this physical Nature does, and no objection of injustice or any other mental or moral objection could rise, for the only justice or reason of a mechanism is that it shall work according to the law of its structure and the fixed eventuality of its force in action. We cannot demand from it a mind or a moral equity or any kind of supraphysical responsibility. The universal energy grinds out inconsciently its effects and individuals are only fortuitous or subordinate means of its workings; the soul itself, if there is a soul, makes only a part of the mechanism of Nature, exists not for itself, but as a utility for her business. But Karma is more than a mechanical law of antecedent and consequence. Karma is action, there is a thing done and a doer and an active consequence; these three are the three joints, the three locks, the three sandhis of the connexus of Karma. And it is a complex mental, moral and physical working; for the law of it is not less true of the mental and moral than of the physical consequence of the act to the doer. The will and the idea are the driving force of the action, and the momentum does not come from some commotion in my chemical atoms or some working of ion and electron or some weird biological effervescence. Therefore the act and consequence must have some relation to the will and the
idea and there must be a mental and moral consequence to the soul which has the will and idea. That, if we admit the individual as a real being, signifies a continuity of act and consequence to him and therefore rebirth for a field of this working. It is evident that in one life we do not and cannot labour out and exhaust all the values and powers of that life, but only carry on a past thread, weave out something in the present, prepare infinitely more for the future.

This consequence of rebirth would not follow from the very nature of Karma if there were only an All-Soul of the universe. For then it would be that which is carrying on in myriads of forms its past, working out some present result, spinning yarn of karma for a future weft of consequence. It is the All-Soul which would be the originator, would upbear the force of the act, would receive and exhaust or again take up for farther uses the returning force of the consequence. Nothing essential would depend on its doing all these things through the same individual mask of its being. For the individual would only be a prolonged moment of the All-Soul, and what it originated in this moment of its being which I call myself, might very well produce its result on some other moment of the same being which from the point of view of my ego would be somebody quite different from and unconnected with myself. There would be no injustice, no unreason in such an apparently vicarious reaping of the fruit or suffering of the consequence; for what has a mask, though it be a living and suffering mask, to do with these things? And, in fact, in the nature of life in the material universe a working out of the result of the action of one in the lives of many others, an effect of the individual’s action on the group or the whole is everywhere the law. What I sow in this hour, is reaped by my posterity for several generations and we can then call it the karma of the family. What the men of today as community or people resolve upon and execute, comes back with a blessing or a sword upon the future of their race when they themselves have passed away and are no longer there to rejoice or to suffer; and that we can speak of as the karma of the nation. Mankind as a whole too has a karma; what it wrought in its past, will shape its future
destiny; individuals seem only to be temporary units of human thought, will, nature who act according to the compulsion of the soul in humanity and disappear; but the karma of the race which they have helped to form continues through the centuries, the millennia, the cycles.

But we can see, when we look into ourselves, that this relation of the individual to the whole has a different significance; it does not mean that I have no existence except as a more or less protracted moment in the cosmic becoming of the All-Soul: that too is only a superficial appearance and much subtler and greater is the truth of my being. For the original and eternal Reality, the Alpha and Omega, the Godhead is neither separate in the individual nor is he only and solely a Pantheos, a cosmic spirit. He is at once the eternal individual and the eternal All-Soul of this and many universes, and at the same time he is much more than these things. This universe might end, but he would still be; and I too, though the universe might end, could still exist in him; and all these eternal souls would still exist in him. But as his being is for ever, so the succession of his creations too is for ever; if one creation were to come to an end, it would be only that another might begin and the new would carry on with a fresh commencement and initiation the possibility that had not been worked out in the old, for there can be no end to the self-manifestation of the Infinite. Nasti anto vistarasya me. The universe finds itself in me, even as I find myself in the universe, because we are this face and that face of the one eternal Reality, and individual being is as much needed as universal being to work out this manifestation. The individual vision of things is as true as the universal vision, both are ways of the self-seeing of the Eternal. I may now see myself as a creature contained in the universe; but when I come to self-knowledge, I see too the universe to be a thing contained in myself, subtly by implication in my individuality, amply in the great universalised self I then become. These are data of an ancient experience, things known and voiced of old, though they may seem shadowy and transcendental to the positive modern mind which has long pored so minutely on outward things that
it has become dazed and blind to any greater light and is only slowly recovering the power to see through its folds; but they are for all that always valid and can be experienced today by any one of us who chooses to turn to the deepest way of the inner experience. Modern thought and science, if we look at the new knowledge given us in its whole, do not contradict them, but only trace for us the outward effect and workings of these realities; for always we find in the end that truth of self is not contradicted, but reproduced and made effectual here by law of Energy and law of Matter.

The necessity of rebirth, if we look at it from the outward side, from the side of energy and process, stands upon a persistent and insistent fact which supervenes always upon the generality of common law and kind and constitutes the most intimate secret of the wonder of existence, the uniqueness of the individual. And this uniqueness is everywhere, but appears as a subordinate factor only in the lower ranges of existence. It becomes more and more important and pronounced as we rise in the scale, enlarges in mind, gets to enormous proportions when we come to the things of the spirit. That would seem to indicate that the cause of this significant uniqueness is something bound up with the very nature of spirit; it is something it held in itself and is bringing out more and more as it emerges out of material Nature into self-conscious. The laws of being are at bottom one for all of us, because all existence is one existence; one spirit, one self, one mind, one life, one energy of process is at work; one will and wisdom has planned or has evolved from itself the whole business of creation. And yet in this oneness there is a persistent variety, which we see first in the form of a communal variation. There is everywhere a group energy, group life, group mind, and if soul is, then we have reason to believe that however elusive it may be to our seizing, there is a group-soul which is the support and foundation—some would call it the result—of this communal variety. That gives us a ground for a group karma. For the group or collective soul renews and prolongs itself and in man at least develops its nature and experience from generation to generation. And who knows whether, when
one form of it is disintegrated, community or nation, it may not wait for and assume other forms in which its will of being, its type of nature and mentality, its attempt of experience is carried forward, migrates, one might almost say, into new-born collective bodies, in other ages or cycles? Mankind itself has this separate collective soul and collective existence. And on that community the community of karma is founded; the action and development of the whole produces consequence of karma and experience for the individual and the totality even as the action and development of the individual produces consequences and experience for others, for the group, for the whole. And the individual is there; you cannot reduce him to a nullity or an illusion; he is real, alive, unique. The communal soul-variation mounts up from the rest, exceeds, brings in or brings out something new, adds novel powers in the evolution. The individual mounts and exceeds in the same way from the community. It is in him, on his highest heights that we get the flame-crest of self-manifestation by which the One finds himself in Nature.

And the question is how does that come about at all? I enter into birth, not in a separate being, but in the life of the whole, and therefore I inherit the life of the whole. I am born physically by a generation which is a carrying on of its unbroken history; the body, life, physical mentality of all past being prolongs itself in me and I must therefore undergo the law of heredity; the parent, says the Upanishad, recreates himself by the energy in his seed and is reborn in the child. But as soon as I begin to develop, a new, an independent and overbearing factor comes in, which is not my parents nor my ancestry, nor past mankind, but I, my own self. And this is the really important, crowning, central factor. What matters most in my life, is not my heredity; that only gives me my opportunity or my obstacle, my good or my bad material, and it has not by any means been shown that I draw all from that source. What matters supremely is what I make of my heredity and not what my heredity makes of me. The past of the world, bygone humanity, my ancestors are there in me; but still I myself am the artist of my self, my life,
my actions. And there is the present of the world, of humanity, there are my contemporaries as well as my ancestors; the life of my environment too enters into me, offers me a new material, shapes me by its influence, lays its direct or its indirect touch on my being. I am invaded, changed, partly recreated by the environing being and action in which I am and act. But here again the individual comes in subtly and centrally as the decisive power. What is supremely important is what I make of all this surrounding and invading present and not what it makes of me. And in the interaction of individual and general Karma in which others are causes and produce an effect in my existence and I am a cause and produce an effect on them, I live for others, whether I would have it so or no, and others live for me and for all. Still the central power of my psychology takes its colour from this seeing that I live for my self, and for others or for the world only as an extension of my self, as a thing with which I am bound up in some kind of oneness. I seem to be a soul, self or spirit who constantly with the assistance of all create out of my past and present my future being and myself too help in the surrounding creative evolution.

What then is this all-important and independent power in me and what is the beginning and the end of its self-creation? Has it, even though it is something independent of the physical and vital present and past which gives to it so much of its material, itself no past and no future? Is it something which suddenly emerges from the All-Soul at my birth and ceases at my death? Is its insistence on self-creation, on making something of itself for itself, for its own future and not only for its fleeting present and the future of the race, a vain preoccupation, a gross parasitical error? That would contradict all that we see of the law of the world-being; it would not reduce our life to a greater consistency with the frame of things, but would bring in a freak element and an inconsistency with the pervading principle. It is reasonable to suppose that this powerful independent element which supervenes and works upon the physical and vital evolution, was in the past and will be in the future. It is reasonable also to suppose that it did not come in suddenly from some
unconnected existence and does not pass out after one brief intervention; its close connection with the life of the world is rather a continuation of a long past connection. And this brings in at once the whole necessity of past birth and karma. I am a persistent being who pursue my evolution within the persistent being of the world. I have evolved my human birth and I help constantly in the human evolution. I have created by my past karma my own conditions and my relations with the life of others and the general karma. That shapes my heredity, my environment, my affinities, my connections, my material, my opportunities and obstacles, a part of my predestined powers and results, not arbitrarily predestined but predetermined by my own stage of nature and past action, and on this groundwork I build new karma and farther strengthen or subtilise my power of natural being, enlarge experience, go on with my soul evolution. This process is woven in with the universal evolution and all its lines are included in the web of being, but it is not merely a jutting point or moment of it or a brief tag shot into the tissue. That is what rebirth means in the history of my manifested self and of universal being.

The old idea of rebirth errs on the contrary by an excessive individualism. Too self-concentrated, it treated one’s rebirth and karma as too much one’s own single affair, a sharply separate movement in the whole, leaned too much on one’s own concern with one’s self and even while it admitted universal relations and a unity with the whole, yet taught the human being to see in life principally a condition and means of his own spiritual benefit and separate salvation. That came from the view of the universe as a movement which proceeds out of something beyond, something from which each being enters into life and returns out of it to its source, and the absorbing idea of that return as the one thing that at all matters. Our being in the world, so treated, came in the end to be regarded as an episode and in sum and essence an unhappy and discreditable episode in the changeless eternity of the Spirit. But this was too summary a view of the will and the ways of the Spirit in existence. Certain it is that while we are here, our rebirth or karma, even while it
runs on its own lines, is intimately one with the same lines in the
universal existence. But my self-knowledge and self-finding too
do not abolish my oneness with other life and other beings. An
intimate universality is part of the glory of spiritual perfection.
This idea of universality, of oneness not only with God or the
eternal Self in me, but with all humanity and other beings, is
growing to be the most prominent strain in our minds and it
has to be taken more largely into account in any future idea
or computation of the significance of rebirth and karma. It was
admitted in old times; the Buddhist law of compassion was a
recognition of its importance; but it has to be given a still more
pervading power in the general significance.

The self-effectuation of the Spirit in the world is the truth
on which we take our foundation, a great, a long self-weaving
in time. Rebirth is the continuity of that self-effectuation in the
individual, the persistence of the thread; Karma is the process, a
force, a work of energy and consequence in the material world,
an inner and an outer will, an action and mental, moral, dy-
namic consequence in the soul evolution of which the material
world is a constant scene. That is the conception; the rest is a
question of the general and particular laws, the way in which
karma works out and helps the purpose of the spirit in birth
and life. And whatever those laws and ways may be, they must
be subservient to this spiritual self-effectuation and take from
it all their meaning and value. The law is a means, a line of
working for the spirit, and does not exist for its own sake or
for the service of any abstract idea. Idea and law of working are
only direction and road for the soul's progress in the steps of its
existence.
Karma and Justice

WHAT ARE the lines of Karma? What is the intrinsic character and active law of this energy of the soul and its will and development of consequence? To ask that question is to ask what is the form taken here by the dynamic meaning of our existence and what the curves of guidance of its evolving self-creation and action. And such a question ought not to be answered in a narrow spirit or under the obsession of some single idea which does not take into account the many-sidedness and rich complexity of this subtle world of Nature. The law of Karma can be no rigid and mechanical canon or rough practical rule of thumb, but rather its guiding principle should be as supple a harmonist as the Spirit itself whose will of self-knowledge it embodies and should adapt itself to the need of self-development of the variable individual souls who are feeling their way along its lines towards the right balance, synthesis, harmonies of their action. The karmic idea cannot be — for spirit and not mind is its cause — a cosmic reflection of our limited average human intelligence, but rather the law of a greater spiritual wisdom, a means which behind all its dumb occult appearances embodies an understanding lead and a subtle management towards our total perfection.

The ordinary current conception of law of Karma is dominantly ethical, but ethical in no very exalted kind. Its idea of karma is a mechanical and materialistic ethics, a crudely exact legal judgment and administration of reward and punishment, an external sanction to virtue and prohibition of sin, a code, a balance. The idea is that there must be a justice governing the award of happiness and misery on the earth, a humanly intelligible equity and that the law of Karma represents it and gives us its formula. I have done so much good, punya. It is my capital, my accumulation and balance. I must have it paid out
to me in so much coin of prosperity, the legal currency of this sovereign and divine Themis, or why on earth should I at all do good? I have done so much evil. That too must come back to me in so much exact and accurate punishment and misfortune. There must be so much outward suffering or an inward suffering caused by outward event and pressure; for if there were not this physically sensible, visible, inevitable result, where would be any avenging justice and where could we find any deterrent sanction in Nature against evil? And this award is that of an exact judge, a precise administrator, a scrupulous merchant of good for good and evil for evil who has learned nothing and will never learn anything of the Christian or Buddhistic ideal rule, has no bowels of mercy or compassion, no forgiveness for sin, but holds austerely to an eternal Mosaic law, eye for eye, tooth for tooth, a full, slow or swift, but always calm and precisely merciless *lex talionis*.

This commercial and mathematical accountant is sometimes supposed to act with a startling precision. A curious story was published the other day, figuring as a fact of contemporary occurrence, of a rich man who had violently deprived another of his substance. The victim is born as the son of the oppressor and in the delirium of a fatal illness reveals that he has obliged his old tyrant and present father to spend on him and so lose the monetary equivalent of the property robbed minus a certain sum, but that sum must be paid now, otherwise — The debt is absolved and as the last pice is expended, the reborn soul departs, for its sole object in taking birth is satisfied, accounts squared and the spirit of Karma content. That is the mechanical idea of Karma at its acme of satisfied precision. At the same time the popular mind in its attempt to combine the idea of a life beyond with the notion of rebirth, supposes a double prize for virtue and a double penalty for transgression. I am rewarded for my good deeds in heaven after death until the dynamic value of my virtue is exhausted and I am then reborn and rewarded again materially on earth. I am punished in hell to the equivalence of my sins and again punished for them in another life in the body. This looks a little superfluous and a rather redundant
justice, and, even, the precise accountant becomes very like an unconscionable hundred per cent usurer. Perhaps it may be said that beyond earth it is the soul that suffers — for purification, and here the physical being — as a concession to the forces of life and the symmetry of things: but still it is the soul that thus pays double in its subtle experience and in its physical incarnation.

The strands of our nature which mix in this natural but hardly philosophic conception, have to be disentangled before we can disengage the right value of these ideas. Their first motive seems to be ethical, for justice is an ethical notion; but true ethics is dharma, the right fulfilment and working of the higher nature, and right action should have right motive, should be its own justification and not go limping on the crutches of greed and fear. Right done for its own sake is truly ethical and ennobles the growing spirit; right done in the lust for a material reward or from fear of the avenging stripes of the executioner or sentence of the judge, may be eminently practical and useful for the moment, but it is not in the least degree ethical, but is rather a lowering of the soul of man; or at least the principle is a concession to his baser animal and unspiritual nature. But in natural man, born before the higher dharma and more potent and normal as a motive to action, come two other very insistent things, kāma, artha, desire and pleasure of enjoyment with its corresponding fear of suffering, and interest of possession, acquisition, success with its complementary pain of lacking and frustration, and this is what governs most prominently the normal barbaric or still half barbaric natural man. He needs to some not small extent if he is to conform his close pursuit of desire and interest to the ethical standard, a strict association or identity of result of virtue with some getting of his interest and pleasure and result of sin with some loss of materially or vitally desirable things and the infliction of mental, vital or physical pain. Human law proceeds on this principle by meeting the grosser more obvious offences with punishment and avenging pain or loss and on the other hand assuring the individual in some degree of the secure having of his legitimate pleasure and interest if he observes the legal rule. The cosmic law is expected by the popular theory of
Karma to deal with man on his own principle and do this very thing with a much sterner and more unescapable firmness of application and automatic necessity of consequence.

The cosmic Being must be then, if this view is to hold, a sort of enlarged divine Human or, we might say, a superior anthropoid Divine, or else the cosmic Law a perfection and magnitude of human methods and standards, which deals with man as he is accustomed to deal with his neighbour,—only not with a rough partial human efficacy, but either a sure omniscience or an unfailing automatism. Whatever truth there may be behind that notion, this is not likely to be an adequate account of the matter. In actual life, if we put aside the rebirth theory, there are traces of this method, but it does not work out with any observable consistency,—not even if we accept an unsatisfactory and hardly just vicarious punishment as part of the scheme. What surety have we, then, of its better or its faultless working out in rebirth except for some similar partial signs and indications and, to fill in the blanks, our general sense of the fitness of things? And again where does the true nature of ethics come in in this scheme? That more elevated action, it would almost seem, is an ideal movement of less use for the practical governance of life than as one part of a preparation for a fourth and last need of man, his need of spiritual salvation, and salvation winds up finally our karma and casts away the economy along with the very thought and will of life. Desire is the law of life and action and therefore of Karma. To do things above the material level for their own sake and their pure right or pure delight is to head straight towards the distances of heaven or the silence of the Ineffable. But this is a view of the meaning of existence against which it is time for the higher seeing mind and being of man to protest and to ask whether the ways of the Spirit in the world may not be capable of a greater, nobler and wiser significance.

But still, since the mind of man is part of the universal mind and reflects something of it in a however broken or as yet imperfect and crookedly seeing fashion, there may well be something of a real truth behind this view, though it is not likely to be the whole or the well understood truth. There are some certain or
probable laws of the universal working which are relevant to it and must enter into the account. First, it is sure that Nature has laws of which the observance leads to or helps well-being and of which the violation imposes suffering; but all of them cannot be given a moral significance. Then there is the certainty that there must be a moral law of cause and consequence in the total web of her weaving and this we would perhaps currently put into the formula that good produces good and evil evil, which is a proposition of undoubted truth, though also we see in this complicated world that evil comes out of what we hold to be good, and again out of evil disengages itself something that yet turns to good. Perhaps our system of values is too rigidly precise or too narrowly relative; there are subtle things in the totality, minglings, interrelations, cross-currents, suppressed or hidden significances which we do not take into account. The formula is true, but is not the whole truth, at least as now understood in its first superficial significance.

And at any rate in the ordinary notion of Karma we are combining two different notions of good. I can well understand that moral good does or ought to produce and increase moral good and moral evil to farther and to create moral evil. It does so in myself. The habit of love confirms and enhances my power of love; it purifies my being and opens it to the universal good. The habit of hatred on the contrary corrupts my being, fills it with poison, with bad and morbid toxic matter, and opens it to the general power of evil. My love ought also by a prolongation or a return to produce love in others and my hatred to give rise to hatred; that happens to a certain, a great extent, but it need not be and is not an invariable or rigorous consequence; still we may well see and believe that love does throw out widening ripples and helps to elevate the world while hatred has the opposite consequence. But what is the necessary connection between this good and evil on the one hand and on the other pleasure and pain? Must the ethical power always turn perfectly into some term of kindred hedonistic result? Not entirely; for love is a joy in itself, but also love suffers; hatred is a troubled and self-afflicting thing, but has too its own perverse delight of itself and
its gratifications; but in the end we may say that love, because it is born of the universal Delight, triumphs in its own nature and hatred because it is its denial or perversion, leads to a greater sum of misery to myself as to others. And of all true moral good and real evil this may be said that the one tends towards some supreme Right, the ētam of the Vedic Rishis, the highest law of a highest Truth of our being and that Truth is the door of the spirit’s Ananda, its beatific nature, the other is a missing or perversion of the Right and the Truth and exposes us to its opposite, to false delight or suffering. And even in the perplexed steps of life some reflection of this identity must emerge.

This correspondence is, still, more essentially true in the inner field, in the spiritual, mental and emotional result and reaction of the good or the evil or of the effects of its outgoing action. But where is the firm link of correspondence between the ethical and the more vital and physical hedonistic powers of life? How does my ethical good turn into smiling fortune, crowned prosperity, sleek material good and happiness to myself and my ethical evil into frowning misfortune, rugged adversity, sordid material ill and suffering,—for that is what the desire soul of man and the intelligence governed by it seem to demand,—and how is the account squared or the transmutation made between these two very different energies of the affirmation and denial of good? We can see this much that the good or the evil in me translates itself into a good or an evil action which among other things brings about much mental and material happiness and suffering to others, and to this outgoing power and effect there ought to be an equal reaction of incoming power and effect, though it does not seem to work itself out immediately or with any discoverable exactness of correspondence. There does still appear to be a principle of rebound in Nature; our action has in some degree the motion of recoil of the boomerang and cycles back towards the will that has cast it on the world. The stone we hurl rashly against the universal Life is cast back at us and may crush, maim or injure our own mental and physical being. But this mechanical rebound is not the whole principle of Karma. Nor is Karma wholly a mixed ethical-hedonistic order
in its total significance, for there are involved other powers of 
our consciousness and being. Nor is it again a pure mechanism 
which we set going by our will and have then helplessly to 
accept the result; for the will which produced the effect, can also 
intervene to modify it. And above all the initiating and receiving 
consciousness can change the values and utilities of the reactions 
and make another thing of life than this automatic mechanism 
of fateful return or retribution to the half-blind embodied actor 
in a mute necessity of rigorous law of Nature.

The relation of our consciousness and will to Karma is the 
thing upon which all the subtler lines of action and consequence 
must depend; that connexus must be the hinge of the whole 
significance. The dependence of the pursuit of ethical values on 
a sanction by the inferior hedonistic values, material, vital and lower mental pleasure, pain and suffering, appeals strongly to 
our normal consciousness and will; but it ceases to have more 
than a subordinate force and finally loses all force as we grow 
towards greater heights of our being. That dependence cannot 
then be the whole or the final power or guiding norm of Karma. 
The relation of will to action and consequence must be cast 
on more subtle and liberal lines. The universal Spirit in the 
law of Karma must deal with man in the lower scale of values 
only as a part of the transaction and as a concession to man's 
own present motives. Man himself puts these values, makes that 
demand for pleasure and prosperity and dreads their opposites, 
desires heaven more than he loves virtue, fears hell more than he 
abhors sin, and while he does so, the world-dispensation wears 
to him that meaning and colour. But the spirit of existence is not 
merely a legislator and judge concerned to maintain a standard 
of legal justice, to dole out deterrents and sanctions, rewards and penalties, ferocious pains of hell, indulgent joys of paradise. He 
is the Divine in the world, the Master of a spiritual evolution and 
the growing godhead in humanity. That godhead grows however 
slowly beyond the dependence on the sanctions of pleasure and 
pain. Pain and pleasure govern our primary being and in that 
primary scale pain is Nature's advertisement of things we should 
avoid, pleasure her lure to things she would tempt us to pursue.
These devices are first empirical tests for limited objects; but as I grow, I pass beyond their narrower uses. I have continually to disregard Nature’s original warnings and lures in order to get to a higher nature. I have to develop a nobler spiritual law of Karma.

This will be evident if we consider our own greater motives of action. The pursuit of Truth may entail on me penalties and sufferings; the service of my country or the world may demand from me loss of my outward happiness and good fortune or the destruction of my body; the increase of my strength of will and greatness of spirit may be only possible by the ardours of suffering and the firm renunciation of joys and pleasures. I must still follow after Truth, I must do the service to my race my soul demands from me; I must increase my strength and inner greatness and must not ask for a quite irrelevant reward, shun penalty or make a bargain for the exact fruits of my labour. And that which is true of my action in the present life, must be equally true of my connected action and self-development through many births. Happiness and sorrow, good fortune and ill-fortune are not my main concern whether in this birth or in future lives, but my perfection and the higher good of mankind purchased by whatever suffering and tribulation. Spinoza’s dictum that joy is a passage to a greater perfection and sorrow a passage to a lesser perfection is a much too summary epigram. Delight will be indeed the atmosphere of perfection and attends too even the anguish of our labour towards it, but first a higher delight which has often much trouble for its price, and afterwards a highest spiritual Ananda which has no dependence on outward circumstances, but rather is powerful to new-shape their meanings and transform their reactions. These things may be above the first formulation of the world energy here, may be influences from superior planes of the universal existence, but they are still a part of the economy of Karma here, a process of the spiritual evolution in the body. And they bring in a higher soul nature and will and action and consequence, a higher rule of Karma.

The law of Karma is therefore not simply an extension of the human idea of practical justice into future births and
a rectification there of the apparent injustice of life. A justice or rather a justness there must be in all the workings of the world-energy; Nature certainly seems to be scrupulous in her measures. But in the life of man there are many factors to be taken into the reckoning; there are too stages, grades, degrees. And on a higher step of our being things do not look the same nor are quite the same as on a lower grade. And even in the first normal scale there are many factors and not only the ethical-hedonistic standard. If it is just that the virtuous man should be rewarded with success and happiness and the wicked man punished with downfall and pain at some time, in some life, on earth or in heaven or in hell, it is also just that the strong man should have the reward of his cultivated strength, the intellectual man the prize of his cultivated skill, the will that labours in whatever field the fruit of its effort and its works. But it does not work rightly, you say, not morally, not according to the ethical law? But what is right working in this connection of will and action and consequence? I may be religious and honest, but if I am dull, weak and incompetent? And I may be selfish and impious, but if I have the swift flame of intellect, the understanding brain, the skill to adapt means to ends, the firm courageous will fixed on its end? I have then an imperfection which must impose its consequences, but also I have powers which must make their way. The truth is that there are several orders of energy and their separate characteristic working must be seen, before their relations can be rightly discovered in the harmonies of Nature. A complex web is what we have to unravel. When we have seen the parts in the whole, the elements and their affinities in the mass, then only can we know the lines of Karma.
Section II

The Lines of Karma
The Foundation

The IDEA of Karma has behind it two ideas that are its constituent factors, a law of Nature, of the energy or action of Nature, and a soul that lives under that law, puts out action into that energy and gets from it a return in accordance and measure with the character of its own activities. And here certain considerations have at once intervened which it will not do to ignore. This putting out of action and its return cannot have anything more than a mechanical importance, it cannot have a mental, moral and spiritual significance, if the action of universal Nature is something quite different from the soul’s action in character, in meaning, in the law of her being that constitutes it, if it is not itself the energy, the work of a Mind, a Soul, a Spirit. If the individual energy is that of a soul putting out action and receiving a return in kind, physical, mental, moral and spiritual from the universal energy, the universal energy too that makes the return should be that of an All-Soul in which and in relation to which this individual flame of the All-Soul lives. And it is apparent, if we consider, that the individual’s energy of action is not something miraculously separate and independent, it is not a power born of itself, living in itself, acting in its separate and wholly self-formed puissance. On the contrary it is the universal that acts in the individual energy and acts, no doubt with an individual application, but on universal lines and in harmony with its universal law. But if that were all the truth, then there would be no real individual and no responsibility of any kind except the responsibility of universal Nature to carry out the idea or to execute the force put forth in the individual as in the universal by the All-Soul, the cosmic Spirit. But there is also this soul of the individual, and that is a being of the Infinite and a conscious and efficient portion of the All-Soul, a deputy or representative, and puts forth the energy given to it according
to its own potentiality, type, limits with a will that is in some sense its own. The Spirit in the cosmos is the lord, the Ishwara of all Nature, but the individual soul is likewise a representative, a delegate Ishwara, the underlord at least if not the overlord of his nature, — the recipient, agent and overseer, let us say, of his own form and use of the universal energy of Nature.

And next we see that each being is actually in life, in the world an individual in a species and each species has a nature of its own, a Swabhava or way of the self-being, and each individual too a nature of his own, an individual way of his self-being within that of the species. The law of the action is determined generally by this swabhava of the species and individually by the swabhava of the individual but within that larger circle. Man is at once himself, in a certain way peculiar and unique, and a depressed portion of God and a natural portion of mankind. There is in other words a general and an individual Swadharma or natural principle and law of all action for the kind and for the individual in the kind. And it is clear too that every action must be a particular application, a single result, a perfect or imperfect, right or perverted use of the general and within it of the individual swadharma.

But again, if that were all, if each man came into life with his present nature ready determined for him and irrevocable and had to act according to it, there would be no real responsibility; for he would do good according to the good and evil according to the evil in his nature, he would be imperfect according to its imperfection or perfect according to its perfection; and he might have to suffer the return of his good or evil, bear exactly the just consequences of his perfection or his imperfection, but mechanically and not by his choice: for his apparent choice would be the compulsion of the nature in him and could not be in any way, directly or indirectly, the result of his spirit’s will. But in fact there is within his being a power of development, a power of change, or in the language of our modern conceptions an evolutionary power. His nature is what it is because he has so made it by his past; he has induced this present formulation by a precedent will in his spirit. He has risen to humanity by
the force of his spirit and by the power of the All-Soul out of the vast possibilities of universal Nature. He has developed by his own long evolution of that humanity the character and law of action of his present individual being; he has built his own height and form of human nature. He may change what he has made, he may rise even, if that be within the possibilities of the universe, beyond human and to or towards superhuman nature. It is the possibility of the universal Nature and her law that determines his natural being and action, but it is part of her law to be subject to the spirit, and she will develop in reply to an insistent call; for then she must respond, she must supply the needed energy, she must determine the acts in that direction, she must assure its issue. His past and his present nature and the environment he has secured may present constant obstacles, but they must still yield in the end to the evolutionary will in him in proportion to its sincerity, wholeness and insistence. All the possibility of the All-being is in him, all the power of the All-Will is behind him. This evolution and all its circumstances, his life, its form, its events, its values arise out of that urge and are shaped according to the past, present or future active will of his spirit. As is his use of the energy, so was and will be the return of the universal energy to him now and hereafter. This is the fundamental meaning of Karma.

At the same time this action and evolution of the spirit taking birth in a body are not an easy and simple thing, as it would or might be if Nature were all of one piece and evolution were only a raising of the degrees of a single power. For there are many strands, many degrees, many forms of energy of Nature. There is in the world of birth an energy of physical being and nature, arising out of the physical an energy of vital being and nature, arising out of the vital an energy of mental being and nature, arising out of the mental an energy of spiritual or supramental being and nature. And each of these forms of energy has a law of its own, lines of its own action, a right to its own manner of operation and existence, because each is fundamental to some necessity of the whole. And we see accordingly that each in its impulse follows its
own lines regardless of the rest, each in the combination imposes as much of its domination as it can on the others. The mental being is itself a most complex thing and has several forms of energy, an intellectual, a moral, an emotional, a hedonistic energy of mental nature, and the will in each is in itself absolute for its own rule and is yet forced to be modified in action by the running into it and across it of the other strands. The way and the movement of the world action are indeed a difficult and entangled process, gahanā kar mano gatiḥ, and therefore too the way and movement of our own action which we cannot separate in its law, however much the mere mind in us might like to have it so, from the law of the world action. And if all these energies are forms of energy of the nature of the Spirit, then it is likely that only when we rise into the consciousness of the supreme spiritual being can we hope wholly to understand all the integral secret and harmony of the world action and therefore the integral meaning and law of Karma.

It may therefore serve a partial purpose but can be of little eventual advantage to try to cut the knot of the riddle by reducing to the law of one form of energy alone all the apparent tangle of the cosmic action. The universe is not solely an ethical proposition, a problem of the antinomy of the good and the evil; the Spirit of the universe can in no way be imagined as a rigid moralist concerned only with making all things obey the law of moral good, or a stream of tendency towards righteousness attempting, hitherto with only a very poor success, to prevail and rule, or a stern Justicer rewarding and punishing creatures in a world that he has made or has suffered to be full of wickedness and suffering and evil. The universal Will has evidently many other and more supple modes than that, an infinity of interests, many other elements of its being to manifest, many lines to follow, many laws and purposes to pursue. The law of the world is not this alone that our good brings good to us and our evil brings evil, nor is its sufficient key the ethical-hedonistic rule that our moral good brings to us happiness and success and our moral evil brings to us sorrow and misfortune. There is a rule
of right in the world, but it is the right of the truth of Nature and of the truth of the spirit, and that is a vast and various rule and takes many forms that have to be understood and accepted before we can reach either its highest or its integral principle.

The will in the intellectual being may erect knowledge and truth of knowledge as the governing principle of the Spirit, the will in the volitional being may see Will or Power as very God, the will in the aesthetic being enthroned beauty and harmony as the sovereign law, the will in the ethical being a vision of it as Right or Love or Justice, and so on through a long chapter. But even though all these may very well be supreme aspects of the Supreme, it will not do to shut up the acts of the Infinite into one formula. And for a beginning it is best to phrase the law of Karma as generally and vaguely as may be and put it simply thus without any particular colour or content that according to the energy put forth shall be its return, not with any mathematical precision of conscious will and its mechanical consequences, but subject to the complicated working of many world forces. If we thus state broadly our foundation, the simplicity of the ordinary solutions disappears, but that is a loss only to love of dogma or to the mind’s indolence. The whole law of the cosmic action or even the one law governing all the others cannot well be the measure of a physical, mechanical and chemical energy, nor the law of a life force, nor a moral law or law of mind or of idea forces; for it is evident that none of these things by its single self covers or accounts for all the fundamental powers. There is likely to be something else of which all these are the means and energies.

Our initial formula itself can be only a general mechanical rule, but still it is likely to be the practical rule of all parts of the mechanism, and if it only states itself and does at first nothing more, yet an impartial regard on the variety of its operations may open out many meanings and may lead us to the essential significance.

The practical and the efficient base of Karma is all the relation of the soul to the energies of Nature, the use by Purusha of Prakriti. It is the soul’s demand on, consent to or use of the energies of Nature and the return and reflex of her energies on the soul that must determine the steps of our progress in
our births, whether that progress be in a given direction or a long up and down or in a perpetual circle. There is another, a circumstantial aspect of the law of Karma and that hinges on the turn of our action not only to our self, but to others. The nature of the energies we put forth and even the return and reflex of their consequence upon us affects not only ourselves but all around us and we must account too for the direction of our acts upon others, its effect upon them and the return of the direction and rebound of consequence of the effect upon our own life and being. But the energy we put forth on others is ordinarily of a mixed character, physical, vital, moral, mental and spiritual, and the return and consequence too are of a mixed character. A physical action, a vital pressure thrown forth from ourselves carries in it a mental or moral as well as a physical and vital power and issues often quite beyond our conscious will and knowledge and the consequence to ourselves and to others is found to be different enough in character and measure from anything we intended or could have calculated and foreseen. The calculation escapes us because too complex by far is the universal energy acting through us and our conscious will intervenes in it simply as an instrument; our real acceptance is that of a more fundamental power within, a secret, a subliminal assent of our subconscious and superconscient spirit. And the return too, whatever the agents, is of the same complex universal energy and determined by some difficult correlation of the force acting and the force acted upon in her.

But there is another, an ultimate and essential sense of Karma, a relation in it between the soul in us and the Supreme or the All-Self; on that all is founded and to that all leads and must refer to it at every step. That relation too is not so simple a thing as is imagined by the religions. For it must answer to a very vast spiritual sense underlying the whole process of Karma and there must be a connection of each of our workings in the use of the universal energy to that fundamental and perhaps infinite significance. These three things, the will of the soul in Nature and the action of Nature in and on the soul and through it and back to it, the effect of the intercrossing between the action of
the soul on others and the return to it of the force of its action complicated by theirs, and the meaning of the soul’s action in relation to its own highest Self and the All-Self, to God, make up between them all the bearings of Karma.
The Terrestrial Law

A CONSIDERATION of the lines of Karma ought certainly to begin with a study of the action of the world as it is, as a whole, however contrary it may be to the rule or to the desire of our moral or our intellectual reason, and to see if we cannot find in its own facts its own explanation. If the actual truth of the world breaks out from the too rigid cadres our moral sense or our intelligence would like to see imposed on the freely or the inevitably self-determining movement of the Infinite, on the immeasurable largeness of his being or the mighty complexities of his will, it is very likely that that is because our moral sense and our intellect, since they are mental and human, are too narrow to understand or to bind him. Any shifting of the base of the problem by which we get out of the difficulty, impose our limits on what overpasses us and compel God to be even as ourselves, may very well be an evasion and an intellectual device and not the way of truth. The problem of knowledge is after all this, to reflect the movements of the Infinite and see, and not to force it into a mould prepared for it by our intelligence.

The ordinary idea of Karma follows this latter unsound method. The world we see is to our notions, if not immoral, yet non-moral and contradictory to our idea of what it should be. Therefore we go behind it, discover that this earth life is not all, erect anew there our moral rule and rejoice to find that after all the universe does obey our human conceptions and therefore all is well. The mysterious conflict, the Manichean struggle, the inextricable tangle here of good and evil is not cured or accounted for, but we say that at least the good and the evil are justly dealt with according to their kind, this duly rewarded and that duly punished in other worlds or other births, there is therefore a dominant moral law and we may cherish a faith that the good will prevail, Ahuramazda conquer and not Ahriman,
and on the whole all is as it should be. Or if not, if the tangle is
inextricable, if this world is evil or existence itself an enormous
mistake — as it must be, man is inclined to think, if it does not
suit his desires and conceptions, — then at least I individually
by satisfying the moral law may get out of the tangle away to
the pleasures of a better world or to the bodiless and mindless
peace of Nirvana.

But the question is whether this is not a rather childish and
impatient mood and whether these solutions come anywhere
near solving the whole complexity of the problem. Let us grant
that a dominant moral law governs, not action, — for that is
either free or, if not free, compelled to be of all kinds, — but the
result of action in the world and that a supreme good will work
itself out in the end. The difficulty remains why that good should
use evil as one and almost the chief of its means or the dominant
moral law, sovereign, unescapable, categorical, imperative, the
practical governor, if not the reason of our existence, should
be compelled to fulfil itself through so much that is immoral
and by the agency of a non-moral force, through hell on earth
and hell beyond, through petty cruelty of punishment and huge
fury of avenging calamity, through an immeasurable and, as it
seems, never ending sequence of pain and suffering and torture.
It must surely be because there are other things in the Infinite
and therefore other laws and forces here and of these the moral
law, however great and sovereign to itself, has to take account
and is compelled to accommodate its own lines to their curve of
movement. And if that is so our plain course, if we are to see the
true connections, is to begin by studying the separate law and
claim of these other forces: for till it is done we cannot know
rightly how they act upon and condition or are acted upon and
utilised by any moral rule that we may distinguish intervening
in the complex of the world action. And first let us look at the
terrestrial law as it is apart from any question of rebirth, the
joining, the play, the rule, the intention of the forces here: for it
may be that the whole principle is already there and that rebirth
does not so much correct or change as complete its significance.

But on earth the first energy is the physical; the lines of
the physical energy creating the forms, deploying the forces of
the material universe are the first apparent conditions of our
birth and create the practical basis and the original mould of
our earthly existence. And what is the law of this first energy,
its self-nature, swabhava and swadharma? It is evidently not
moral in the human sense of the word: the elemental gods of the
physical universe know nothing about ethical distinctions, but
only the bare literal rule of energy, the right track and circuit
of the movement of a force, its right action and reaction, the
just result of its operation. There is no morality, no hesitation of
conscience in our or the world’s elements. The fire is no respecter
of persons and if the saint or the thinker is cast into it, it will
not spare his body. The sea, the stormwind, the rock on which
the ship drives do not ask whether the just man drowned in
the waters deserved his fate. If there is a divine or a cosmic
justice that works in these cruelties, if the lightning that strikes
impartially tree or beast or man, is— but it would appear in
the case of the man alone, for the rest is accident,—the sword
of God or the instrument of Karma, if the destruction wrought
by the volcano, the typhoon or the earthquake is a punishment
for the sins of the community or individually of the sins in a
past life of each man there that suffers or perishes, at least the
natural forces know it not and care nothing about it and rather
they conceal from us in the blind impartiality of their rage all
evidence of any such intention. The sun shines and the rain
falls on the just and the unjust alike; the beneficence and the
maleficence of Nature, the gracious and dreadful Mother, her
beauty and terror, her utility and her danger are bestowed and
inflicted without favour or disfavour on all her children and the
good man is no more her favourite than the sinner. If a law of
moral punishment is imposed through the action of her physical
forces, it must be by a Will from above her or a Force acting
unknown to her in her inconscient bosom.

But such a Will could not be itself that of a moral Being
ethical after the conceptions of man,—unless indeed it resem-
bled man in his most coldly pitiless and savage moral reason
or unreason. For its action involves terrors of punishment that
would be abhorred as atrocities in an all-powerful human ruler
and could not be other than monstrous in a moral Divine Ruler.
A personal God so acting would be a Jehovah-Moloch, a mer-
ciless and unrighteous demander of righteousness and mercy.
On the other hand an inconscient Force mechanically executing
an eternal ethical rule without an author or mover would be
a paradox: for morality is a creation of conscious mind; an
inconscient machinery could have no idea of good and evil, no
moral intention or significance. An impersonal or omni-personal
conscious Will or Spirit in the universe could well enact such a
law and assure its execution, but must then be, although impos-
ing on us good and evil and their results, itself beyond good and
evil. And what is this but to say that the universal Being escapes
from our ethical limitations and is a supramoral, appearing to
us here in physical Nature as an infra-moral, Infinite?

Now, that a conscious Infinite is there in physical Nature, we
are assured by every sign, though it is a consciousness not made
or limited like ours. All her constructions and motions are those
of an illimitable intuitive wisdom too great and spontaneous and
mysteriously self-effective to be described as an intelligence, of a
Power and Will working for Time in eternity with an inevitable
and forecasting movement in each of its steps, even in those
steps that in their outward or superficial impetus seem to us
inconscient. And as there is in her this greater consciousness and
greater power, so too there is an illimitable spirit of harmony and
beauty in her constructions that never fails her, though its works
are not limited by our aesthetic canons. An infinite hedonism
too is there, an illimitable spirit of delight, of which we become
aware when we enter into impersonal unity with her; and even
as that in her which is terrible is a part of her beauty, that in her
which is dangerous, cruel, destructive is a part of her delight, her
universal Ananda. If then all else in us, our intelligence, our dy-
namic and volitional, our aesthetic, our hedonistic being, when
they regard the physical universe, feel intuitively the satisfaction
in it of something great and illimitable but still mysteriously of
their own kind, must not our moral sense, our sense of Right,
find too there the satisfaction of something of which it is itself the
reflection? An intuitive perception of this kind is at the root of our demand for a moral order in the universe. Yes, but here too our partial conceptions, our own moral canons are not sufficient; this is a greater and illimitable Right, not bound to the ethical formula, and its first principle is that each thing should observe the law of its own energy and each energy move in its own lines in the total scheme and fulfil its own function and make its own returns. The physical law is the right and justice, the duty, the ought of the physical world. The godhead of Fire in the Upanishad, questioned by the Spirit, “What is the power in thee?” makes answer “This is my power that whatever is cast to me, I burn,” and a similar answer is made by each physical thing to the question of the life and the mind. It observes the lines of its physical energy and is concerned with no other law or justice. No law of Karma, the moral law included, could exist, if there were not to begin with this principle as the first foundation of order.

What then is the relation of man to this physical Nature, man this soul intervening in and physically born of her in a body subjected to her law of action? what his function as something that is yet more than her, a life and a mind and a spirit? what his swabhava, his swadharma? First, he owes to her a mechanical obedience of which she herself working in his body takes care: but also, as a soul evolving the power of consciousness secret in her, his business is to know and to use her law and even in knowing and using it to transcend her more material limit, habit, purpose and formula. Observance of Nature but also transcendence of first nature is continually the purpose of the Spirit within him. A continuous series of transcendences is the most significant thing in the world action and evolution itself is only Nature’s constant impulse and effort of self-exceeding, of a greater self-becoming, her way of expressing more and more, getting out a greater form of birth and awakened power of presence of the self that is in her. Life brings in a whole range of these transcendences, mind another and greater range, and since mind is so evidently imperfect and incomplete, a thing of seeking in its very nature, there must surely be a range or many ranges
of transcendence above mind. Man meets with the powers of his mind the rule of the physical action and the law of vital Karma, brings in a law of mental and moral Karma and lifts along the ladder of these scales to something more, to a potency of spiritual action which may even lead him to an exceeding of Karma itself, a freedom from or of birth and becoming, a perfecting transcendence.

Man’s exceeding of the physical law does not come solely by his evolution of a moral sense in a non-moral world of Nature. Its essential rule is rather a turning of a conscious intelligence and will on life and matter, morality itself only this knowledge and will seeking for a rule of truth and right of action, satyam rtam, in his relation to his inner self and to his fellow-beings. But his dealings with the purely physical lines of Nature are non-moral, a matter at first of observance where he must, of satisfaction by instinctive or experienced utilisings, of suffering at her hands by compulsion, and more and more, as he grows, of a struggle of his knowledge and will to know and master her forces for his use and pleasure, for instruments and expedients, for a greater base and circle of opportunities, for the joy itself of will and knowledge. He makes her forces his opportunities and to increase them faces her perils. He defies her powers, transgresses her limitations, sins constantly against her first prohibitions, takes her punishments and overcomes them, becomes by wrestling of his mind and will with her acquainted with her greater possibilities which she herself has left unused while she waited for his coming. She meets his effort with physical obstruction and opposition, with a No that constantly recedes, with the mask of his own ignorance, with the menace of her danger. One might suggest the fancy,—attributing to her that resistance which certain instincts in man oppose to the daring of spiritual adventure, to new enlargings of knowledge, new forms of will or new standards of conduct, regarding them stupidly as sin and impiety because they transgress what is established,—that to physical Nature in her first power life itself with its starts and deviations and stumblings and sufferings is a sin against her law of sure physical harmony and exact measure and much
more mind with its daring, its sin of boundless adventure, its final yearnings towards the unmeasured, the above-law, the infinite.

But in fact all that the godhead of physical Nature is concerned with in man's dealings with her is to observe a just law of return of her energies to his effort. Wherever his knowledge and will can harmonise itself with the lines of her energies, she makes a return according to its action on her: where it works on her with insufficiency, ignorance, carelessness, error, she overthrows his effort or injures; as he wills more and discovers more, she returns to him a greater utility and fruit of her powers, consents to his masteries and favours his violences. He has arrived at a unity, a Yoga with her in her greater secret possibilities, — he has liberated them and, as he uses them, so he has from her their return. He observes and he extends for her her lines and she responds with an exact ministry and obedience. All this he can do at present within certain physical limits and lines of working and there is a modification but not a radical change. There are indications that by a more direct pressure of a mental and psychical energy on the physical, the response can be made more variable, the physical depart from what seem to be fixed limits and habits, and it is conceivable that as knowledge and will entered into the region of higher and yet higher powers, the action of physical energy might grow entirely responsive, giving whatever return is seemingly demanded from her, and its lines perfectly flexible. But even this transcendence would have to regard the great original measures fixed by the All-Will: there could be a free use, perhaps a large transformation of the physical energy, but not a departure from its fundamental law and purpose.

All this founds a reign of law, a principle of the just return of energy that is the neutral essence of Karma, but it has no eye of regard for ethical measures and no moral significance. Man may and does invent cruel and immoral means of getting at physical knowledge and its powers or turn to unethical ends the energies she places at his service, but that is a matter between his will and his own soul and of his relation with other living beings, his and their concern and not hers. Physical Nature gives impartially her
results and rewards and demands from man observance not of the moral but the physical law: she asks for a just knowledge and a scrupulous practice of her physical lines and nothing else. There is no karmic retort from her on the many cruelties of science, no revolt against an unethical use of her facilities, much punishment of ignorance but none of wickedness. If there is something in the lower rounds of Nature which reacts against certain transgressions of the moral law, it begins obscurely on a higher scale, with life. A vital reaction of the kind there is and it produces physico-vital effects, but mark that in this kind of reaction there is no observance of our limits and measures, but rather the same promiscuous impartiality as in the acts of physical Nature. In this field we have to admit a law of vicarious punishment, a constant smiting of the innocent for the sins of the guilty which would seem shocking and brutally unethical and unjust to us if inflicted by a human being. Life seems to punish itself for its errors and excesses without any care to limit the reaction to the agent of the excess or the error. There is here an order of the lines of energy that is not at least primarily or in intention ethical, but rather concerned with a system of returns not governed by our moral ideas.

The movements of life seem indeed to be as little as the physical laid on ethical lines. The fundamental right and justice of life is to follow the curve of the vital energies, to maintain the functions of the life force and to give a return to its own powers. Its function is to survive, to reproduce itself, to grow and possess and enjoy, to prolong and enlarge and assure its action, power, having, pleasure as much as earth will allow. All means are good to life that secure these ends: the rest is a matter of right balance between the vital energy and its physical means, of a putting forth of its powers and the kind of return it gets for those powers. At first — and this continues even after the emergence of mind in life and as long as mind is subservient to the life force, — that is all we see. Vital nature works out her ends faultlessly enough, but not by any means blamelessly in the ethical sense. Death is her second means of self-preservation, destruction her constant instrument for change and renovation.
and progress, suffering inflicted on oneself or on others often-
est her price for victory and pleasure. All life lives upon other life, makes a place for itself by encroachment and exploitation, possesses by association but even more by struggle. Life acts by mutual shock and mutual use of creatures by each other; but it works only partly by mutual help and very much by a mutual assault and devouring. And its reproduction is bound to be immoral in itself and, when raised to its ascetic or puritan acuities, rejects as vile. And yet when once we put aside our limited human conceptions and look with impersonal eyes on this vast and various and wonderful vital nature into which we are born, we find in it a mysteriously perfect order, the work of a deep and illimitable intuitive wisdom, an immense Power and will at its perfectly seeing work, a great whole of beauty and harmony built out of what seems to us a system of discords, a mighty joy of life and creation which no heaviest toll of individual death or suffering can tire or discourage and which, when we enter into oneness with the great Ananda of its movement, these things seem rather to cast into relief and against the hue of its ecstasy these shades not to matter. There is here also, in these steps of vital Nature and the law of her energies, a truth of the infinite; and this truth of the Infinite’s insistence on life, life as it were for its own sake and for the joy of creation has its own standards of right and harmony, just balance and measure, fit action and reaction of energy that cannot be judged by the human rule. It is a pre-
mental and still impersonal Tapas and Ananda and therefore a still non-moral order.

Man’s relation with vital Nature is, again, first to be one with it by observance and obedience to its rule, then to know and direct it by conscious intelligence and will and to transcend by that direction the first law of life, its rule and habit, formula, initial significance. At first he is compelled to obey its instincts and has to act even as the animal, but in the enlarged terms of a mentalised impulsion and an increasingly clear consciousness and responsible will in what he does. He too has first to strive
to exist, to make a place for himself and his kind, to grow and possess and enjoy, to prolong, to enlarge and assure the first vital lines of his life movement. He too does it even as the others, by battle and slaughter, by devouring, by encroachment, by laying his yoke on earth and her products and on her brute children and on his fellow-men. His virtue, his dharma of the vital nature, *virtus, aretē*, is at first an obligation to strength and swiftness and courage and all things that make for survival, mastery and success. Most even of the things in him that evolve an ethical significance have at root not a truly ethical but a dynamic character, — such as self-control, *tapasyā*, discipline. They are vital-dynamic, not ethical energies; they are a rightly massed and concentrated, rightly ordered putting forth of mentalised life forces and the return they seek and get are of the vital and dynamic kind, power, success, mastery, increased capacities of vital possession and expansion or the result of these things, vital-hedonistic, the satisfaction of his desires, vital happiness, enjoyment and pleasure.

Man’s first business is to bring his conscious intelligence and will to enlarge the lines of life of the individual and the race. Here again it is to these two powers primarily and only secondarily and partially to any moral force that the life energy gives its returns. The battle in life’s primitive values is to the strong and the race to the swift, and the weak and the torpid cannot claim the goal and the crown on the strength of their greater virtue; and there is in this a justice, while the moral principle of reward would be here an injustice, for it would be a denial of the principle of the right returns of energy which is fundamental to any possible law of Karma. Raise the action by the powers of the mind and still the greater successes, the glory and the victory, fall to the men of great intelligence and the men of great will and not necessarily to the more ethical intelligence or to the more moralised will. Morality counts in this dynamic aspect of life only as a prudential check or a concentrating tapasya. Life helps those who most wisely and faithfully follow her impulses while observing her limits and restraints or those who most powerfully aid her greater impulses of expansion. It is those that get the most
The greater movement at the same time brings in a power of greater suffering as well as joy, the greater sins of life and its greater virtues. Man as he dares the perils of physical nature, dares too the perils of the vital energy by transgressing her safe rules and limits which she imposes automatically on the animal. There are balances of her use of her energies, safe measures and restraints which make living as secure as it can be, — for all living is naturally a peril and an adventure, but a certain prudence in Nature minimises the adventure as much as is consistent with her ends and the intelligence of man tries to do still better, to live securely and not dangerously, to exclude the more formidable incertitudes from the order of his life. But the instinct of expansion in man is continually breaking Nature’s vital balances and disregarding his own limits and measures. He is avid of experience, of the unmeasured and unknown in power and experience and enjoyment as of the common and known and safe, of the perilous extremes as of the sane averages. He must sound all life’s possibilities, test the wrong as well as the right use of her energies, pay his toll of suffering and get his prize of more splendid victories. As far as mind working in life’s ways can do it, he has to enlarge the lines of life and to make a transformation of its action and its possibilities. This has hitherto been a greatening of forms and never gone so far as to make a radical change and override its first nature. It is only by a transformation of our inner life that we can get beyond the magnified, mentalised, reasoning and consciously willing animal that for the most part the greater number of us are and only by raising it up to unity with some spiritual power we have not yet reached that we can hope to transform vital nature and make her a free instrument of the higher spirit. Then man may be really what he strives to be, master of his life, in control of vital and physical Nature.

Meanwhile it is through an inward turn of his mind that he gets to something like a transcendence, a living not for life but for truth, for beauty, for power of the soul, for good and right,
love, justice. It is this endeavour that brings down into the lower rounds of energy the powers of a higher circle, something of a mental and a truly moral tending at its end to become a spiritual law of action and the fruits of action of Karma.
Mind Nature and Law of Karma

MAN IS not after all in the essence of his manhood or in the inner reality of his soul a vital and physical being raised to a certain power of mental will and intelligence. If that were so, the creed that makes our existence a manifestation of a Will to life, a Life Force moved by no other object than its own play, heightening, efficient power, expansion, might have a good chance of being the sufficient theory of our universe, and the law of our Karma, the rule of our activities would be in entire consonance with that one purpose and ordered by that dominant principle. Certainly in a great part of this world's outer activities,—or if we, fixing our eye mainly on the vital play of the spirit of the universe, consider them as man's chief business and the main thing that matters,—there is a colourable justification for this limited view of the human being. But the more he looks into himself and the more he goes inward and lives intimately and pre-eminently in his mind and soul, the more he discovers that he is in his essential nature a mental being encased in body and emmeshed in the life activities, manu, manomaya puruṣa. He is more than a thinking, willing and feeling result of the mechanism of the physical or an understanding nexus of the vital forces. There is a mental energy of his being that overtops, pervades and utilises the terrestrial action and his own terrestrial nature.

This character of man's being prevents us from resting satisfied with the vitalistic law of Karma: the lines of the vital energy are interfered with and uplifted and altered for man by the intervention of the awakened mental energy of the spirit that emerges in the material universe and creates here on earth the form of man for its habitation, his complex nature to be its expressive power, the gamut of its music, and the action of his thought, perception, will, emotions the notation of its
harmonies. The apparent inconscience of physical Nature, the beautiful and terrible, kindly and cruel conscious but amoral Life Force that is the first thing we see before us, are not the whole self-expression of the universal Being here and therefore not the whole of Nature. Man comes into it to express and realise a higher law of Nature and therefore a higher system of the lines of Karma. The mental energy divides itself and runs in many directions, has an ascending scale of the levels of its action, a great variety and combination of its dynamic aims and purposes. There are many strands of its weaving and it follows each along its own line and combines manifoldly the threads of one with the threads of another. There is in it an energy of thought that puts itself out for a return and a constant increase of knowledge, an energy of will that casts itself forth for a return and increase of conscious mastery, fulfilment of the being, execution of will in action, an energy of conscious aesthesis that feels out for a return and an increase of the creation and enjoyment of beauty, an energy of emotion that demands in its action a return and a constant increase of the enjoyment and satisfaction of the emotional power of the being. All these energies act in a way for themselves and yet depend upon and are inextricably accompanied and mingled with each other. At the same time mind has descended into matter and has to act in and through this world of the vital and physical energy and to consent to and make something of the lines of the vital and physical Karma.

Man, then, since he is a mental being, a means of the evolution of the mental self-expression of the spirit, cannot confine the rule of his action and nature to an obedience to the vital and physical law and an intelligent utilisation of it for the greater, more ordered, more perfect enjoyment of his vital and physical existence, perpetuation, reproduction, possession, enjoyment, expansion. There is a higher law of mental being and nature of which he is bound to become aware and to seek to impose it on his life and his action. At first he is very predominantly governed by the life needs and the movement of the life energies, and it is in applying his mental energy to them and to the world around him that he makes the earliest development of his powers of
knowledge and will and trains the crude impulses that lead him into the path of his emotional, aesthetic and moral evolution. But always there is a certain obscure element that takes pleasure in the action of the mental energies for their own sake and it is this, however imperfect at first in self-consciousness and intelligence, that represents the characteristic intention of Nature in him and makes his mental and eventually his spiritual evolution inevitable. The insistence of the external world around him and the need of utilising its opportunities and of meeting its siege and dangers causes his mind to be much obsessed by life and external action and the utility of thought and will and perception for his dealings with the physical and life forces, and to this preoccupation the finer more disinterested action and subtler cast of motive of the mind nature demanding its own inner development, seeking for knowledge, mastery, beauty, a purer emotional delight for their own sake, and the pursuits which are characteristic of this higher energy of the mental nature, appear almost as by-products and at any rate things secondary that can always be postponed and made subordinate to the needs and demands of the mentalised vital and physical being. But the finer and more developed mind in humanity has always turned towards an opposite self-seeing, inclined to regard this as the most characteristic and valuable element of our being and been ready to sacrifice much and sometimes all to its calls or its imperative mandate. Then life itself would be in reality for man only a field of action for the evolution, the opportunity of new experience, the condition of difficult effort and mastery of the mental and spiritual being. What then will be the lines of this mental energy and how will they affect and be affected by the lines of the vital and physical Karma?

Three movements of the mental energy of man projecting itself along the lines of life, successive movements that yet overlap and enter into each other, have created a triple strand of the law of his Karma. The first is that, primary, obvious, universal, predominant in his beginnings, in which his mind subjects and assimilates itself to the law of life in matter in order to make the most of the terrestrial existence for its own pleasure and profit,
artha, kāma, without any other modification or correction of its pre-existing lines than is involved in the very impact of the human intelligence, will, emotion, aesthesis. These indeed are forces that lift up and greatly enlarge and infinitely rarefy and subtilise by a consciously regulated and more and more skilful and curious use the first crude, narrow and essentially animal aims and movements common to all living creatures. And this element of the mentalised vital existence, these lines of its movement making the main grey solid stuff of the life of the average economic, political, social, domestic man may take on a great amplitude and an imposing brilliance, but they remain always in their distinctive, their original and still persistent character the lines of movement, the way of Karma of the thinking, willing, feeling, refining human animal, — not to be despised or excluded from our total way of being when we climb to a higher plane of conception and action, but still only a small part of human possibility and, if regarded as the main preoccupation or most imperative law of the human being, then limiting and degrading it; for, empowered up to a certain point to enlarge and dynamise and enrich, but not raise to a self-exceeding, they are useful for ascension only when themselves uplifted and transformed by a greater law and a nobler motive. The momentum of this energy may be a very powerful mental action, may involve much output of intelligence and will power and aesthetic perception and expenditure of emotional force, but the return it seeks is vital success and enjoyment and possession and satisfaction. The mind no doubt feeds its powers on the effort and its fullness on the prize, but it is tethered to its pasture. It is a mixed movement, mental in its means, predominantly vital in its returns; its standard of the values of the return are measured by an outward success and failure, an externalised or externally caused pleasure and suffering, good fortune and evil fortune, the fate of the life and the body. It is this powerful vital preoccupation which has given us one element of the current notion of law of Karma, its idea of an award of vital happiness and suffering as the measure of cosmic justice.

The second movement of mind running on the lines of life
comes into prominent action when man evolves out of his experience the idea of a mental rule, standard, ideal, a concretised abstraction which is suggested at first by life experience, but goes beyond, transcends the actual needs and demands of the vital energy and returns upon it to impose some ideal mental rule, some canon embodying a generalised conception of Right on the law of life. For its essence is the discovery or belief of the mind that in all things there is a right rule, a right standard, a right way of thought, will, feeling, perception, action other than that of the intuition of vital nature, other than that of the first dealings of mind seeking only to profit by the vital nature with a mainly vital motive, — for it has discovered a way of the reason, a rule of the self-governing intelligence. This brings into the seeking of vital pleasure and profit, artha, kāma, the power of the conception of a mental truth, justice, right, the conception of Dharma. The greater practical part of the Dharma is ethical, it is the idea of the moral law. The first mind movement is non-moral or not at all characteristically moral, has only, if at all, the conception of a standard of action justified by custom, the received rule of life and therefore right, or a morality indistinguishable from expediency, accepted and enforced because it was found necessary or helpful to efficiency, power, success, to victory, honour, approval, good fortune. The idea of Dharma is on the contrary predominantly moral in its essence. Dharma on its heights holds up the moral law in its own right and for its own sake to human acceptance and observance. The larger idea of Dharma is indeed a conception of the true law of all energies and includes a conscience, a rectitude in all things, a right law of thought and knowledge, of aesthesis, of all other human activities and not only of our ethical action. But yet in the notion of Dharma the ethical element has tended always to predominate and even to monopolise the concept of Right which man creates, — because ethics is concerned with action of life and his dealing with his vital being and with his fellow-men and that is always his first preoccupation and his most tangible difficulty, and because here first and most pressingly the desires, interests, instincts of the vital being find themselves cast into a
sharp and very successful conflict with the ideal of Right and the
demand of the higher law. Right ethical action comes therefore
to seem to man at this stage the one thing binding upon him
among the many standards raised by the mind, the moral claim
the one categorical imperative, the moral law the whole of his
Dharma.

At first however the moral conceptions of man and the
direction and output and the demand of return of the ethical
energy in him get themselves inextricably mixed with his vital
conceptions and demands and even afterwards lean on them very
commonly and very considerably for a support and incentive.
Human morality first takes up an enormous mass of customary
rules of action, a conventional and traditional practice much of
which is of a very doubtful moral value, gives to it an imperative
sanction of right and slips into the crude mass or superimposes
on it, but still as a part of one common and equal code, the true
things of the ethical ideal. It appeals to the vital being, his desires,
hopes and fears, incites man to virtue by the hope of rewards
and the dread of punishment, imitating in this device the method
of his crude and fumbling social practice: for that, finding its
law and rule which, good or bad, it wishes to make imperative
as supposing it to be at least the best calculated for the order
and efficiency of the community, opposed by man’s vital being,
bribes and terrifies as well as influences, educates and persuades
him to acceptance. Morality tells man, accommodating itself
to his imperfection, mostly through the mouth of religion, that
the moral law is imperative in itself, but also that it is very
expedient for him personally to follow it, righteousness in the
end the safest policy, virtue the best paymaster in the long run,—
for this is a world of Law or a world ruled by a just and virtuous
or at least virtue-loving God. He is assured that the righteous
man shall prosper and the wicked perish and that the paths of
virtue lie through pleasant places. Or, if this will not serve, since
it is palpably false in experience and even man cannot always
deceive himself, it offers him a security of vital rewards denied
here but conceded in some hereafter. Heaven and hell, happiness
and suffering in other lives are put before him as the bribe and
the menace. He is told, the better to satisfy his easily satisfied intellect, that the world is governed by an ethical law which determines the measure of his earthly fortunes, that a justice reigns and this is justice, that every action has its exact rebound and his good shall bring him good and his evil evil. It is these notions, this idea of the moral law, of righteousness and justice as a thing in itself imperative, but still needing to be enforced by bribe and menace on our human nature,—which would seem to show that at least for that nature they are not altogether imperative,—this insistence on reward and punishment because morality struggling with our first unregenerate being has to figure very largely as a mass of restraints and prohibitions and these cannot be enforced without some fact or appearance of a compelling or inducing outward sanction, this diplomatic compromise or effort at equivalence between the impersonal ethical and the personal egoistic demand, this marriage of convenience between right and vital utility, virtue and desire,—it is these accommodations that are embodied in the current notions of the law of Karma.

What real truth is there behind the current notions of Karma in the actual facts or the fundamental powers of the life of man here or the visible working of the law of the energies of the cosmos? There is evidently a substantial truth, but it is a part only of the whole; its reign or predominance belongs to a certain element only, to the emphasis of one line among many of a transitional movement between the law of the vital energy and a greater and higher law of the mind and spirit. A mixture of any two kinds of energy sets up a mixed and complex action of the output of the energy and the return, and a too sharp-cut rule affixing vital returns to a mental and moral output of force is open to much exception and it cannot be the whole inner truth of the matter. But still where the demand is for the vital return, for success, an outer happiness, good, fortune, that is a sign of the dominant intention in the energy and points to a balance of forces weighing in the indicated direction. At first sight, if success is the desideratum, it is not clear what morality has to say in the affair, since we see in most things that it is a right understanding
and intelligent or intuitive practice of the means and conditions and an insistent power of the will, a settled drive of the force of the being of which success is the natural consequence. Man may impose by a system of punishments a check on the egoistic will and intelligence in pursuit of its vital ends, may create a number of moral conditions for the world’s prizes, but this might appear, as is indeed contended in certain vitalistic theories, an artificial imposition on Nature and a dulling and impoverishment of the free and powerful play of the mind force and the life force in their alliance. But in truth the greatest force for success is a right concentration of energy, tapasyā, and there is an inevitable moral element in Tapasya.

Man is a mental being seeking to establish a control over the life forces he embodies or uses, and one condition of that mastery is a necessary self-control, a restraint, an order, a discipline imposed on his mental, vital and physical being. The animal life is automatically subjected to certain measures; it is the field of an instinctive vital Dharma. Man, liberated from these automatic checks by the free play of his mind, has to replace them by willed and intelligent restraints, an understanding measure, a voluntary discipline. Not only a powerful expenditure and free play of his energies, but also a right measure, restraint and control of them is the condition of his life’s success and soundness. The moral is not the sole element: it is not entirely true that the moral right always prevails or that where there is the dharma, on that side is the victory. The immediate success often goes to other powers, even an ultimate conquest of the Right comes usually by an association with some form of Might. But still there is always a moral element among the many factors of individual and collective or national success and a disregard of acknowledged right has at some time or other disastrous or fatal reactions. Moreover, man in the use of his energies has to take account of his fellows and the aid and opposition of their energies, and his relations with them impose on him checks, demands and conditions which have or evolve a moral significance. There is laid on him almost from the first a number of obligations even in the pursuit of vital success and
satisfaction which become a first empirical basis of an ethical order.

And there are cosmic as well as human forces that respond to this balance of the mental and moral and the vital order. First there is something subtle, inscrutable and formidable that meets us in our paths, a Force of which the ancient Greeks took much notice, a Power that is on the watch for man in his effort at enlargement, possession and enjoyments and seems hostile and opposite. The Greeks figured it as the jealousy of the gods or as Doom, Necessity, Ate. The egoistic force in man may proceed far in its victory and triumph, but it has to be wary or it will find this power there on the watch for any flaw in his strength or action, any sufficient opportunity for his defeat and downfall. It dogs his endeavour with obstacle and reverse and takes advantage of his imperfections, often dallying with him, giving him long rope, delaying and abiding its time, — and not only of his moral shortcomings but of his errors of will and intelligence, his excesses and deficiencies of strength and prudence, all defects of his nature. It seems overcome by his energies of Tapasya, but it waits its season. It overshadows unbroken or extreme prosperity and often surprises it with a sudden turn to ruin. It induces a security, a self-forgetfulness, a pride and insolence of success and victory and leads on its victim to dash himself against the hidden seat of justice or the wall of an invisible measure. It is as fatal to a blind self-righteousness and the arrogations of an egoistic virtue as to vicious excess and selfish violence. It appears to demand of man and of individual men and nations that they shall keep within a limit and a measure, while all beyond that brings danger; and therefore the Greeks held moderation in all things to be the greatest part of virtue.

There is here something in the life forces obscure to us, considered by our partial feelings sinister because it crosses our desires, but obedient to some law and intention of the universal mind, the universal reason or Logos which the ancients perceived at work in the cosmos. Its presence, when felt by the cruder kind of religious mind, generates the idea of calamity as a punishment for sin, — not observing that it has a punishment
too for ignorance, for error, stupidity, weakness, defect of will and tapasya. This is really a resistance of the Infinite acting through life against the claim of the imperfect ego of man to enlarge itself, possess, enjoy and have, while remaining imperfect, a perfect and enduring happiness and complete felicity of its world-experience. The claim is, we may say, immoral, and the Force that resists it and returns, however uncertainly and late to our eyes, suffering and failure as a reply to our imperfections, may be considered a moral Force, an agent of a just Karma, though not solely in the narrowly ethical sense of Karma. The law it represents is that our imperfections shall have their passing or their fatal consequences, that a flaw in our output of energy may be mended or counterbalanced and reduced in consequence, but if persisted in shall react even in excess of its apparent merits, that an error may seem to destroy all the result of the Tapasya, because it springs from a radical unsoundness in the intention of the will, the heart, the ethical sense or the reason. This is the first line of the transitional law of Karma.

A second line of Karmic response of the cosmic forces to our action puts on also an appearance which tempts us to give it a moral character. For there can be distinguished in Nature a certain element of the law of the talion or — perhaps a more appropriate figure, since this action seems rather mechanical than rational and deliberate — a boomerang movement of energy returning upon its transmitter. The stone we throw is flung back by some hidden force in the world life upon ourselves, the action we put out upon others recoils, not always by a direct reaction, but often by devious and unconnected routes, on our own lives and sometimes, though that is by no means a common rule, in its own exact figure or measure. This is a phenomenon so striking to our imagination and impressive to our moral sense and vital feelings that it has received some kind of solemn form and utterance in the thought of all cultures, — “What thou hast done, thou must suffer”, “He that uses the sword shall perish by the sword”; “Thou hast sown the wind and thou shalt reap the whirlwind”; — and we are tempted to erect it into a universal rule and accept it as sufficient evidence of a moral order. But the
careful thinker will pause long before he hastens to subscribe to any such conclusion, for there is much that militates against it and this kind of definite reaction is rather exceptional than an ordinary rule of human life. If it were a regular feature, men would soon learn the code of the draconic impersonal legislator and know what to avoid and the list of life’s prohibitions and vetoes. But there is no such clear penal legislation of Nature.

The mathematical precision of physical Nature’s action and reaction cannot indeed be expected from mental and vital Nature. For not only does everything become infinitely more subtle, complex and variable as we rise in the scale so that in our life action there is an extraordinary intertwining of forces and mixture of many values, but, even, the psychological and moral value of the same action differs in different cases, according to the circumstance, the conditions, the motive and mind of the doer. The law of the talion is no just or ethical rule when applied by man to men and, applied by superhuman dispenser of justice or impersonal law with a rude rule of thumb to the delicate and intricate tangle of man’s life action and life motives, it would be no better. And it is evident too that the slow, long and subtle purposes of the universal Power working in the human race would be defeated rather than served by any universality of this too precise and summary procedure. Accordingly we find that its working is occasional and intermittent rather than regular, variable and to our minds capricious rather than automatic and plainly intelligible.

At times in the individual’s life the rebound of this kind of Karma is decisively, often terribly clear and penal justice is done, although it may come to him in an unexpected fashion, long delayed and from strange quarters; but however satisfactory to our dramatic sense, this is not the common method of retributive Nature. Her ways are more tortuous, subtle, unobtrusive and indecipherable. Often it is a nation that pays in this way for past crimes and mistakes and the sign manual of the law of the talion is there to point the lesson, but individually it is the innocent who suffer. A commercially minded king of Belgium is moved to make a good thing of the nation’s rubber estate and human
cattle farm in Africa and his agents murder and mutilate and immolate thousands of cheap negro lives to hasten the yield and swell his coffers. This able monarch dies in the splendour of riches and the sacred odour of good fortune, his agents in no way suffer: but here of a sudden comes Germany trampling her armed way towards a dream of military and commercial empire through prosperous Belgium and massacred men and women and mutilated children startlingly remind us of Karma and illustrate some obscure and capricious law of the talion. Here at least the nation in its corporate being was guilty of complicity, but at other times neither guilty individual nor nation is the payer, but perhaps some well-meaning virtuous blunderer gets the account of evil recompense that should have been paid in of rights by the strong despots before him who went on their way to the end rejoicing in power and splendour and pleasure.

It is evident that we cannot make much of a force that works out in so strange a fashion, however occasionally striking and dramatic its pointing at cause and consequence. It is too uncertain in its infliction of penalty to serve the end which the human mind expects from a system of penal justice, too inscrutably variable in its incidence to act as an indicator to that element in the human temperament which waits upon expediency and regulates its steps by a prudential eye to consequence. Men and nations continue to act always in the same fashion regardless of this occasional breaking out of the lightnings of a retaliatory doom, these occasional precisions of Karmic justice amidst the uncertainties of the complex measures of the universe. It works really not on the mind and will of man — except to some degree in a subtle and imperfect fashion on the subconscious mind — but outside him as a partial check and regulator helping to maintain the balance of the returns of energy and the life purposes of the world-spirit. Its action is like that of the first line of transitional Karma intended to prevent the success of the vital egoism of man and serves as an interim compression and compulsion until he can discover and succeed in spite of his vital self in obeying a higher law of his being and a purer dynamism of motive in his directing mind and governing spirit. It serves
therefore a certain moral purpose in the will in the universe, but is not itself, even in combination with the other, sufficient to be the law of a moral order.

A third possible and less outwardly mechanical line of Karma is suggested by the dictum that like creates like and in accordance with that law good must create good and evil must create evil. In the terms of a moral return or rather repayment to moral energies this would mean that by putting forth love we get a return of love and by putting forth hatred a return of hatred, that if we are merciful or just to others, others also will be to us just or merciful and that generally good done by us to our fellow-men will return in a recompense of good done by them in kind and posted back to our address duly registered in the moral post office of the administrative government of the universe. Do unto others as you would be done by, because then they will indeed so do to you, seems to be the formula of this moral device. If this were true, human life might indeed settle down into a very symmetrical system of a harmoniously moral egoism and a mercantile traffic in goodness that might seem fair and beautiful enough to those who are afflicted with that kind of moral aesthesis. Happily for the upward progress of the human soul, the rule breaks down in practice, the world-spirit having greater ends before it and a greater law to realise. The rule is true to a certain extent in tendency and works sometimes well enough and the prudential intelligence of man takes some account of it in action but it is not true all the way and all the time. It is evident enough that hatred, violence, injustice are likely to create an answering hatred, violence and injustice and that I can only indulge these propensities with impunity if I am sufficiently powerful to defy resistance or so long as I am at once strong enough and prudent enough to provide against their natural reactions. It is true also that by doing good and kindness I create a certain goodwill in others and can rely under ordinary or favourable circumstances not so much on gratitude and return in kind as on their support and favour. But this good and this evil are both of them movements of the ego and on the mixed egoism of human nature there can be no safe or
positive reliance. An egoistic selfish strength, if it knows what to do and where to stop, even a certain measure of violence and injustice, if it is strong and skilful, cunning, fraud, many kinds of evil, do actually pay in man’s dealing with man hardly less than in the animal’s with the animal, and on the other hand the doer of good who counts on a return or reward finds himself as often as not disappointed of his bargained recompense. The weakness of human nature worships the power that tramples on it, does homage to successful strength, can return to every kind of strong or skilful imposition belief, acceptance, obedience: it can crouch and fawn and admire even amidst movements of hatred and terror; it has singular loyalties and unreasoning instincts. And its disloyalties too are as unreasoning or light and fickle: it takes just dealing and beneficence as its right and forgets or cares not to repay. And there is worse; for justice, mercy, beneficence, kindness are often enough rewarded by their opposites and ill will an answer to goodwill is a brutally common experience. If something in the world and in man returns good for good and evil for evil, it as often returns evil for good and, with or without a conscious moral intention, good for evil. And even an unegoistic virtue or a divine good and love entering the world awakens hostile reactions. Attila and Jenghiz on the throne to the end, Christ on the cross and Socrates drinking his portion of hemlock are no very clear evidence for any optimistic notion of a law of moral return in the world of human nature.

There is little more sign of its sure existence in the world measures. Actually in the cosmic dispensation evil comes out of good and good out of evil and there seems to be no exact correspondence between the moral and the vital measures. All that we can say is that good done tends to increase the sum and total power of good in the world and the greater this grows the greater is likely to be the sum of human happiness and that evil done tends to increase the sum and total power of evil in the world and the greater this grows, the greater is likely to be the sum of human suffering and, eventually, man or nation doing evil has in some way to pay for it, but not often in any
intelligibly graded or apportioned measure and not always in clearly translating terms of vital good fortune and ill fortune.

In short, what we may call the transitional lines of Karma exist and have to be taken into account in our view of the action of the world forces. But they are not and cannot be the whole law of Karma. And they cannot be that because they are transitional, because good and evil are moral and not vital values and have a clear right only to a moral and not a vital return, because reward and punishment put forward as the conditions of good doing and evil doing do not constitute and cannot create a really moral order, the principle itself, whatever temporary end it serves, being fundamentally immoral from the higher point of view of a true and pure ethics, and because there are other forces that count and have their right, — knowledge, power and many others. The correspondence of moral and vital good is a demand of the human ego and like many others of its demands answers to certain tendencies in the world mind, but is not its whole law or highest purpose. A moral order there can be, but it is in ourselves and for its own sake that we have to create it and, only when we have so created it and found its right relation to other powers of life, can we hope to make it count at its full value in the right ordering of man’s vital existence.
The Higher Lines of Karma

THE THIRD movement of mind labours to bring the soul of man out of the tangle of the vital and mental forces and opens to him a field in which the mind raises itself, raises at least the head of its thought and will, above the vital demands and standards and there at that top of its activities, whatever its other concessions to the lower Karma, lives for the sake of the true values, the true demands of a mental being, even though one imprisoned in a body and set to wrestle with the conditions of life in a material universe. The innate demand of the mental being is for mental experience, for the mind's manifold strengths, its capacities, joys, growth, perfections, and for these things for their own sake because of the inevitable satisfaction they give to his nature,—the demand of the intellect for truth and knowledge, the demand of the ethical mind for right and good, the demand of the aesthetic mind for beauty and delight of beauty, the demand of the emotional mind for love and the joy of relation with our fellow-beings, the demand of the will for self-mastery and mastery of things and the world and our existence. And the values which the mental being holds for supreme and effective are the values of truth and knowledge, of right and good, of beauty and aesthetic delight, of love and emotional joy, of mastery and inner lordship. It is these things that he seeks to know and follow, to possess, discover, enjoy, increase. It is for this great adventure that he came into the world, to walk hardily through the endless fields they offer to him, to experiment, to dare, to test the utmost limit of each capacity and follow each possibility and its clue to the end as well as to observe in each its at present discovered law and measure. Here as in the other fields, as in the vital and physical, so in his mental provinces, it is the appointed work of his intelligence and will to know and master through an always enlarging experience the conditions
of an increasing light and power and right and truth and joy and beauty and wideness, and not only to discover the Truth and the Law and set up a system and an order, but to enlarge continually its lines and boundaries. And therefore in these fields, as in life, man, the mental being, cannot stop short too long in the partial truth of an established system and a temporary mistaken for an eternal order — here least, because as he advances he is always tempted still farther forward until he realises that he is a seeker of the infinite and a power of the absolute. His base here plunges into the obscure infinite of life and matter; but his head rises towards the luminous infinite of the spirit.

The third movement of the mental energy carries it therefore into its own native field and kingdom above the pressing subjection to the lowering and limiting claim of a vital and physical Karma. It is true that his lower being remains subject to the law of life and of the body, and it is true also that he must strive either to find in life or to bring into the world around him some law of truth, of right and good, of beauty, of love and joy, of the mind’s will and mastery, for it is by that effort that he is man and not the animal and without it he cannot find his true satisfaction in living. But two things he has more and more to feel and to realise, first, that life and matter follow their own law and not, in man’s sense of it at least, a moral, a rational, a mentally determined aesthetic or other mind order, and if he wishes to introduce any such thing into them, he must himself here create it, transcending the physical and the vital law and discovering another and a better, and secondly, that the more he follows these things for their own sake, the more he discovers their true form, svarūpa, and develops their force to prevail upon and lift up life into an air of higher nature. In other words he passes from the practical pursuit of a serviceable knowledge, morality, aethesis, force of emotion and will-power, — serviceable for his vital aims, for life as it first is, — to an ideal pursuit of these things and the transformation of life into the image of his ideal. This he is unable indeed as yet to realise and is obliged to rest on balance and compromise, because he has not found the whole reconciling secret of that which lies beyond his ideals. But it is as
he pursues them in their purity, for their own imperative innate
demand and attraction, on the line of their trend to their own
infinite and absolute that he gets nearer in his total experience
to the secret. There is so a chance of his discovering that as the
beauty and irrefragable order of life and matter are due to the
joy of the Infinite in life and in matter and the fidelity of the
Force here at work to the hidden knowledge and will and idea
of the Self and Spirit in them, so there is within his own hidden
self, his own vast and covert spirit a secret of the Infinite’s self-
knowledge, will, joy, love and delight, mastery, right and truth
of joy and action by which his own greater life rising above the
vital and mental limitations can discover an infinite perfection
and beauty and delight in itself and spontaneous irrefragable
order.

Meanwhile this third movement of mind discovers a law of
the return of mental energies, pure in its kind and as certain
as the vital and the physical, as faithful to itself, to the self of
mind and to mind nature, a law not of vital returns to mental
dynamis, but of progression of the soul in the being and force of
good and beauty and power — of mind-power and soul-power
— and greatness and love and joy and knowledge. Mounting
here the ethical mind no longer follows good for a reward now
on earth or in another existence, but for the sake of good, and
no longer shuns evil for fear of punishment on earth later on in
this life or else in another life or in hell, but because to follow
evil is a degradation and affliction of its being and a fall from
its innate and imperative endeavour. This is to it a necessity of
its moral nature, a truly categorical imperative, a call that in the
total more complex nature of man may be dulled or suppressed
or excluded by the claim of its other parts and their needs, but
to the ethical mind is binding and absolute. The virtue that
demands a reward for acting well and needs a penalty to keep
it walking in the straight way, is no real portion, no true law
of the ethical being, but rather a mixed creation, a rule of his
practical reason that seeks always after utility and holds that to
be right which is helpful and expedient, a rule that looks first
not at the growth of the soul but at the mechanical securing of
a regulated outward conduct and to secure it bribes and terrifies
the vital being into acquiescence and a reluctant subordination
of its own instincts and natural ventures. The virtue so created is
an expediency, a social decency, a prudent limitation of egoism,
a commercial substitute for the true thing; or, at best, it is a
habit of the mind and not a truth of the soul, and in the mind
a fabrication, mixed and of inferior stuff, a conventional virtue,
insecure, destructible by the wear and tear of life, easily con-
fused with other expediencies or purchasable or conquerable by
them, — it is not a high and clear upbuilding, an enduring and
inwardly living self-creation of the soul. Whatever its practical
utility or service as a step of the transition, the mental habit
of confusion and vitalistic compromise it fosters and the more
questionable confusions and compromises that habit favours,
have made conventional morality one of the chief of the forces
that hold back human life from progressing to a true ethical
order. If humanity has made any lasting and true advance, it has
been not through the virtue created by reward and punishment
or any of the sanctions powerful on the little vital ego, but by
an insistence from the higher mind on the lower, an insistence
on right for its own sake, on imperative moral values, on an
absolute law and truth of ethical being and ethical conduct that
must be obeyed whatever the recalcitrances of the lower mind,
whatever the pains of the vital problem, whatever the external
result, the inferior issue.

This higher mind holds its pure and complete sway only
on a few high souls, in others it acts upon the lower and outer
mind but amidst much misprision, confusion and distortion of
thought and will and perverting or abating mixture; on the mass
of men governed by the lower egoistic, vital and conventional
standards of conduct its influence is indirect and little. None
the less it gives the clue we have to follow in order to pursue
the spiral ascent of the lines of Karma. And first we observe
that the just man follows the ethical law for its own sake and
not for any other purpose whatsoever, is just for the sake of
justice, righteous for the sake of righteousness, compassionate
for the sake of compassion, true for the sake of truth alone.
Harishchandra sacrificing self and wife and child and kingdom and subjects in an unswerving fidelity to the truth of the spoken word, Shivi giving his flesh to the hawk rather than fall from his kingly duty of protection to the fugitive, the Bodhisattwa laying his body before the famished tiger, images in which sacred or epic legend has consecrated this greater kind of virtue, illuminate an elevation of the ethical will and a law of moral energy that asks for no return from man or living thing or from the gods of Karma, lays down no conditions, makes no calculation of consequence, of less or more or of the greatest good of the greatest number, admits neither the hedonistic nor the utilitarian measure, but does simply the act as the thing to be done because it is right and virtue and therefore the very law of being of the ethical man, the categorical imperative of his nature.

This kind of high absoluteness in the ethical demand is appalling to the flesh and the ego, for it admits of no comfortable indulgence and compromise, no abating reserves or conditions, no profitable compact between the egoistic life and virtue. It is offensive too to the practical reason, for it ignores the complexity of the world and of human nature and seems to savour of an extremism and exclusive exaggeration as dangerous to life as it is exalted in ideal purpose. *Fiat justitia ruat coelum*, let justice and right be done though the heavens fall, is a rule of conduct that only the ideal mind can accept with equanimity or the ideal life tolerate in practice. And even to the larger ideal mind this absoluteness becomes untrustworthy if it is an obedience not to the higher law of the soul, but to an outward moral law, a code of conduct. For then in place of a lifting enthusiasm we have the rigidity of the Pharisee, a puritan fierceness or narrowness or the life-killing tyranny of a single insufficient side of the nature. This is not yet that higher mental movement, but a straining towards it, an attempt to rise above the transitional law and the vitalistic compromise. And it brings with it an artificiality, a tension, a coercion, often a repellent austerity which, disregarding as it does sanity and large wisdom and the simple naturalness of the true ethical mind and the flexibilities of life, tyrannising over but not transforming it, is not the higher perfection of our
nature. But still even here there is the feeling out after a great return to the output of moral energy, an attempt well worth making, if the aim can indeed so be accomplished, to build up by the insistence on a rigid obedience to a law of moral action that which is yet non-existent or imperfectly existent in us but which alone can make the law of our conduct a thing true and living, — an ethical being with an inalienably ethical nature. No rule imposed on him from outside, whether in the name of a supposed mechanical or impersonal law or of God or prophet, can be, as such, true or right or binding on man: it becomes that only when it answers to some demand or aids some evolution of his inner being. And when that inner being is revealed, evolved, at each moment naturally active, simply and spontaneously imperative, then we get the true, the inner and intuitive Law in its light of self-knowledge, its beauty of self-fulfilment, its intimate life significance. An act of justice, truth, love, compassion, purity, sacrifice becomes then the faultless expression, the natural outflowering of our soul of justice, our soul of truth, our soul of love and compassion, our soul of purity or sacrifice. And before the greatness of its imperative mandate to the outer nature the vital being and the practical reason and surface seeking intelligence must and do bow down as before something greater than themselves, something that belongs directly to the divine and the infinite.

Meanwhile we get the clue to the higher law of Karma, of the output and returns of energy, and see it immediately and directly to be, what all law of Karma, really and ultimately, if at first covertly, is for man, a law of his spiritual evolution. The true return to the act of virtue, to the ethically right output of his energy — his reward, if you will, and the sole recompense on which he has a right to insist, — is its return upon him in a growth of the moral strength within him, an upbuilding of his ethical being, a flowering of the soul of right, justice, love, compassion, purity, truth, strength, courage, self-giving that he seeks to be. The true return to the act of evil, to the ethically wrong output of energy — his punishment, if you will, and the sole penalty he has any need or right to fear, — is its return upon
him in a retardation of the growth, a demolition of the upbuilding, an obscuration, tarnishing, impoverishing of the soul, of the pure, strong and luminous being that he is striving to be. An inner happiness he may gain by his act, the calm, peace, satisfaction of the soul fulfilled in right, or an inner calamity, the suffering, disturbance, unease and malady of its descent or failure, but he can demand from God or moral Law no other. The ethical soul, — not the counterfeit but the real, — accepts the pains and sufferings and difficulties and fierce intimidations of life, not as a punishment for its sins, but as an opportunity and trial, an opportunity for its growth, a trial of its built or native strength, and good fortune and all outer success not as a coveted reward of virtue, but as an opportunity also and an even greater more difficult trial. What to this high seeker of Right can mean the vital law of Karma or what can its gods do to him that he can fear or long for? The ethical-vitalistic explanation of the world and its meaning and measures has for such a soul, for man at this height of his evolution no significance. He has travelled beyond the jurisdiction of the Powers of the middle air, the head of his spirit’s endeavour is lifted above the dull grey-white belt that is their empire.

There can be no greater error than to suppose, misled by this absolute insistence of the ethical being, that the ethical is the single or the supreme demand of the Infinite upon us or the one law and line of the higher Karma, and that in comparison with it nothing else matters. The German thinker’s idea that there is a categorical imperative laid upon man to seek after the right and good, an insistent law of right conduct, but no categorical imperative of the Oversoul compelling him to seek after the beautiful or the true, after a law of right beauty and harmony and right knowledge, is a singular misprision. It is a false deduction born of too much preoccupation with the transitional movement of man’s mind and, there too, only with one side of its complex phenomena. The Indian thinkers had a wiser sight who while conceding right ethical being and conduct as a first need, still considered knowledge to be the greater ultimate demand, the indispensable condition, and much nearer to a full seeing
came that larger experience of theirs that either through an urge towards absolute knowledge or a pure impersonality of the will or an ecstasy of divine love and absolute delight,—and even through an absorbing concentration of the psychical and the vital and physical being,—the soul turns towards the Supreme and that on each part of our self and nature and consciousness there can come a call and irresistible attraction of the Divine. Indeed, an uplift of all these, an imperative of the Divine upon all the ways of our being, is the impetus of self-enlargement to a complete, an integralising possession of God, freedom and immortality, and that therefore is the highest law of our nature.

The fundamental movement of life knows nothing of an absolute ethical insistence, its only categorical imperative is the imperative of Nature herself compelling each being to affirm its life as it must or as best it can according to its own inborn self and way of expression of her, Swabhava. In the transitional movement of life informed by mind there is indeed a moral instinct developing into a moral sense and idea,—not complete for it leaves large ranges of conduct in which there is a lacuna or inconscience of the moral sense, a satisfied fulfilment of the egoistic desires at the expense of others, and not imperative since it is easily combated and overthrown by the earlier imposed, more naturally dominant law of the vital being. What the natural egoistic man obeys most rigorously is the collective or social rule of conduct impressed on his mind by law and tradition, _jus_, _mores_, and outside its conventional circle he allows himself an easy latitude. The reason generalises the idea of a moral law carrying with it an obligation man should heed and obey but may disregard at this outer or that inner peril, and it insists first and most on a moral law, an obligation of self-control, justice, righteousness, conduct, rather than a law of truth, beauty and harmony, love, mastery, because the regulation of his desires and instincts and his outward vital action is his first necessary preoccupation and he has to find his poise here and a settled and sanctioned order before he commences securely to go deeper and develop more in the direction of his inner being. It is the ideal mind that brings into this superficial moral sense, this
relative obligation, the intuition of an inner and absolute ethical imperative, and if it tends to give to ethics the first and most important and in some minds the whole place, it is still because the priority of action, long given to it in the evolution of mind on earth, moves man to apply first his idealism to action and his relations with other beings. But as there is the moral instinct in the mind seeking for good, so too there is the aesthetic instinct, the emotional and the dynamic and the instinct in man that seeks after knowledge, and the developing reason is as much concerned to evolve in all these directions as in the ethical and to find out their right law; for truth, beauty, love, strength and power are after all as necessary for the true growth of mind and of life and even for the fullness of the action as righteousness, purity and justice. Arriving on the high ideal plane these too become, no less than the ethical motive, no longer a seeking and necessity of this relative nature and importance, but a law and call to spiritual perfection, an inner and absolute divine imperative.

The higher mind of man seeks not only after good, but after truth, after knowledge. He has an intellectual as well as an ethical being and the impulse that moves it, the will to know, the thirst for truth is not less divine in its upward orientation than the will to good, not less too in its earlier workings, but even more, a necessity of the growth of our consciousness and being and the right ordering of our action, not less an imperative need laid upon man by the will of the spirit in the universe. And in the pursuit of knowledge as in the pursuit of good we see the same lines and stages of the evolution of energy. At first as its basis there is simply a life-consciousness seeking for its self, becoming more and more aware of its movements, actions and reactions, its environment, its habits, its fixed laws, gaining and enlarging and learning always to profit by self-experience. This is indeed the fundamental purpose of consciousness and use of intelligence, and intelligence with the thinking will in it is man’s master faculty and supports and embraces, changes with its change and widens with its widening and increasingly perfects all the others. Mind in its first action pursues knowledge with a
certain curiosity, but turns it mainly to practical experience, to a help that enables it to fulfil better and to increase more assuredly the first uses and purposes of life. Afterwards it evolves a freer use of the intelligence, but there is still a dominant turn towards the vital purpose. And we may observe that as a power for the returns of life the world energy seems to attach a more direct importance and give more tangible results to knowledge, to the right practical workings of the intelligence than it yields to moral right. In this material world it is at least doubtful how far moral good is repaid by vital good and moral evil punished by a recoil, but it is certain that we do pay very usually for our errors, for stupidity, for ignorance of the right way of action, for any ignoring or misapplication of the laws that govern our psychical, vital and physical being; it is certain that knowledge is a power for life efficiency and success. Intelligence pays its way in the material world, guards itself against vital and physical suffering, secures its vital rewards more surely than moral right and ethical purpose.

But the higher mind of humanity is no more content with a utilitarian use of knowledge as its last word in the seeking of the intelligence than with a vitalistic and utilitarian turn and demand of the ethical being. As in the ethical, so in the intellectual being of man there emerges a necessity of knowledge which is no longer its utility for life, its need of knowing rightly in order to act rightly, to deal successfully and intelligently with the world around it, but a necessity of the soul, an imperative demand of the inner being. The pursuit of knowledge for the sake of knowledge is the true, the intrinsic dharma of the intellect and not for the sake primarily or even necessarily at all for the securing or the enlargement of the means of life and success in action. The vital kinetic man tends indeed to regard this passion of the intellect as a respectable but still rather unpractical and often trivial curiosity: as he values ethics for its social effects or for its rewards in life, so he values knowledge for its external helpfulness; science is great in his eyes because of its inventions, its increase of comforts and means and appliances: his standard in all things is vital efficiency. But in fact Nature sees and stirs from the first
to a larger and more inward Will and is moved with a greater purpose, and all seeking for knowledge springs from a necessity of the mind, a necessity of its nature, and that means a necessity of the soul that is here in nature. Its need to know is one with its need to grow, and from the eager curiosity of the child upward to the serious stress of mind of the thinker, scholar, scientist, philosopher the fundamental purpose of Nature, the constant in it, is the same. All the time that she seems busy only with the maintenance of her works, with life, with the outward, her secret underlying purpose is other,—it is the evolution of that which is hidden within her: for if her first dynamic word is life, her greater revealing word is consciousness and the evolution of life and action only the means of the evolution of the consciousness involved in life, the imprisoned soul, the Jiva. Action is a means, but knowledge is the sign and the growth of the conscious soul is the purpose. Man’s use of the intelligence for the pursuit of knowledge is therefore that which distinguishes him most from other beings and gives him his high peculiar place in the scale of existence. His passion for knowledge, first world-knowledge, but afterwards self-knowledge and that in which both meet and find their common secret, God-knowledge, is the central drift of his ideal mind and a greater imperative of his being than that of action, though later in laying its complete hold on him, greater in the wideness of its reach and greater too in its effectiveness upon action, in the returns of the world energy to his power of the truth within him.

It is in the third movement of highest mind when it is preparing to disengage itself, its pure self of will and intelligence, the radiant head of its endeavour from subjection to the vital motive that this imperative of nature, this intrinsic need that creates in the mind of man the urge towards knowledge, becomes something much greater, becomes instead more and more plainly the ideal absolute imperative of the soul emerging from the husks and sheaths of ignorance and pushing towards the truth, towards the light as the condition of its fulfilment and the very call of the Divine upon its being. The lure of an external utility ceases to be at all needed as an incentive towards
knowledge, just as the lure of a vital reward offered now or hereafter ceases on the same high level of our ascent to be needed as an incentive to virtue, and to attach importance to it under whatever specious colour is even felt to be a degradation of the disinterestedness, a fall from the high purity of the soul motive. Already even in the more outward forms of intellectual seeking something of this absoluteness begins to be felt and to reign. The scientist pursues his discoveries in order that he may know the law and truth of the process of the universe and their practical results are only a secondary motive of the enquiring mind and no motive at all to the higher scientific intelligence. The philosopher is driven from within to search for the ultimate truth of things for the one sake of Truth only and all else but to see the very face of Truth becomes to him, to his absorbing mind and soul of knowledge, secondary or of no importance; nothing can be allowed to interfere with that one imperative. And there is the tendency to the same kind of exclusiveness in the interest and the process of this absolute. The thinker is concerned to seek out and enforce the truth on himself and the world regardless of any effect it may have in disturbing the established bases of life, religion, ethics, society, regardless of any other consideration whatsoever: he must express the word of the Truth whatever its dynamic results on life. And this absolute becomes most absolute, this imperative most imperative when the inner action surpasses the strong coldness of intellectual search and becomes a fiery striving for truth experience, a luminous inner truth living, a birth into a new truth consciousness. The enamoured of light, the sage, the Yogin of knowledge, the seer, the Rishi live for knowledge and in knowledge, because it is the absolute of light and truth that they seek after and its claim on them is single and absolute.

At the same time this also is a line of the world energy,—for the world Shakti is a Shakti of consciousness and knowledge and not only a Power of force and action,—and the output of the energy of knowledge brings its results as surely as the energy of the will seeking after success in action or after right ethical conduct. But the result that it brings on this higher plane of the
seeking in mind is simply and purely the upward growth of the soul in light and truth; that and whatever happiness it brings is the one supreme reward demanded by the soul of knowledge and the darkening of the light within, the pain of the fall from truth, the pain of the imperfection of not living only by its law and wholly in the light is its one penalty of suffering. The outward rewards and the sufferings of life are small things to the higher soul of knowledge in man: even his high mind of knowledge will often face all that the world can do to afflict it, just as it is ready to make all manner of sacrifices in the pursuit and the affirmation of the truth it knows and lives for. Bruno burning in the Roman fire, the martyrs of all religions suffering and welcoming as witnesses to the light within them torture and persecution, Buddha leaving all to discover the dark cause of universal suffering in this world of the impermanence and the way of escape into the supreme Permanence, the ascetic casting away as an illusion life in the world and its activities, enjoyments, attractions with the one will to enter into the absolute truth and the supreme consciousness are witnesses to this imperative of knowledge, its extreme examples and exponents.

The intention of Nature, the spiritual justification of her ways appears at last in this turn of her energies leading the conscious soul along the lines of truth and knowledge. At first she is physical Nature building her firm field according to a base of settled truth and law but determined by a subconscious knowledge she does not yet share with her creatures. Next she is Life growing slowly self-conscious, seeking out knowledge that she may move seeingly in them along her ways and increase at once the complexity and the efficacy of her movements, but developing slowly too the consciousness that knowledge must be pursued for a higher and purer end, for truth, for the satisfaction, as the life expression and as the spiritual self- finding of the soul of knowledge. But, last, it is that soul itself growing in the truth and light, growing into the absolute truth of itself which is its perfection, that becomes the law and high end of her energies. And at each stage she gives returns according to the development of the aim and consciousness of the being. At first there is the
return of skill and effectual intelligence — and her own need explains sufficiently why she gives the rewards of life not, as the ethical mind in us would have it, to the just, not chiefly to moral good, but to the skilful and to the strong, to will and force and intelligence, — and then, more and more clearly disengaged, the return of enlightenment and the satisfaction of the mind and the soul in the conscious use and wise direction of its powers and capacities and, last of all, the one supreme return, the increase of the soul in light, the satisfaction of its perfection in knowledge, its birth into the highest consciousness and the pure fulfilment of its own innate imperative. It is that growth, a divine birth or spiritual self-exceeding its supreme reward, which for the Eastern mind has been always the highest gain, — the growth out of human ignorance into divine self-knowledge.
OBVIOUSLY we must leave far behind us the current theory of Karma and its shallow attempt to justify the ways of the Cosmic Spirit by forcing on them a crude identity with the summary notions of law and justice, the crude and often savagely primitive methods of reward and punishment, lure and deterrent dear to the surface human mind. There is here a more authentic and spiritual truth at the base of Nature’s action and a far less mechanically calculable movement. Here is no rigid and narrow ethical law bound down to a petty human significance, no teaching of a child soul by a mixed system of blows and lollipops, no unprofitable wheel of a brutal cosmic justice automatically moved in the traces of man’s ignorant judgments and earthy desires and instincts. Life and rebirth do not follow these artificial constructions, but a movement spiritual and intimate to the deepest intention of Nature. A cosmic Will and Wisdom observant of the ascending march of the soul’s consciousness and experience as it emerges out of subconscient Matter and climbs to its own luminous divinity fixes the norm and constantly enlarges the lines of the law—or, let us say, since law is a too mechanical conception, —the truth of Karma.

For what we understand by law is a single immutably habitual movement or recurrence in Nature fruitful of a determined sequence of things and that sequence must be clear, precise, limited to its formula, invariable. If it is not that, if there is too much flexibility of movement, if there intervenes too embarrassing a variety or criss-cross of action and reaction, a too rich complex of forces, the narrow uncompromising incompetence of our logical intelligence finds there not law but an incertitude and a chaos. Our reason must be allowed to cut and hew and arbitrarily select its suitable circumstances, isolate its immutable
data, skeletonise or mechanise life; otherwise it stands open-mouthed at a loss unable to think with precision or act with effect in a field of subtle and indefinite measures. It must be allowed to deal with mighty Nature as it deals with human society, politics, ethics, conduct; for it can understand and do good work only where it is licensed to build and map out its own artificial laws, erect a clear, precise, rigid, infallible system and leave as little room as possible for the endless flexibility and variety and complexity that presses from the Infinite upon our mind and life. Moved by this need we endeavour to forge for our own souls and for the cosmic Spirit even such a single and inflexible law of Karma as we would ourselves have made, had the rule of the world been left to us. Not this mysterious universe would we have made, but the pattern of a rational cosmos fitted to our call for a simple definite guidance in action and for a well-marked thumb rule facile and clear to our limited intelligence. But this force we call Karma turns out to be no such precise and invariable mechanism as we hoped; it is rather a thing of many planes that changes its face and walk and very substance as it mounts from level to higher level, and on each plane even it is not one movement but an indefinite complex of many spiral movements hard enough for us to harmonise together or to find out whatever secret harmony unknown to us and incalculable these complexities are weaving out in this mighty field of the dealings of the soul with Nature.

Let us then call Karma no longer a Law, but rather the many-sided dynamic truth of all action and life, the organic movement here of the Infinite. That was what the ancient thinkers saw in it before it was cut and shredded by lesser minds and turned into an easy and misleading popular formula. Action of Karma follows and takes up many potential lines of the spirit into its multitudinous surge, many waves and streams of combining and disputing world-forces; it is the processus of the creative Infinite; it is the long and multiform way of the progression of the individual and the cosmic soul in Nature. Its complexities cannot be unravelled by our physical mind ever bound up in the superficial appearance, nor by our vital mind of desire stumbling
forward in the cloud of its own instincts and longings and rash
determinations through the maze of these myriad favouring and
opposing forces that surround and urge and drive and hamper
us from the visible and invisible worlds. Nor can it be perfectly
classified, accounted for, tied up in bundles by the precisions
of our logical intelligence in its inveterate search for clear-cut
dogmas. On that day only shall we perfectly decipher what is
now to us Nature’s obscure hieroglyph of Karma when there
rises in our enlarged consciousness the supramental way of
knowledge. The supramental eye can see a hundred meeting and
diverging motions in one glance and envelop in the largeness of
its harmonising vision of Truth all that to our minds is clash and
opposition and the collision and interlocked strife of numberless
contending truths and powers. Truth to the supramental sight is
at once single and infinite and the complexities of its play serve
to bring out with an abundant ease the rich significance of the
Eternal’s many-sided oneness.

The complexity of the lines of Karma is much greater than
we have yet seen in the steps of thought that we have been
obliged to cut in order to climb to the summits where they
converge. For the convenience of the mind we have chosen to
speak as if there were four quite separate planes each with its
separate lines of Karma,—the physical with its fixed law and
very easily perceptible return to our energies, the life plane,
complex, full of doubtful rewards and dangerous rebounds,
rich promise and dark menace, the mind plane with its high
trenchant unattainable absolutes each in its separateness so dif-
ficult to embody and all so hard to reconcile and combine and
the supramental where Nature’s absolutes are reached, her rel-
avities ordered to their place and all these lower movements
delivered and harmonised because they have found luminously
their inner spiritual reason for existence. That division is not
false in itself, but its truth is subject to two capital provisos
which at once give them a complexity not apparent in the first
formula. There are above and behind our human existence the
four levels but there each plane contains in itself the others,
although in each these others are subject to the dominant law
of the plane,—life for instance obeys on the mental level the
law of mind and turns its movements into an instrumentation of
the free intelligence. Again man exists here in the body and the
physical world; he is open more or less to the vast movements
of a life plane and the free movements of a mental world that
are far vaster and freer in their potentialities than anything that
we call here life and mind, but he does not live in that free
mental light or in that vast vital force. His business is to bring
down and embody here as much of that greater life and greater
mind as can be precipitated into matter and equipped with a
form and organised in the physical formula. In proportion as he
ascends he does indeed rise above the physical and vital into the
higher mental lines of Karma, but he cannot leave them entirely
behind him. The saint, the intellectual man, scientist, thinker
or creator, the seeker after beauty, the seeker after any mental
absolute is not that alone; he is also, even if less exclusively
than others, the vital and physical man; subject to the urgings
of the life and the body, he participates in the vital and physical
motives of Karma and receives the perplexed and intertwined
return of these energies. It is not intended in his birth that
he shall live entirely in mind, for he is here to deal with life
and Matter as well and to bring as best he can a higher law
into life and Matter. And since he is not a mental being in a
mental world, it is not easy and in the end, we may suspect,
not possible for him to impose entirely and perfectly the law
of the mental absolutes, a mental good, beauty, love, truth and
power on his lower parts. He has to take this other difficult
truth into account that life and Matter have absolutes of their
own armed with an equal right to formulation and persistence
and he has to find some light, some truth, some spiritual and
supramental power that can take up these imperatives also no
less than the mind’s imperatives and harmonise all in a grand
and integral transformation. But the difficulty is again that if he
is not open to the world of free intelligence, he is still less open
to the deeper and vaster spiritual and supramental levels. There
can indeed be great descents of spiritual light, purity, power,
love, delight into the earth consciousness in its human formula;
but man as he is now can hold only a little of these things and he can give them no adequate organisation and shape and body in his mental movements or his life-action or his physical and material consciousness and dynamis. The moment he tries to get at the absolute of the spirit, he feels himself obliged to reject body, to silence mind, and to draw back from life. It is that urgent necessity, that inability of mind and life and body to hold and answer to the spirit that is the secret of asceticism, the philosophical justification of the illusionist, the compulsion that moves the eremite and the recluse. If on the other hand he tries to spiritualise mind and life and the body he finds in the end that he has only brought down the spirit to a lower formulation that cannot give all its truth and purity and power. He has to some extent spiritualised mind, but much more has he mentalised the spiritual and to mentalise the spiritual is to falsify and obscure it or at the very least to dilute its truth, to imprison its force, to limit and alter its potentialities. He has perhaps to a much less extent spiritualised his life, but much more has he vitalised the spiritual and to vitalise the spiritual is to degrade it. He has never yet spiritualised the body, at most he has minimised the physical by a spiritual refusal and abstinence or brought down some mental and vital powers mistaken for spiritual into his physical force and physical frame. More has not been done in the human past so far as we can discover, or if anything greater was done it was a transitory gain from the superconscient and has returned again into our superconscience.

The secret reason of man’s failure to rise truly beyond himself is a fundamental incapacity in the mind, the life and the body to organise the highest integral truth and power of the spirit. And this incapacity exists because mind and life and matter are in their nature depressed and imperfect powers of the Infinite that need to be transformed into something greater than themselves before they can escape from their depression and imperfection; in their very nature they are a system of partial and separated values and cannot adequately express or embody the integral and the one, a movement of many divergent and mutually non-understanding or misunderstanding lines they cannot arrive
of themselves at any but a provisional, limited and imperfect harmony and order. There is no doubt a material Infinite, a vital Infinite, a mental Infinite in which we feel a perfection, a delight, an essential harmony, an inexpressible completeness which, when we experience it, makes us disregard the discords and imperfections and obscurities we see and even perceive them as elements of the infinite perfection. In other words the Spirit, the Infinite supports these depressed values and elicits from them a certain joy of his manifestation that is complete and illimitable enough in its own manner. But there is more behind and above, there are greater more unmistakably harmonious values, greater truly perfect powers of the Spirit than mind, life and matter and these wait for their expression and only when they are expressed can we escape from this system of harmony through discords and of a perfection on the whole that subsists by imperfection in the detail. And as we open to a greater knowledge, we find that even for such harmonies, stabilities, perfections as the energies of Mind, Life and Matter can realise, they depend really not on their own delegated and inferior power which is at best a more or less ignorant instrument but on a greater deeper organising force and knowledge of which they are the inadequate derivations. That force and knowledge is the self-possessed supramental power and will and the perfect and untrammelled supramental gnosis of the Infinite. It is that which has fixed the precise measures of Matter, regulates the motive instincts and impulsions of Life, holds together the myriad seekings of Mind; but none of these things are that power and gnosis and nothing therefore mental, vital or physical is final or can even find its own integral truth and harmony nor all these together their reconciliation until they are taken up and transformed in a supramental manifestation. For this supermind or gnosis is the entire organising will and knowledge of the spiritual, it is the Truth Consciousness, the Truth Force, the organic instrument-
In 1935, Sri Aurobindo was asked: “In ‘Rebirth and Karma’, second chapter,¹ I find that it is the ‘mental being’ which is put forth from life to life — that it is the reincarnating soul. But would not the mental being be a part of the personality — the mental, nervous and physical composite — which in the popular conception is the thing that is carried over or which takes a new body in the next life? And the ‘Self’ here is quite different from the ‘mental being’. . . . Is the ‘mental being’ then the same thing as the ‘psychic being’ which is carried over to the next life?”

The mental being spoken of by the Upanishad is not part of the mental-nervous-physical composite — it is the manomaya purusha prana-sharira-neta, the mental being leader of the life and body. It could not be so described if it were part of the composite. Nor can the composite or part of it be the Purusha, — for the composite is composed of Prakriti. It is described as manomaya by the Upanishads because the psychic being is behind the veil and man being a mental being in the life and body lives in his mind and not in his psychic, so to him the manomaya purusha is the leader of the life and body, — of the psychic behind supporting the whole he is not aware or dimly aware in his best moments. The psychic is represented in man by the Prime Minister, the manomaya, itself being a mild constitutional king; it is the manomaya to whom Prakriti refers for assent to her actions. But still the statement of the Upanishads gives only the apparent truth of the matter, valid for man and the human stage only — for in the animal it would be rather the pranamaya purusha that is the netā, leader of mind and body. It is one reason why I have not yet allowed the publication of

Rebirth and Karma because this had to be corrected and the deeper truth put in its place. I had intended to do it later on, but had not time to finish the remaining articles.
Other Writings from the *Arya*
The Question of the Month
The Needed Synthesis

What is the Synthesis needed at the present time?

Undoubtedly, that of man himself. The harmony of his faculties is the condition of his peace, their mutual understanding and helpfulness the means of his perfection. At war, they distract the kingdom of his being; the victory of one at the expense of another maims his self-fulfilment.

The peculiar character of our age is the divorce that has been pronounced between reason and faith, the logical mind and the intuitive heart. At first, the declaration of war between them was attended by painful struggles, a faith disturbed or a scepticism dissatisfied. But now their divorce has created exaggerated tendencies which impoverish human life by their mutual exclusiveness, on the one side a negative and destructive critical spirit, on the other an imaginative sentiment which opposes pure instinct and a faith founded on dreams to the sterile fanaticism of the intellect.

Yet a real divorce is impossible. Science could not move a step without faith and intuition and today it is growing full of dreams. Religion could not stand for a moment if it did not support itself by the intellectual presentation, however inadequate, of profound truths. Today we see it borrowing many of its weapons from the armoury of its opponent. But a right synthesis in virtue of a higher and reconciling truth can alone dissipate their mutual misunderstandings and restore to the race its integral self-development.

The synthesis then of religious aspiration and scientific faculty, as a beginning; and in the resultant progress an integrality also of the inner existence. Love and knowledge, the delight of the Bhakta and the divine science of the knower of Brahman, have to effect their unity; and both have to recover the fullness
of Life which they tend to banish from them in the austerity of their search or the rapture of their ecstasy.

The heart and the mind are one universal Deity and neither a mind without a heart nor a heart without a mind is the human ideal. Nor is any perfection sound and real unless it is also fruitful. The integral divine harmony within, but as its result a changed earth and a nobler and happier humanity.
“Arya” — Its Significance

What is the significance of the name, “Arya”? The question has been put from more than one point of view. To most European readers the name figuring on our cover¹ is likely to be a hieroglyph which attracts or repels according to the temperament. Indians know the word, but it has lost for them the significance which it bore to their forefathers. Western Philology has converted it into a racial term, an unknown ethnological quantity on which different speculations fix different values. Now, even among the philologists, some are beginning to recognise that the word in its original use expressed not a difference of race, but a difference of culture. For in the Veda the Aryan peoples are those who had accepted a particular type of self-culture, of inward and outward practice, of ideality, of aspiration. The Aryan gods were the supraphysical powers who assisted the mortal in his struggle towards the nature of the godhead. All the highest aspirations of the early human race, its noblest religious temper, its most idealistic velleities of thought are summed up in this single vocable.

In later times, the word Arya expressed a particular ethical and social ideal, an ideal of well-governed life, candour, courtesy, nobility, straight dealing, courage, gentleness, purity, humanity, compassion, protection of the weak, liberality, observance of social duty, eagerness for knowledge, respect for the wise and learned, the social accomplishments. It was the combined ideal of the Brahmana and the Kshatriya. Everything that departed from this ideal, everything that tended towards the ignoble, mean, obscure, rude, cruel or false, was termed un-Aryan. There is no word in human speech that has a nobler history.

¹ आय — the word “aryya” printed in Devanagari script on the cover of the review. See page 97. — Ed.
In the early days of comparative Philology, when the scholars sought in the history of words for the prehistoric history of peoples, it was supposed that the word Arya came from the root \textit{ar}, to plough, and that the Vedic Aryans were so called when they separated from their kin in the north-west who despised the pursuits of agriculture and remained shepherds and hunters. This ingenious speculation has little or nothing to support it. But in a sense we may accept the derivation. Whoever cultivates the field that the Supreme Spirit has made for him, his earth of plenty within and without, does not leave it barren or allow it to run to seed, but labours to exact from it its full yield, is by that effort an Aryan.

If Arya were a purely racial term, a more probable derivation would be \textit{ar}, meaning strength or valour, from \textit{ar}, to fight, whence we have the name of the Greek war-god Ares, \textit{areios}, brave or warlike, perhaps even \textit{aretē}, virtue, signifying, like the Latin \textit{virtus}, first, physical strength and courage and then moral force and elevation. This sense of the word also we may accept. “We fight to win sublime Wisdom, therefore men call us warriors.” For Wisdom implies the choice as well as the knowledge of that which is best, noblest, most luminous, most divine. Certainly, it means also the knowledge of all things and charity and reverence for all things, even the most apparently mean, ugly or dark, for the sake of the universal Deity who chooses to dwell equally in all. But, also, the law of right action is a choice, the preference of that which expresses the godhead to that which conceals it. And the choice entails a battle, a struggle. It is not easily made, it is not easily enforced.

Whoever makes that choice, whoever seeks to climb from level to level up the hill of the divine, fearing nothing, deterred by no retardation or defeat, shrinking from no vastness because it is too vast for his intelligence, no height because it is too high for his spirit, no greatness because it is too great for his force and courage, he is the Aryan, the divine fighter and victor, the noble man, \textit{aristos}, best, the \textit{śreṣṭha} of the Gita.

Intrinsically, in its most fundamental sense, Arya means an effort or an uprising and overcoming. The Aryan is he who
strives and overcomes all outside him and within him that stands opposed to the human advance. Self-conquest is the first law of his nature. He overcomes earth and the body and does not consent like ordinary men to their dullness, inertia, dead routine and tamasic limitations. He overcomes life and its energies and refuses to be dominated by their hungers and cravings or enslaved by their rajasic passions. He overcomes the mind and its habits, he does not live in a shell of ignorance, inherited prejudices, customary ideas, pleasant opinions, but knows how to seek and choose, to be large and flexible in intelligence even as he is firm and strong in his will. For in everything he seeks truth, in everything right, in everything height and freedom.

Self-perfection is the aim of his self-conquest. Therefore what he conquers he does not destroy, but ennobles and fulfils. He knows that the body, life and mind are given him in order to attain to something higher than they; therefore they must be transcended and overcome, their limitations denied, the absorption of their gratifications rejected. But he knows also that the Highest is something which is no nullity in the world, but increasingly expresses itself here,—a divine Will, Consciousness, Love, Beatitude which pours itself out, when found, through the terms of the lower life on the finder and on all in his environment that is capable of receiving it. Of that he is the servant, lover and seeker. When it is attained, he pours it forth in work, love, joy and knowledge upon mankind. For always the Aryan is a worker and warrior. He spares himself no labour of mind or body whether to seek the Highest or to serve it. He avoids no difficulty, he accepts no cessation from fatigue. Always he fights for the coming of that kingdom within himself and in the world.

The Aryan perfected is the Arhat. There is a transcendent Consciousness which surpasses the universe and of which all these worlds are only a side-issue and a by-play. To that consciousness he aspires and attains. There is a Consciousness which, being transcendent, is yet the universe and all that the universe contains. Into that consciousness he enlarges his limited ego; he becomes one with all beings and all inanimate objects
in a single self-awareness, love, delight, all-embracing energy. There is a consciousness which, being both transcendental and universal, yet accepts the apparent limitations of individuality for work, for various standpoints of knowledge, for the play of the Lord with His creations; for the ego is there that it may finally convert itself into a free centre of the divine work and the divine play. That consciousness too he has sufficient love, joy and knowledge to accept; he is puissant enough to effect that conversion. To embrace individuality after transcending it is the last and divine sacrifice. The perfect Arhat is he who is able to live simultaneously in all these three apparent states of existence, elevate the lower into the higher, receive the higher into the lower, so that he may represent perfectly in the symbols of the world that with which he is identified in all parts of his being,—the triple and triune Brahman.
Meditation

What exactly is meant by meditation in Yoga? And what should be its objects?

The difficulty our correspondent finds is in an apparent conflict of authorities, as sometimes meditation is recommended in the form of a concentrated succession of thoughts on a single subject, sometimes in the exclusive concentration of the mind on a single image, word or idea, a fixed contemplation rather than meditation. The choice between these two methods and others, for there are others, depends on the object we have in view in Yoga.

The thinking mind is the one instrument we possess at present by which we can arrive at a conscious self-organisation of our internal existence. But in most men thought is a confused drift of ideas, sensations and impressions which arrange themselves as best they can under the stress of a succession of immediate interests and utilities. In accordance with the general method of Nature much is used as waste material and only a small portion selected for definite and abiding formations. And as in physical Nature, so here the whole process is governed by laws which we rather suffer than use or control.

The concentration of thought is used by the Rajayogins to gain freedom and control over the workings of mind, just as the processes of governed respiration and fixed posture are used by the Hathayogins to gain freedom and control over the workings of the body and the vital functions.

By meditation we correct the restless wandering of the mind and train it like an athlete to economise all its energies and fix them on the attainment of some desirable knowledge or self-discipline. This is done normally by men in ordinary life, but Yoga takes this higher working of Nature and carries it to its
full possibilities. It takes note of the fact that by fixing the mind luminously on a single object of thought, we awaken a response in general Consciousness which proceeds to satisfy the mind by pouring into it knowledge about that object or even reveals to us its central or its essential truth. We awaken also a response of Power which gives us in various ways an increasing mastery over the workings of that on which we meditate or enables us to create it and make it active in ourselves. Thus by fixing the mind on the idea of Divine Love, we can come to the knowledge of that principle and its workings, put ourselves into communion with it, create it in ourselves and impose its law on the heart and the senses.

In Yoga concentration is used also for another object,—to retire from the waking state, which is a limited and superficial condition of our consciousness, into the depths of our being measured by various states of Samadhi. For this process contemplation of the single object, idea or name is more powerful than the succession of concentrated thoughts. The latter, however, is capable, by bringing us into indirect but waking communion with the deeper states of being, of preparing an integral Samadhi. Its characteristic utility, however, is the luminous activity of formative thought brought under the control of the Purusha by which the rest of the consciousness is governed, filled with higher and wider ideas, changed rapidly into the mould of those ideas and so perfected. Other and greater utilities lie beyond, but they belong to a later stage of self-development.

In the Yoga of Devotion, both processes are equally used to concentrate the whole being or to saturate the whole nature with thoughts of the object of devotion, its forms, its essence, its attributes and the joys of adoration and union. Thought is then made the servant of Love, a preparer of Beatitude. In the Yoga of Knowledge meditation is similarly used for discrimination of the True from the apparent, the Self from its forms, and concentrated contemplation for communion and entry of the individual consciousness into the Brahman.
An integral Yoga would harmonise all these aims. It would have also at its disposal other processes for the utilisation of thought and the mastery of the mind.
Different Methods of Writing

What is the origin of the different methods of writing, — from right to left, from left to right or, like the Chinese, vertically?

The question is one of great interest but impossible to solve definitely for lack of substantial data. All one can do is to speculate on the most probable and satisfying explanation.

In the first place, it is evident that these differences are no mere accident nor the result of some trivial and local cause; for they coincide with great cultural divisions of humanity belonging to prehistoric times. It is the races called Aryan from their common original culture whose script is directed from left to right; the Mesopotamian races deriving their culture from the Chaldeans proceed from right to left; the Mongolians write vertically.

In the second place no explanation is possible if we adopt the view that writing is a comparatively recent invention in the history of the human race and borrowed by all the ancient nations from a common source, — a derivation, let us say, from Egyptian hieroglyphs popularised and spread broadcast over earth by the commercial activities of Phoenician traders. We must suppose on the contrary that these differences were developed at a very early time while the great cultures were in their formation and before the dispersal of the races representing them.

Undoubtedly, the general use of writing is a late development in the history of the present cycle of civilisation. And to this retardation two causes contributed, at first, the absence of a simple and easy system and, afterwards, the absence of a simple, common, but handy and durable material. While this state of things endured, writing would not be used for daily and ordinary purposes, but only in connection with great religious ceremonies or, where culture was materially more advanced, for
the preservation of important records or of treasured and sacred knowledge.

It is, therefore, in some circumstance intimately connected with religious ideas and practices that we must look for the explanation we are seeking; and it should be a circumstance common to all these cultures, yet capable of leading to so striking a difference.

The one important circumstance common, one might almost say central, to the ideas and practices of the ancient nations was the reverence for the sun and its supreme importance in religious ceremonies. Might not the direction adopted for their writing be determined by some difference in their attitude towards the direction of the sun in its daily movement from east to west?

The difference of attitude can only be explained if we suppose that for some reason the Aryan forefathers had their faces turned southwards, the Mesopotamian northwards and the Mongolian eastwards. In that case, the sun for the Aryans would move from their left to their right, for the Mesopotamians from their right to their left, for the Mongolians straight towards them, and this difference would be represented by the movement of the hand tracing the sacred symbols on some hard flat surface, of stone or other material used for these early scripts.

But what circumstance, again, could lead to this difference? We can only think of one, — that this tendency might have been formed during the constant migration of these races from their original habitat. If we accept Mr. Tilak’s theory of an Aryan migration from the arctic regions southwards towards India, Persia and the Mediterranean countries; if we can suppose that the fathers of the Mesopotamian culture came from the south northwards and that the first Mongolian movement was from Central Asia to the east, we shall have the necessary conditions. We may thus explain also the Sanskrit terms for the four directions; for entering India from the west and following this line in their early colonisation, the east would be in front of the Aryans, pūrva, the west behind, paścima, the south on their right, daksīna, while the name for the north, uttāra, higher, might possibly indicate a memory of their old northern home in
that supreme point of the earth where they still placed the sacred mountain of their gods.

Necessarily, this explanation is in the highest degree conjectural and depends on pure intellectual reasoning which is an unsafe guide in the absence of solid and sufficient data. Nevertheless, it is the one positive explanation that suggests itself to us and, as a hypothesis, is well worth taking into consideration.
Occult Knowledge and the Hindu Scriptures

Are any of the following queries touched in Sanatan Dharma books of philosophy?

1) The nature and formation of animal souls.
2) The shape, size, formations, nature and colour of subtle bodies.
3) The difference between the subtle bodies of saints and ordinary people and the process of developing one into the other.
4) The rationale of the reincarnation theory.
5) The nature, constituents and situation of invisible worlds.

The first three questions are of a curious interest, the last two cover a very wide field. All except the fourth belong more or less to a kind of knowledge pursued with eager interest by a growing number of inquirers, but still looked on askance by the human mind in general,—the occult sciences. The Hindu Scriptures and books of philosophy do not as a rule handle such questions very directly or in any systematic fashion. They are concerned either with the great and central questions which have always occupied the human mind, the origin and nature of the universe, the why, whence and whither of life, the highest good and the means of attaining it, the nature of man and the destiny of the human soul and its relation with the Supreme, or else they deal with the regulation of ethics, society and the conduct of daily life. Occult knowledge has been left to be acquired by occult teaching. Nevertheless it was possessed by the ancient sages and our correspondent will find a great deal of more or less scattered information on these and cognate questions in the Veda, Upanishads and Puranas. But it is doubtful whether he would obtain a satisfactory answer to his queries in the form in which he has put them. He will find for instance a long description of invisible
The question of the month... invisible, that is to say, to our physical senses, — in the Vishnu Purana, but it is picturesque rather than precise. We do not think he will find much about the constituents of the worlds or the size of subtle bodies.

The form of the third question lends itself to misconception. Obviously the method for an ordinary man to develop his subtle body into that of a saint, is to cease to be an ordinary man and to become a saint. There can be no other means. The subtle body is the mental case and reflects the changes of the mentality which is housed in it or the influence exercised on it by the activities and experiences of our physical existence.

Reincarnation is much more prominent and the ideas about it more systematised in Buddhist than in Hindu books. But most of the Hindu philosophies took some kind of reincarnation for granted. It was part of the ancient teaching which had come down to them from the earliest times. They are more concerned with its causes and the method of escape from the obligation of rebirth; the thing itself was for them a fact beyond question. But the nature of reincarnation is not the same for all the old thinkers. The Upanishads, for instance, seem to teach that the physical self is dissolved at death into its principle, ether; it is the mental being that appears to be born and reborn, but in reality birth and death are merely semblances and operations of Nature, — of Aditi full of the gods, \textit{Aditi devatāmaya;} the spirit is really one in all bodies and is neither born nor dies. Nachiketas in the Katha \textit{Upanishad} raises the question whether the man as we know and conceive him really survives death and this seems to be the sense of the answer that he receives.
The Universal Consciousness

I have encountered in my life several examples of people living
or trying to live in the universal consciousness and it seemed
to me that it rendered them less compassionate, less humane,
less tender to the sufferings of others. It seems to me that if it is
necessary not to remain in the individual consciousness when
it is a question of our own sufferings, it is otherwise when it
is a question of sympathising with the sufferings of others. In
my opinion we feel more keenly the troubles of our brothers
in humanity if we remain in the individual consciousness. But
I may be mistaken and ask only to be enlightened by you on
this point.

Is it certain that such people are living in the universal con-
sciousness? or, if they are, is it certain that they are really less
humane and compassionate? May they not be exercising their
humanity in another fashion than the obvious and external signs
of sympathy and tenderness?

If a man is really insensible to the experiences of others in the
world, he is not living in the full universal consciousness. Either
he has shut himself up in an experience of an individual peace
and self-content, or he is absorbed by his contact with some
universal principle in its abstract form without regard to its
universal action, or he is living inwardly apart from the universe
in touch with something transcendent of world-experience. All
these states are useful to the soul in its progress, but they are not
the universal consciousness.

When a man lives in the cosmic self, he necessarily embraces
the life of the world and his attitude towards that world strug-
gling upward from the egoistic state must be one of compassion,
of love or of helpfulness. The Buddhists held that immersion in
the infinite non-ego was in itself an immersion in a sea of infinite
compassion. The liberated Sannyasin is described in the Gita
and in other Hindu books as one whose occupation is beneficence to all creatures. But this vast spirit of beneficence does not necessarily exercise itself by the outward forms of emotional sympathy or active charity. We must not bind down all natures or all states of the divine consciousness in man to the one form of helpfulness which seems to us the most attractive, the most beautiful or the most beneficent. There is a higher sympathy than that of the easily touched emotions, a greater beneficence than that of an obvious utility to particular individuals in their particular sufferings.

The egoistic consciousness passes through many stages in its emotional expansion. At first it is bound within itself, callous therefore to the experiences of others. Afterwards it is sympathetic only with those who are identified in some measure with itself, indifferent to the indifferent, malignant to the hostile. When it overcomes this respect for persons, it is ready for the reception of the altruistic principle.

But even charity and altruism are often essentially egoistic in their immediate motive. They are stirred by the discomfort of the sight of suffering to the nervous system or by the pleasurableness of others’ appreciation of our kindliness or by the egoistic self-appreciation of our own benevolence or by the need of indulgence in sympathy. There are philanthropists who would be troubled if the poor were not always with us, for they would then have no field for their charity.

We begin to enter into the universal consciousness when, apart from all individual motive and necessity, by the mere fact of unity of our being with all others, their joy becomes our joy, their suffering our suffering. But we must not mistake this for the highest condition. After a time we are no longer overcome by any suffering, our own or others’, but are merely touched and respond in helpfulness. And there is yet another state in which the subjection to suffering is impossible to us because we live in the Beatitude, but this does not deter us from love and beneficence,—any more than it is necessary for a mother to weep or be overcome by the little childish griefs and troubles of her children in order to love, understand and soothe.
Nor is detailed sympathy and alleviation of particular sufferings the only help that can be given to men. To cut down branches of a man's tree of suffering is good, but they grow again; to aid him to remove its roots is a still more divine helpfulness. The gift of joy, peace or perfection is a greater giving than the effusion of an individual benevolence and sympathy and it is the most royal outcome of unity with others in the universal consciousness.
The News of the Month

“L’IDÉE NOUVELLE”

In close connection with the intellectual work of synthesis undertaken by this Review a Society has been founded in French India under the name of the New Idea, (L’Idée Nouvelle). Its object is to group in a common intellectual life and fraternity of sentiment those who accept the spiritual tendency and idea it represents and who aspire to realise it in their own individual and social action.

The Society has already made a beginning by grouping together young men of different castes and religions in a common ideal. All sectarian and political questions are necessarily foreign to its idea and its activities. It is on a higher plane of thought superior to external differences of race, caste, creed and opinion and in the solidarity of the spirit that unity can be realised.

The Idée Nouvelle has two rules only for its members, first, to devote some time every day to meditation and self-culture, the second, to use or create daily at least one opportunity of being helpful to others. This is, naturally, only the minimum of initial self-training necessary for those who have yet to cast the whole trend of their thought and feeling into the mould of a higher life and to enlarge the egoistic into a collective consciousness.

The Society has its headquarters at Pondicherry with a reading-room and library. A section has been founded at Karikal and others are likely to be opened at Yanaon and Mahe.
An Indo-French Committee in Paris

An Indo-French Committee (Comité Franco-Hindou) has been founded in Paris and M. Pierre Loti has been invited to become its Honorary President. The Committee proposes to develop intellectual, scientific, artistic and economic relations between France and India. It is a good deal for one Committee! Let us at least hope that it will be able to carry out the first item of its programme. No doubt, everything that brings men and nations nearer to each other helps in the formation of a general intelligence more synthetic and comprehensive than the old divided mind of humanity; but it is above all in the realm of thought and by the exchange of ideas and the deeper experiences that the best fruits are likely to be borne. Every new tie, especially every tie of the spirit between Europe and India, between the West of today and the East of yesterday and tomorrow, is a welcome sign of the times for those who know how much the world’s progress depends on their union.

M. Pierre Loti, in a letter addressed to the President of the Committee, thus expresses his veneration for India:

“And now I salute thee with awe, with veneration and wonder, ancient India of whom I am the adept, the India of the highest splendours of Art and Philosophy, the India also of monstrous mysteries that terrify, India our cradle, India where all that has been produced since her beginnings was ever impetuous and colossal. May thy awakening astonish that Occident, decadent, mean, daily dwindling, slayer of nations, slayer of gods, slayer of souls, which yet bows down still, ancient India, before the prodigies of thy primordial conceptions.”

We cannot but subscribe to the sentiment, if not to all the phrases, of this fine piece of literature.

But what are these monstrous and terrifying mysteries of which M. Loti speaks? Terror is no longer in the mode, the age of mysteries is over and the age of monstrosities has never been. Ignorance is the only monstrosity.
MR. TILAK’S BOOK ON THE GITA

In an interview with the representative of an Indian journal Mr. Bal Gangadhar Tilak has given a brief account of the work on the Gita which he has been writing during his six years’ internment in Mandalay. He begins:—

“You know that the Gita is regarded generally as a book inculcating quietistic Vedanta or Bhakti. For myself, I have always regarded it as a work expounding the principles of human conduct from a Vedantic ethical point of view, that is, reconciling the philosophy of active life with the philosophy of knowledge and the philosophy of devotion to God.”

Mr. Tilak then expresses his belief that before Shankara and Ramanuja, the great Southern philosophers, wrote their commentaries, the Gita was understood in its natural sense, but from that time forward artificial and sectarian interpretations prevailed and the element of Karmayoga in the Song Celestial was disregarded. His book is intended to restore this natural sense and central idea of the famous Scripture. It will contain a word for word rendering preceded by an introduction of some fifteen chapters in which he discusses the Vedanta and the ethics of the Gita and compares the ethical philosophy of Western thinkers with that of the Indian schools of thought. Although the book will be published first in Marathi, we are promised a version also in English.

We look forward with interest to a work which, proceeding from a scholar of such eminence and so acute an intellect, one especially whose name carries weight with all Hindus, must be considered an event of no small importance in Indian religious thought. We welcome it all the more because it seems to be conceived in the same free and synthetic spirit as animates this Review. It is a fresh sign of the tendency towards an increasingly liberal movement of religious opinion in orthodox India, the dissolution of the old habit of unquestioning deference to great authorities and the consequent rediscovery of the true catholic sense of the ancient Scriptures.

Those who have studied the Gita with a free mind, still more
those who have tried to live it, cannot doubt for a moment the justice of Mr. Tilak's point of view. But is not the tendency of the Gita towards a supra-ethical rather than an ethical activity? Ethics is, usually, the standardising of the highest current social ideals of conduct; the Song Celestial, while recognising their importance, seeks to fix the principle of action deeper in the centre of a man's soul and points us ultimately to the government of our outward life by the divine self within.

August 1914

THE WAR

The “Arya”, a Review of pure Philosophy, has no direct concern with political passions and interests and their results. But neither can it ignore the enormous convulsion which is at present in progress, nor at such a time can it affect to deal only with the pettier happenings of the intellectual world as if men were not dying in thousands daily, the existence of great empires threatened and the fate of the world hanging in the balance. The War has its aspects, of supreme importance to a synthetic Philosophy, with which we would have the right to deal. But now is not the hour, now in this moment of supreme tension and wide-spread agony. Therefore, for the time, we suppress this heading in our Review and shall replace it by brief notes on subjects of philosophical interest, whether general or of the day. Meanwhile, with the rest of the world, we await in silence the predestined result.

September 1914
South Indian Vaishnava Poetry
Andal
The Vaishnava Poetess

PREOCCUPIED from the earliest times with divine knowledge and religious aspiration the Indian mind has turned all forms of human life and emotion and all the phenomena of the universe into symbols and means by which the embodied soul may strive after and grasp the Supreme. Indian devotion has especially seized upon the most intimate human relations and made them stepping-stones to the supra-human. God the Guru, God the Master, God the Friend, God the Mother, God the Child, God the Self, each of these experiences—for to us they are more than merely ideas,—it has carried to its extreme possibilities. But none of them has it pursued, embraced, sung with a more exultant passion of intimate realisation than the yearning for God the Lover, God the Beloved. It would seem as if this passionate human symbol were the natural culminating-point for the mounting flame of the soul's devotion: for it is found wherever that devotion has entered into the most secret shrine of the inner temple. We meet it in Islamic poetry; certain experiences of the Christian mystics repeat the forms and images with which we are familiar in the East, but usually with a certain timorousness foreign to the Eastern temperament. For the devotee who has once had this intense experience it is that which admits to the most profound and hidden mystery of the universe; for him the heart has the key of the last secret.

The work of a great Bengali poet has recently reintroduced this idea to the European mind, which has so much lost the memory of its old religious traditions as to welcome and wonder at it as a novel form of mystic self-expression. On the contrary it is ancient enough, like all things natural and eternal in the human soul. In Bengal a whole period of national poetry has
been dominated by this single strain and it has inspired a religion and a philosophy. And in the Vaishnavism of the far South, in the songs of the Tamil Alwars we find it again in another form, giving a powerful and original turn to the images of our old classic poetry; for there it has been sung out by the rapt heart of a woman to the Heart of the Universe.

The Tamil word, Alwar, means one who has drowned, lost himself in the sea of the divine being. Among these canonised saints of Southern Vaishnavism ranks Vishnuchitta, Yogin and poet, of Villipattan in the land of the Pandyas. He is termed Periyalwar, the great Alwar. A tradition, which we need not believe, places him in the ninety-eighth year of the Kaliyuga. But these divine singers are ancient enough, since they precede the great saint and philosopher Ramanuja whose personality and teaching were the last flower of the long-growing Vaishnava tradition. Since his time Southern Vaishnavism has been a fixed creed and a system rather than a creator of new spiritual greatnesses.

The poetess Andal was the foster-daughter of Vishnuchitta, found by him, it is said, a new-born child under the sacred tulsi-plant. We know little of Andal except what we can gather from a few legends, some of them richly beautiful and symbolic. Most of Vishnuchitta’s poems have the infancy and boyhood of Krishna for their subject. Andal, brought up in that atmosphere, cast into the mould of her life what her foster-father had sung in inspired hymns. Her own poetry — we may suppose that she passed early into the Light towards which she yearned, for it is small in bulk, — is entirely occupied with her passion for the divine Being. It is said that she went through a symbolic marriage with Sri Ranganatha, Vishnu in his temple at Srirangam, and disappeared into the image of her Lord. This tradition probably conceals some actual fact, for Andal’s marriage with the Lord is still celebrated annually with considerable pomp and ceremony.
Nammalwar

The Supreme Vaishnava Saint and Poet

MAran, renowned as Nammalwar ("Our Saint") among the Vaishnavas and the greatest of their saints and poets, was born in a small town called Kuruhur, in the southernmost region of the Tamil country—Tiru-nelveli (Tinnevelly). His father, Kari, was a petty prince who paid tribute to the Pandyan King of Madura. We have no means of ascertaining the date of the Alwar’s birth, as the traditional account is untrustworthy and full of inconsistencies. We are told that the infant was mute for several years after his birth. Nammalwar renounced the world early in life and spent his time singing and meditating on God under the shade of a tamarind tree by the side of the village temple.

It was under this tree that he was first seen by his disciple, the Alwar Madhura-kavi,—for the latter also is numbered among the great Twelve, "lost in the sea of Divine Love". Tradition says that while Madhura-kavi was wandering in North India as a pilgrim, one night a strange light appeared to him in the sky and travelled towards the South. Doubtful at first what significance this phenomenon might have for him, its repetition during three consecutive nights convinced him that it was a divine summons and where this luminous sign led he must follow. Night after night he journeyed southwards till the guiding light came to Kuruhur and there disappeared. Learning of Nammalwar’s spiritual greatness he thought that it was to him that the light had been leading him. But when he came to him, he found him absorbed in deep meditation with his eyes fast closed and although he waited for hours the Samadhi did not break until he took up a large stone and struck it against the ground violently. At the noise Nammalwar opened his eyes, but still remained
silent. Madhura-kavi then put to him the following enigmatical question, “If the little one (the soul) is born into the dead thing (Matter)\(^1\) what will the little one eat and where will the little one lie?” to which Nammalwar replied in an equally enigmatic style, “That will it eat and there will it lie.”

Subsequently Nammalwar permitted his disciple to live with him and it was Madhura-kavi who wrote down his songs as they were composed. Nammalwar died in his thirty-fifth year, but he has achieved so great a reputation that the Vaishnavas account him an incarnation of Vishnu himself, while others are only the mace, discus, conch etc. of the Deity.

From the philosophical and spiritual point of view, his poetry ranks among the highest in Tamil literature. But in point of literary excellence, there is a great inequality; for while some songs touch the level of the loftiest world-poets, others, even though rich in rhythm and expression, fall much below the poet’s capacity. In his great work known as the Tiru-vay-moli (the Sacred Utterance) which contains more than a thousand stanzas, he has touched all the phases of the life divine and given expression to all forms of spiritual experience. The pure and passionless Reason, the direct perception in the high solar realm of Truth itself, the ecstatic and sometimes poignant love that leaps into being at the vision of the “Beauty of God’s face”, the final Triumph where unity is achieved and “I and my Father are one” — all these are uttered in his simple and flowing lines with a strength that is full of tenderness and truth.

The lines which we translate below are a fair specimen of the great Alwar’s poetry;\(^2\) but it has suffered considerably in the translation, — indeed the genius of the Tamil tongue hardly permits of an effective rendering, so utterly divergent is it from that of the English language.

\(^1\) The form of the question reminds one of Epictetus’ definition of man, “Thou art a little soul carrying about a corpse.” Some of our readers may be familiar with Swinburne’s adaptation of the saying, “A little soul for a little bears up the corpse which is man.”

\(^2\) Sri Aurobindo’s translation of “Nammalwar’s Hymn of the Golden Age” appears in Translations, volume 5 of THE COMPLETE WORKS OF SRI AUROBINDO. — Ed.

The Life Divine
Chapter XIX

Life

ARGUMENT

Mind as a final action of Supermind is a creative and not only a perceptive power; in fact, material force itself being only a Will in things working darkly as the expression of subconscious Mind, Mind is the immediate creator of the material universe. But the real creator is Supermind; for wherever there is Mind conscious or subconscious, there must be Supermind regulating from behind the veil its activities and educing from them their truth of inevitable result. Not a mental Intelligence, but Supermind is the creator of the universe. — Mind manifests itself in the form of Force to which we give the name of Life, and Life in Matter is an energy or power in dynamic movement which builds up forms, energises, maintains, disintegrates and recreates; death itself is only a process of life. It is one all-pervading Life or constant movement of dynamic energy which creates all these forms of the material universe and is not destroyed in the destruction of its forms. — The distinction between animal and plant life is unreal and that between the animate and the inanimate unessential. Plant-life has been found to be identical in organisation with animal-life and, although the organisation may differ, life is also present in the metal, the earth, the atom. This life-force pervades the universe and is present in every form of it and there is a constant interchange of its energies which creates the symptoms and characteristics of vitality recognised by us; but even where these are suspended, Life is present and only withdraws by a process of dispersion which replaces the process of continual reconstitution of the form. The presence of these symptoms and characteristics is not the essential nor is their absence a sign of the

Sri Aurobindo prefixed brief summaries or "arguments" to fifteen chapters of The Life Divine when they were first published in the Arya in 1916 and 1917. He omitted these summaries when he revised the book in 1939–40.
absence of Life-force. Even where we do not detect Life, it exists. — Conscious nervous sensation accompanies life in the animal, but much of the action of nervous or life energy is subconscious; in the plant, as in many actions of man, the nervous sensation is present but the mentality of the sensation is subconscious. In the very atom there is a subconscious will and desire which must also be present in all atomic aggregates because they are present in the Force which constitutes the atom. That force is Chit-shakti, force of conscious being, variously represented in various forms of life. — Life is an energising of conscious being in substance of Matter, which on one side is constantly supplying the material of physical formation and on the other labouring to release mind and sense from their subconscious sleep in Matter. It is therefore the dynamic link between Mind and Matter. To create form and evolve consciousness out of its imprisonment in form is the sense of the omnipresent Life in the universe.
Chapter XX

Death, Desire and Incapacity

ARGUMENT

Life is the same whatever its workings and its terms need not be limited to those proper to physical existence. Life is a final operation of divine conscious-force for individualising existence; it is the energy-aspect of Mind when that creates and relates itself to form of substance: it has all the universal conscious-force of existence behind it and is not a separate entity or movement. Life in us must become conscious of this divine Force behind it in order to become divine. — Life, at first darkened, ignorant, divided and helplessly subject, seeks as it develops to become master and enjoyer, to grow in Power; but until it escapes from the bonds of individuality it must be subject to its three badges of limitation, Death, Desire and Incapacity. — The nature of physical life imposes death because all life exists by a mutual devouring and struggle and Life itself feeds upon the forms it creates; but the fundamental justification of Death is the necessity of a constant variation of experience in succession of Time, the soul seeking thus to enlarge itself and move towards the realisation of its own infinity. — The process of Death results inevitably from the division of substance; life’s attempt to aggrandise its being thus divided and limited translates itself into the hunger that devours. This hunger is the crude form of Desire, and Desire is the necessary lever for self-affirmation; but eventually Desire has to grow out of the law of Hunger into the law of Love. — Desire itself is the result of the limitation of capacity which is the consequence of divided Life working as the energy of ignorant mind, all-force being only possible to all-knowledge. Therefore growth by struggle is the third Law of Life. This strife again has to divinise itself and become the clasp of Love. Until then Death, Desire and Strife are and must be the triple mask of the divine Life-principle in its cosmic self-affirmation.
Chapter XXI

The Ascent of Life

ARGUMENT

The development of Life starts from an original status of division, subconscious will and inert subjection to mechanical forces. This is the type of material existence. — The terms of the second status which we recognise as vitality, are death, hunger and conscious desire, sense of limited capacity and the struggle for survival and mastery. This is the basis of the Darwinian conception of Life, the struggle for life and the survival of the fittest. But this struggle involves a third status whose preparation is marked by the emergence of the conscious principle of love. — The third status contradicts the others in appearance, but really fulfils them. Life begins with division and aggregation based on the refusal of the atom, the first principle of ego and individuality to accept death and fusion by dissolution. This gives a firm basis for the creation of aggregate forms to be occupied by vital and mental individualities. In the next stage we have the general principle of death and dissolution by which the individual form fuses itself in its elements into other lives. This principle of constant fusion and interchange is the law of Life and extends into vital and mental existence as well as the physical. The two principles of individual persistence and mutual fusion have to be harmonised and this can only be done by the emergence and full development of mind which alone is subtle enough to persist in individual consciousness beyond all fusion and dissolution of forms. Here the union and harmony of the persistent individual and the persistent aggregate life become possible. — Love is the power by which this union and harmony are worked out; for love exists by the persistence of the individual and his conscious acceptance of the necessity and desire of interchange and self-giving. Its growth means the emergence of Mind imposing its law on the material existence, for Mind does not need to devour
in order to possess and grow; it increases by giving and confirms itself by fusion with others. — Subconscious will in the atom becomes hunger and conscious desire in the vital being. Love is the transfiguration of desire, a desire of possessing others but also of self-giving; at first subject to hunger and the desire of possession it reveals its own true law by an equal or greater joy in self-giving. — The inert subjection of the will in the atom to the not-self becomes in the vital being the sense of limited capacity and the struggle for possession and mastery. In the third status the not-self is recognised as a greater self and subjection to its law and need freely accepted; at the same time the individual by making the aggregate life and all it has to give his own, fulfils his impulse of possession. This is the Mind's reconciliation of the two conflicting principles which we find at the root of all existence. — But the true and perfect reconciliation can only come by passing beyond Mind and founding all the operations of life on the essential freedom and unity of the spirit.
Chapter XXII

The Problem of Life

ARGUMENT

Life being a divided movement of consciousness although really an undivided force becomes a clash of opposing truths each striving to fulfil itself. Mind has to solve the thousand and one problems resulting but in Life itself, not merely in thought. The difficulty lies in its ignorance of itself and the world. Man knows only the surface of his own being and does not know the universality of the Force of which he is a part; therefore he can master neither himself nor the world. He has to know and solve the problem or else give place to some higher evolutionary being. — The poise of Life is determined by the relation of the Force to the Consciousness which drives it. Accordingly we have, besides the Infinite Existence, first the life of material Nature ruled by the infallible Inconscient; secondly the life of conscious being in material Nature emerging out of the Inconscient, fallible, bewildered, only half-potent, which is our own; and thirdly the life of the real Man to which we are moving where Consciousness and Force are fulfilled and in harmony and the One at unison with the many. That life will be founded on the awareness of one Consciousness in many minds, one Force working in many lives, one Delight of being in many hearts and bodies. — Man's difficulties; first, he only knows and governs a part of himself, the greater part of himself is subconscient and it is this greater cosmic part that really governs his surface being. This is what is meant by his being governed by his Nature and by the Lord seated within through the Maya or apparent denial of Sachchidananda by Himself. It is only by becoming one with the Lord that man can be master of himself, but this union must be in the Divine Maya, in the superconscient and not only or chiefly in this lower Maya of the mental existence. — Secondly, he is separated by his individuality from the universal and does not
know his fellow-beings. He must be not only in sympathy with them, but arrive at a conscious unity with all and this conscious unity exists only in what is now superconscient to us. — Thirdly, Life is at war with body, Mind at war with the life and the body, each trying to subject the others to its own law. Only the supramental can find the law of immortal harmony which shall reconcile this discord of our mortality. Each of these principles has besides a soul in it which seeks a self-fulfilment beyond what the present force of life, mind or body can give. There is a conflict between opposing instincts of the body, opposing desires and impulses of the life, opposing ideas of the mind. The principle of unity is above in the supermind. — Man as he develops becomes acutely aware of all these discords and seeks a reconciliation with himself and with his fellow-beings. This can only come by the perfection of his own existence through the principle in himself to which he has not yet attained and by embracing consciously the life of others in his own through a universal consciousness which must also be gained by the superconscient becoming conscient in us through an upward evolution.
Chapter XXIII

The Double Soul in Man

ARGUMENT

The ascent of Life is in its nature the ascent of the divine Delight in things from its dumb conception in Matter to its luminous consummation in Spirit. Like the other original divine principles, this Delight also must be represented in us by a cosmic principle corresponding to it in the apparent existence. It is the soul or psychic being. — As there is a subliminal luminous mind behind our surface mind, a subliminal life behind our mortal life, a subliminal wider corporeality behind our gross body, so we have a double soul, the superficial desire-soul and the true psychic entity. — The superficial in us is the small and egoistic, the subliminal is in touch with the universal. So our subliminal or true psychic being is open to the universal delight of things, the superficial desire-soul is shut off from it. It feels the outward touches of things, not their essence and therefore not their rasa or true touch; and because it cannot reach the universal world-soul, it cannot find its own true soul which is one with the world-soul. — The desire-soul returns the triple response of pleasure, pain and indifference, but the psychic being behind it has the equal delight of all of its experiences; it compels the desire-soul to more and more experience and to a change of its values. By bringing this soul to the surface we can overcome the duality of pleasure and pain, as is actually done in certain directions of experience by the artist, Nature-lover, God-lover, etc. each in his own fashion. But the difficulty is to do it in the desire-soul at its centre where it comes into contact with practical living; for here the human mind shrinks from the application of the principle of equality. — To bring this subliminal soul to the surface is not enough; for it is open passively to the world-soul but cannot possess the world. Those who thus arrive, become close to the universal delight, but not masters of life. For there
are two principles of order and mastery, one false, the ego-sense, the other true, the Lord who is one in the many. By merely suppressing the ego-sense in the impersonal delight we gain the centreless Impersonal and are fulfilled in our static being but not in our active being. We must therefore gain the other centre in the Supermind by which we shall consciously possess and not merely undergo the delight of the One in His universal existence.
Chapter XXIV

Matter

ARGUMENT

Life and Mind are in the fact of evolution conditioned by the body and therefore by the principle of Matter. The body is the chief difficulty in the way of a spiritual transformation of life; it has therefore been regarded by spiritual aspiration as an enemy and the escape from the material existence has been made an indispensable condition of the final emancipation. The quarrel begins with the struggle between Life and Matter with the apparent defeat of life in death as its constant circumstance; it continues with the struggle of the Mind against the life and the body and culminates with the struggle of the spirit against all its instruments; but the right end and solution of these discords is not an escape and a severance but the complete victory of the higher over the lower. We have to examine the problem of the reality of Matter. Our present experience of Matter does not give us its truth; for Matter is only an appearance of the Reality, a form of its force-action presented to the principle of sense in the universal consciousness. As Mind is only a final dividing action of Supermind and Life of Conscious-Force working in the conditions of the Ignorance, so Matter as we know it is only the final form taken by conscious-being as the result of that same working. Mind precipitating itself into Life to create form gives to the universal principle of Being the appearance of material substance instead of pure substance, that is to say, of substance offering itself to the contact of mind as a stable thing or object. This contact of mind with its object is Sense. In the divine Mind there is a movement which presents to the divine Knower the forms of Himself as objects to His knowledge and this would create a division between the Knower and the object of knowledge if there were not at the same time, inevitably, another movement by which He feels the object as
Himself. This movement, in the divided state of existence created by dividing Mind, is represented to us as the contact of sense which becomes a basis for contact through the thought-mind by which we return towards unity. — Since the action of Mind is to divide infinitely the one infinite existence, Matter, the result of that action, becomes in its apparent nature an infinite atomic division and atomic aggregation of infinite substance. But its reality is one and indivisible, even as is the reality of Life and of Mind. Matter is Sachchidananda represented to His own mental experience as a formal basis of objective knowledge, action and delight.
Chapter XXV

The Knot of Matter

ARGUMENT

Spirit and Matter are the two ends of a unity, Spirit the soul and reality of Matter, Matter the form and body of Spirit. There is an ascending series of substance and Spirit at the summit is itself pure substance of being. Brahman is the sole material as well as the sole cause of the universe and Matter also is Brahman; it is, like Life, Mind and Supermind, a mode of the eternal Sachchidananda. — Still, practically, Matter seems to be cut off from Spirit and even its opposite and the material existence incompatible therefore with the spiritual. Matter is the culmination of the principle of Ignorance in which Consciousness has lost and forgotten itself and the self-luminous Spirit is represented by a brute inconscient Force in whose mere action there appears to be no self-knowledge, mind or heart. In this huge no-mind Mind emerges and has to labour besieged and limited by the universal Ignorance and in this heartless Inconscience a heart has manifested which has to aspire opposed and corrupted by the brutality of material Force. This is the form-absorbed Consciousness returning progressively to itself, but obliged to work under the conditions of Matter, that is to say, always bound and limited in its results. — For Matter is the opposite of the Spirit’s freedom and mastery, the culmination of bondage; it is a huge force of movement, but of inertly driven movement subject to a law of which it has no conscience nor initiative but mechanically obeys. It opposes therefore to the attempt of Life to impose itself and freely utilise and the attempt of Mind to impose itself and know and freely guide the constant opposition of its inertia; it yields reluctantly to a certain extent, but brings always in the end a definite denial, limit and obstruction. For this reason knowledge, power, love, etc. are always pursued, accompanied and hedged in by their opposites. — For Matter is the culmination
of the principle of division and struggle. It can only unify by an association which carries with it the possibility of dissociation and an assimilation which devours. Therefore Life and Mind in Matter working under this law of division and struggle, that is to say, of death, desire and limitation, aggregation and subsequent dissociation, labour without any finality or certainty of assured progress. — But especially the divisions of Matter bring in the law of pain. Ignorance and Inertia would not be necessarily a cause of pain if the Mind and Life were not aware of an infinite Consciousness, Light and Power in which they live but are prevented from participating by the Ignorance and Inertia of Matter or were not stirred to possess this wideness partly or wholly. Man especially, because he is most self-conscious, develops this awareness to a high degree, nor can he be permanently satisfied with increase of power or knowledge within the limits of the material world, for that is also limited and inconclusive and, being aware of and impelled by the infinite within and around him, he cannot escape the necessity of seeking to know and possess it. This progression of the conscious being out of the Inconscient to the infinite Consciousness might be a happy outflowering but for the principle of rigid division and imprisonment of each divided being in his own ego which imposes the law of struggle, the dualities of attraction and repulsion, pleasure and pain, effort and failure, action and reaction, satisfaction and dissatisfaction. All this is the denial of Ananda and implies, if the negation be insuperable, the futility of existence; for if in this existence the satisfaction sought by the Infinite in the finite cannot be found, then ultimately it must be abandoned as an error and a failure. — This is the basis of the pessimist theory of material existence which supposes Matter to be the form and Mind the cause of the universe and both of these to be eternally subject to limitation and ignorance. But if on the contrary it is immortal and infinite Spirit which has veiled itself in Matter and is emerging, the development of a liberated supramental being who shall impose in Mind, Life and Matter a higher law than that of limitation and division, is the inevitable conclusion from the nature of cosmic existence. There is no reason why such a
being should not liberate and make divine the physical existence as well as the mind and life, unless our present view of Matter represents the sole possible relation here between sense and its object in which case, indeed, fulfilment must be sought only in worlds beyond. But there are other states even of Matter and an ascending series of the gradations of substance, and their higher law is possible to the material being because it is there in it already latent and potential.
Chapter XXVI

The Ascending Series of Substance

ARGUMENT

The materiality of Matter consists in a concentration of the density of substance and its resistance to the conscious-force of which through sense it becomes the object. An ascending scale of substance from Matter to Spirit must mean a diminution of resistance, division and bondage and an increasing subtlety, flexibility, power of assimilation, interchange, transmutation, unification. — There is such an ascending scale from the dense to the subtle even in material substance and beyond the subtlest material essence we have grades of other substance corresponding to the series of Matter, Life, Mind, Supermind and Spirit. Each, that is to say, is the basis of a world or other kind of existence in which these higher principles successively dominate the others and fulfil themselves with their aid. In each therefore there is an ever wider range of being, consciousness and force ascending from the inconscience of material substance to the infinite self-consciousness of spiritual. But all these principles are interconnected. Matter contains all of them and evolves them out of itself in obedience to the constant pressure of the higher worlds, an evolution which must continue until they are able to express themselves fully in the material principle. — Man is the fit instrument for this fulfilment. He has other bodies besides the physical in which he can become conscious and so enter into the supraphysical grades of substance and impose their law upon his material existence. Therefore his complete perfection is through the ascent to supermind and the conquest of the physical also by the supramental substance so that he will be able to command a diviner physical life and conquer death in a divine body.
Chapter XXVII

The Sevenfold Chord of Being

ARGUMENT

There are, therefore, seven or else eight principles of being and the four which constitute human existence are a refraction of the four which constitute divine existence, but in inverted order. The Divine descends from pure existence to Supermind to cast itself into cosmic existence; the creature ascends from Matter to Mind towards the Divine and meets it where mind and Supermind meet with a veil between them. By the rending of the veil each of the four divine human principles can find its transfigured self in its divine equivalent. This transfiguration is the only possible positive goal of the creative evolution. — The presence of the seven principles is essential to all cosmic being. For cosmic being cannot exist except as the All-existence figuring itself in its self-conception as Time and Space, nor can this figuration take place except by an infinite Force which being of the nature of an all-determining and all-apprehending Will must repose on the action of an all-comprehending infinite Consciousness. Nor could the result be a cosmos but for a power of infinite knowledge and will determining out of the infinity in each figure of things their law, form and course through a self-limitation by Idea proceeding from a boundless liberty within. That power of Knowledge-Will, that Idea is the fourth name of the Divine; it is the Supermind or supreme Gnosis. — The lower trilogy is also necessary in some form however different it may be from our experience of Life, Mind and Matter. For there must be a subordinate power and action of Supermind measuring, creating fixed standpoints of mutual view and interaction in the universal self-diffusion as between an infinite number of centres of the one Consciousness; and such a power would be what we mean by Mind. So too, Mind once given, Life, which is the working of will and energy and conscious dynamis of being dependent on
such fixed standpoints of interaction, must accompany it and substance with differentiation of form must also be present. — It follows that in every cosmic arrangement the seven principles must be existent, either manifested in simultaneous apparent action or else all apparently involved in one of them which then becomes the initial principle, but all secretly at work and bound to evolve into manifestation. Therefore out of initial Matter latent Life and Mind have emerged as apparent Life and Mind, and latent Supermind and the hidden Spirit must emerge as apparent Supermind and the triune glory of Sachchidananda.
Chapter XXVIII

The Knowledge and the Ignorance

ARGUMENT

The seven principles of existence are, then, one in their reality, inseparable in their sevenfold action. They create the harmony of the universe and there is no essential reason why this should not be a complete harmony free from the element of discord, division and limitation. — The Vedic seers believed in such a creation and held its formation in man — called immortality — to be the object of man’s Godward effort. But this is difficult for the human mind to accept, except in a beyond, because here the Inconscient seems to be all and the conscient soul an accident or an alien unable fully to realise itself. Here Ignorance seems to be the law. — It is true that here we start from the Inconscient and are governed by the Ignorance; we must therefore examine this power of Consciousness and determine its operation and origin, — not accepting the refusal of some philosophies to consider the question because it is insoluble; and first we must fix what we mean by the Ignorance. — In the Veda the Ignorance is the non-perceiving of the essential unity which is beyond mind and of the essence and self-law of things in their original unity and actual universality; it is a false knowledge based on division of the undivided, insistence on the fragmentary and little and rejection of the vast and complete view of things; it is the undivine Maya. — The Vedantic distinction of Vidya and Avidya made the opposition more trenchant, Vidya being the knowledge of unity, Avidya the knowledge of multiplicity, but the knowledge of both was held to be necessary for the Truth and the Immortality; the Ignorance was not a mere falsehood and seeing of unreality. The One really becomes

Chapter XXVIII of The Life Divine as published in the Arya was extensively revised in 1939–40, becoming the present Book Two, Part I, Chapter VII.
the Many. — Later, the opposition was supposed to be rigid and irreconcilable, the world unreal, a super-imposition of name and form on featureless Unity by Mind, the Ignorance an absolute nescience of the Truth. — This we reject, because such dialectical oppositions, flawed at their source, represent no actual reality of existence as a whole; there is no irreconcilable opposition of dual principles, Ignorance creative, Knowledge destructive of world-existence, but an essential unity. As pain is an effect of the universal Delight produced in the recipient by incapacity, as incapacity is a disposition of the universal Will-force, so ignorance is a particular action of the universal Knowledge. — Consciousness, which is Power, takes three poises; its plenitude of the divine knowledge invariable in unity and multiplicity and beyond; its dwelling upon apparent oppositions, the extreme being the superficial appearance of complete nescience in the Inconscient; and a mediary term or compromise between the two which is a superficial and partial emergence of self-conscious knowledge, our own egoistic ignorance or false-knowledge. The exact relations between these three have to be determined.
Chapter XXIX

Memory, Self-Consciousness and the Ignorance

ARGUMENT

Memory is believed by some schools to be the constituent of our continuous personality; but memory is only a mechanism, a device, a substitute for direct consciousness. The mind is directly conscious of existence in the present, holds existence in the past by its substitute memory, infers its future existence from this direct present self-consciousness and the memory of its continuity in the past. — This sense of self-conscious existence it extends into the idea of eternity, but the only eternity the mind really seizes is a continuous succession of moments of being in eternal Time; of this eternity it possesses only the present moment, a limited portion of the past held fragmentarily and nothing at all of the future, while it is unable to know any timeless eternity of conscious being, any real eternal Self. Therefore the nature of our Mind is an Ignorance seizing at knowledge by successive action in the moments of Time. — If mind is all, then we must remain for ever in this Ignorance which is not absolute nescience, but an ineffectual and fragmentary seizing at knowledge. But there are really two powers of our conscious being, Ignorance of the mind, Knowledge beyond mind, simultaneously existing, either separately in an eternal dualism or, as is really the fact, as superior and inferior, sovereign and dependent states of the same consciousness, by which the Knower sees his timeless being and the action of Time in that self through the Knowledge while he sees himself in Time and travelling in the succession of its moments by the Ignorance. For this reason the Upanishad declares that Brahman can really be known only by knowing

Chapter XXIX of The Life Divine as published in the Arya was revised in 1939–40, becoming the present Book Two, Part I, Chapter VIII.

www.holybooks.com
him as both the Knowledge and the Ignorance and so only can one arrive at the status of immortality. — Ignorance is therefore the consciousness of being in the succession of Time, and it is so called because, actually self-divided by the moments of Time, the field of space and the forms of the multiplicity, it cannot know either eternal Being or the World, either the transcendent or the universal reality. Its knowledge is partly true, partly false, because it ignores the essence and sees only fugitive parts of the phenomenon. — It is through self-consciousness that the mind can arrive most readily at the eternal Reality; the rest of its means of knowledge are, like memory, devices and substitutes for direct consciousness. It is easy therefore to regard the knowledge of the self within as real and the rest as not-self and illusion. But the distinction is illusory and self-absorption in the stable self within is only one state of consciousness like self-dispersion in thought and memory and will. The real self is the Eternal who is capable simultaneously of the mobility in Time and the immobility basing Time. All object of knowledge is that real and eternal self whether seen in essence and stability or in phenomenon and instability of Time. — The Ignorance is a means by which it is rendered into values of knowledge and action, Time being a sort of bank on which we draw for valuation and action in the present, with a realised store in the account of the past and an unrealised infinite deposit to be taken from the future so as to be made valuable for Time-experience and valid for Time-activity. But, behind, all is known and ready for use according to the will of the Self in its dealings with Time and Space and Causality.
Chapter XXX

Memory, Ego and Self-Experience

ARGUMENT

Consciousness of Self has two different aspects, the awareness of a stable, immutable and timeless Self beyond mentality and the awareness of a various self-experience in the process of Time and the field of Space. There is a constant shifting of the point of Time, a constant though less obvious changing of the habitation and the environment and in these a constant subjective modifying of the experience of the states of personality and the experience of the environment. — Memory here is an indispensable factor in the linking of past and present experience and is necessary to secure its continuity and coherence. Still Memory is not all; it is only a mediator between the mind-sense and the coordinating mind. — It is the mind-sense which shapes the object of experience as a wave of the conscious being into a movement of emotion, vitality, sensation or thought-perception. There is also an act of mental observation and valuation of this wave in the sense-mind. There is also the subject or mental being who thus modifies his mental becoming and observes and values it by an act of mind. It is when the mental being stands back from the mental becoming and even from the mental act that he begins to perceive himself as something different from all becoming, mutable in that, but immutable beyond it. He is not two selves, one that is and one that becomes, but one immutable who sees changing phenomena of his being, the immutability evident to a direct and pure self-consciousness, the mutable evident indirectly through a conditional and secondary mental consciousness. — It is the character of this indirect mental consciousness which can experience only by succession of Time that brings in the device

Chapter XXX of The Life Divine as published in the Arya was revised in 1939–40, becoming the present Book Two, Part I, Chapter IX.
of Memory. Memory is not the essence of mental experience of becoming, nor of its continuity, nor of the recurrence of the same experience or the same cause and effect in Time. These are circumstances of the movement of the stuff of conscious being and conscious force of being, a movement which is really undivided though only seen by mind in artificial divisions. Memory is a device by which the experiences of the mind-sense are linked together and these artificial divisions in Time bridged over so that the coordinating mind and will may better and better use the material of experience and impose order on its conscious knowledge of its self and its conscious action in its environment. It is an aid to our ignorance of self developing, in the evolution of mind out of inconscient force, knowledge of self by experience. — The ego-sense is a mental device by which the mental being develops towards knowledge of that which experiences as well as of that which is experienced. Memory only tells us that the successive experiences have happened in the same field of conscious being; it is the coordinating and distinguishing mind which tells us that it is the same mental being who experiences. — Mind-substance suffers the changes of becoming; mind-sense experiences them; memory assures the mind-sense of its continuity of experience; the coordinating mind of knowledge relates them together and relates them also to the ego or being who, it says, is the same in past and present whether he forgets or remembers. In the animal this may be little more than a coordination in the sense-mind by a discernment largely involved in the sensations and the memories, but in man it becomes a coordinating reason superior to sense and memory. It is by this development that the ego-sense becomes distinct and disengaged from its aids. — But it is itself only a device and basis for self-development of true self-knowledge; it is a stage in the evolution from nescience to partial knowledge and from partial knowledge to true self-consciousness. The evolving Mind becomes by it aware of an “I” that becomes and then of a self superior to the becoming. It may fix on either to the rejection of the other, but in doing so it acts on an imperfect self-knowledge. It is as yet ignorant of all even of the individual
becoming which is not superficial; ignorant of the universal becoming except indirectly, as a not-self exterior to it. Its attempt to find the true relation of the self and its becomings is based therefore on an Ignorance; that can only be truly known by an attempt to live out the relation in an integral development of self-knowledge. That is the natural goal of our evolution which is the movement of the Ignorance to exceed itself and arrive at the conscious Truth of its being and conscious knowledge of all being.
Chapter XXXI

The Boundaries of the Ignorance

ARGUMENT

We know only a part even of our superficial life and conscious becoming, fastening only on a little of our experience of self and things, memorising less, using still less for knowledge and action. What we reject, Nature stores and uses in our development, for the most part by her subconscious action. Our waking self is only a superimposition, a visible summit; the great body of our being is submerged or subliminal. — The subliminal self perceives, remembers, understands, uses all that we fail to perceive, remember or use. It provides all the material of our surface being which is only a selection from its wider existence and activity. It is only the physical and vital part of our existence which is, properly speaking, subconscient; the subliminal self is the true mental being and in relation to our waking mind it is rather secretly circumconscient; for it envelops as well as supports. Of all this larger part of our being we are ignorant. — We are ignorant also of the superconscient, that which we ordinarily call spirit or oversoul; yet this we find to be our highest and widest self, Sachchidananda creating and governing all that we are and become by His divine Maya. We are ignorant of the subliminal sea of our being which casts up the wave of our superficial existence; we are ignorant also of the superconscient ether of our being which constitutes, contains, overroofs and governs both the subliminal sea and the superficial wave. — We are ignorant of ourselves in Time, for we know only a part of the present life we are living; yet that exists only by all our past of which we are ignorant and its trend is determined by all our future of which we are still more ignorant. For our superconscient Self is eternal

Chapter XXXI of The Life Divine as published in the Arya was extensively revised in 1939–40, becoming the present Book Two, Part I, Chapter XI.

www.holybooks.com
in its being and Time is only one of its modes, our subliminal is eternal in its becoming and Time is its infinite field of experience. — We are equally ignorant of the world, holding it to be not-self, ignorant of ourselves in Space; for the world is one Self developing the movement of its conscious force in its self-conceptive extension as Space. We confine ourselves in our consciousness to a single knot of the one indivisible Matter, a single eddy of the one indivisible Life, a single station of the one indivisible Mind, a single soul-manifestation of the one indivisible Spirit. Yet it is only by knowing the One that this individual mind, life, body, soul can know itself or its action. — Thus ignorance of self is the nature of our mind, but an ignorance full of the impulse towards self-possession and self-knowledge. A many-sided Ignorance striving to become an all-embracing Knowledge is the definition of man the mental being.
Chapter XXXII

The Integral Knowledge

ARGUMENT

The ignorance in which we live is a sevenfold self-ignorance; an ignorance of the Absolute and knowledge only of the relations of being and becoming; an ignorance of our timeless and immutable self-existence and knowledge only of the cosmic becoming; an ignorance of our cosmic self and knowledge only of our egoistic existence; an ignorance of our eternal becoming in Time and knowledge only of the one life present to our memory; an ignorance of our larger and complex being in the world and knowledge only of our surface waking existence; an ignorance of the higher principles of our existence and knowledge only of the life, mind and body; an ignorance therefore of the right law and enjoyment of living and a knowledge only of the confused strife of the dualities. — Our conception of the Ignorance determines our conception of the knowledge and by that of the aim of our existence, which coincides with the ideal of the earlier Vedic thought. — We confirm by it our rejection of the extreme views which hold the absolute Non-existence or absolute Existence to be alone true and the relative world of being and becoming an ignorance to be renounced. There is the unmanifest Absolute and there is its manifestation; to fulfil the manifestation and live in the sense of it as the Absolute manifesting himself is the Knowledge. — We reject the view that regards the One, Infinite, Formless, Spirit, Superconsciente as the sole truth and the opposite terms as unreal or eventually false and vain values to be abandoned. We accept it and them also not as alternates, but as simultaneous values of the manifestation and their union in our consciousness and right use of their relations as the knowledge.

Chapter XXXII of The Life Divine as published in the Arya was extensively revised and enlarged in 1939–40, becoming the present Book Two, Part II, Chapter XV, “Reality and the Integral Knowledge”.

www.holybooks.com
— We reject equally the views that affirm a pluralistic Becoming without Being or see Mind, Life or Matter as the original principle, and we reject the limitation to our apparent Nature which is their practical conclusion. Becoming as the working out of the energies of Being, Mind, Life and Matter as inferior terms of the higher divine Nature to be illumined, uplifted, transformed by the higher terms is our view of the knowledge. — We reject also intermediate theories like that which makes God and cosmos one, — perceiving as we do that cosmos exists in God who exceeds it and not God by the cosmos, — or like that which seeks to abandon the earth and find fulfilment only in heavens where the Many enjoy the presence of the One, — perceiving, as we do, that there is a higher knowledge which leads to complete identity and that divine life based upon it need not be confined to heavens beyond, but may embrace the earth also. — Ignorance is an initial state of knowledge, the essence of which is to create a sense of limitation and division; it is this which we have to overcome and transcend without creating an opposite self-limitation. The integral aim of our existence can only be the possession and power and joy of our integral self-knowledge.
Chapter XXXIII

The Progress to Knowledge

ARGUMENT

To rise out of the sevenfold Ignorance into the integral Knowledge is the progress of man’s being; it is to grow in all his complex existence and consciousness into the full possession and enjoyment of his whole and his true being. — He starts with three categories, himself, Nature or cosmos and God, and though he tries to deny any two of these in order to affirm the third only, he cannot really succeed; for he is neither separate nor sufficient to himself, cosmos also is not sufficient to itself, but points always to an infinite, one and absolute behind it, and to affirm the Absolute to the exclusion of these two others leaves man unsatisfied and cosmos unexplained. — In affirming himself man has first to put himself in front and act and feel as if God and the world existed for him and were less important to him than himself; this is his egoistic phase necessary to disengage his individuality out of Nature and as if against her and to bring it out into force and capacity. He has to affirm himself in the Ignorance before he can perfect himself in the Knowledge. Afterwards he has to seek for himself in Nature and God and others, but it is still himself that he seeks to know and possess and his own perfection or salvation which is his motive. — In the progressive enlargement of his knowledge he gets rid of his sevenfold ignorance; of the temporal by growing into his eternal being with its pre-existence and subsequent existence in Time; of the psychological by enlarging his self-knowing beyond the waking self into the subconscient and superconscient; of the constitutional by realising his spiritual being and its categories; of the cosmic by discovering his timeless self; of the egoistic by

www.holybooks.com
realising the cosmic consciousness; of the original by opening to the Absolute of whom Self, individual and Nature are so many faces. — At the same time he realises the unity of himself and Nature in the first three steps of knowledge, of himself and God in the others; of himself with all beings relatively in Nature and absolutely in God; of God and Nature because it is the Self who has become all these beings and the nature of the Lord which is apparent in cosmos. — The knowledge of Nature leads him to the same results as soon as he goes beyond Matter and Life to Mind; for he discovers a subconscient and superconscient, a soul in Matter, and perceives a supernature in which he realises the Self, the Spirit, the Absolute. — In the quest of God he begins by seeing him through Nature and himself, crudely and obscurely at first, till he finds more luminously the one Truth behind all religions; for all seize on the Divine in many aspects and their variety is necessary in order that man should come to know God entirely. — When he arrives at the unity of his knowledge of God, man and Nature, he has the complete knowledge, the sense and goal of humanity's progress and labour and the sure foundation of all perfections and all harmonies.
APPENDIX I

Chapter I

The Human Aspiration

ARGUMENT IN BRIEF

A search for God, (for a spiritual or divine Reality within oneself and behind, above or within the phenomenon of existence,) for perfection, for freedom, for an absolute Truth and Bliss, for immortality has been the persistent preoccupation of the highest human thought since the earliest times. This preoccupation seems to be a perpetual element in man’s nature; for it survives the longest periods of scepticism.

This aspiration is in contradiction with his present existence and normal experience of himself which is that of a mortal being full of imperfections, ego-ridden, largely animal, subject to transitory joys and much pain and suffering, bound by mechanical necessity. But the direct contradiction between what he is and what he seeks to be need not be a final argument against the validity of his aspiration. For such contradictions are part of Nature’s general method; the aspiration may be realisable either by a revolutionary individual effort or by an evolutionary general progress.

The problems of existence are problems of harmony. Discords and disorder of the materials, oppositions, demand a solution by accordance, by the discovery of a harmony. Thus the accordance of an inanimation and inertia in a containing Matter and the active indwelling stress of Life is Nature’s first problem, its initial difficulty; its perfect solution would be immortality in a material body. The accordance of an unconscious Matter and

In December 1940 Sri Aurobindo wrote an “Argument in Brief” and a shorter summary of Book One, Chapter I of the revised Life Divine. Around the same time he drafted a summary of Book One, Chapter XXIV. These summaries, similar to the “arguments” published in the Arya, are reproduced here from his manuscripts.

www.holybooks.com
an unconscious or half-conscious Life with a conscious Mind and Will is her second problem; the possession of a direct and perfect instrumentation of knowledge in a living body would be its complete solution. The accordance of a mortal mind, life and body with a secretly indwelling immortal spirit is the final problem; the spiritualisation or divinisation of mind, life and body, a divine life, would be the perfect solution. The search after these solutions by the human being is not irrational; it is rather the very effort and striving of Nature within him.

Life appears in Matter, Mind in Life because they are already there. Matter is a form of veiled Life; Life a form of veiled Mind; Mind may well be a form and veil of a higher power, the Spirit, which is supramental in its nature. Nature has implanted an impulse towards life in certain forms of Matter and evolves it there, a similar evolutionary impulse towards mind in certain forms of life, an impulse in certain minds towards what is beyond Mind, towards the unveiling of Spirit, the evolution of a spiritual being. Each impulse justifies itself by the creation of the necessary organs and faculties.

There is therefore no reason to put a limit to evolutionary possibility by taking our present organisation or status of existence as final. The animal is a laboratory in which Nature has worked out man; man may very well be a laboratory in which she wills to work out superman, to disclose the soul as a divine being, to evolve a divine nature.

SHORTER SYNOPSIS OF THE CHAPTER

Man’s highest aspiration has been always a seeking for God, perfection, freedom, an absolute truth and bliss, immortality.

A direct contradiction exists between this aspiration and his present state of mortality, imperfection, bondage to mechanical necessity, ego and animality.

This contradiction between what he is now and what he seeks to be is not a final argument against his aspiration. Contradictions are part of Nature’s method; the aspiration may be achievable by individual effort or by an evolutionary progress.
The problems of existence are problems of harmony.

The accordance of an active life-principle with the inanimate Matter containing it is Nature’s first evolutionary problem; its complete solution would be immortality in the body.

The accordance of conscious mind with an unconscious matter and half-conscious life is her second evolutionary problem; a direct and perfect instrumentation of knowledge in a living body would be its complete solution.

The accordance of immortal spirit with a mortal mind, life and body is her third and final problem; its complete solution would be the evolution of a divine being and a divine nature.

As Nature has implanted the impulse to life in matter, to mind in life, so she has implanted in mind the impulse towards the evolution of what is beyond mind, spiritual, supramental. Each impulse justifies itself by the creation of the necessary organs and faculties.

The animal is a laboratory in which she has worked out man; man may be a laboratory in which she wills to work out the superman, the being of a divine nature.
APPENDIX II
Chapter XXIV

Matter

Life then is not an inexplicable dream or impossible evil; it is a force of being, a pulsation of the divine All-existence capable of divine outflowering. But there still remains the problem of Matter.

This problem is of a fundamental importance. For all here, mind, life, body, depend on Matter, evolve out of it; Matter is their support, conditions their emergence and action. Man rose out of the animal by developing a body capable of a progressive mental illumination; to rise beyond himself to a divine manhood or supermanhood he must develop a physical instrumentation or body capable of a still greater supramental illumination.

But the body seems to be from the beginning the soul's great obstacle. Its opposition is a compelling cause of asceticism and of the condemnation put by most religions upon Matter.

The conflict begins with Life and increases as higher principles evolve. There is a discord between Life and Matter ending in death, the defeat of Life; but really there is a constant compromise, Life using Matter and even death for its own continuance: Mind struggles with the limitations of life and matter, and there is a half victory, a constant compromise. When spirit awakens to itself it finds itself hampered by mind, life and body, oppressed by its instruments. The solution proposed is to carry this discord to its logical conclusion. Life rejects body, mind rejects life, the spirit abandons its instruments and departs from world into its own infinity.

This solution is not a solution, it is only the individual's escape from the problem; the labour of the world and its discord continues. But if Sachchidananda is the world's indwelling reality, discord cannot be the fundamental principle. The real
solution must be a true and complete conquest and taking up of body by life, of life by mind, of all three by the spirit.

This can seem possible only when we have found the real truth of Matter as of Soul, Mind and Life. As Life is found to be force of Spirit, and Mind to be consciousness of Spirit, so Matter is found to be body and substance of Spirit.

Matter as a thing in itself is non-existent. What we see of it is a form or forms created by a particular relation between our sense-experience and the all-existence in which we move. Science discovers that Matter resolves into forms of Energy; Philosophy discovers that Matter is only a substantial appearance and the one reality is Spirit. But what brings about this phenomenon of forms of Energy or this appearance of Spirit?

There should be only states of spirit or currents of Energy; whence these phenomena of forms? It can be attributed to an action of consciousness, an intervention of Mind,—sense-mind creates the forms it seems to perceive; Thought works upon them and gives them their values. But the embodied individual thought or sense which thus conceives or perceives is itself a creation and cannot be the creator. There must be a universal Mind not known to us because subconscious to us in the form of the universe, superconscious to us in the spirit. Such a universal Mind may have determined and constructed the relations of form with form and the rhythms of the universe.¹

But how is this done?

Existence in its activity is a Consciousness-Force which presents the workings of its Force to its consciousness as forms of being. The Force of Existence of the one sole conscious being can by its workings produce no results that are not forms of that Being. Matter as substance of forms must then be itself a form or substance of spirit; it can be nothing else.

The appearances it assumes, the phenomena of Matter are the result of the dividing action of Mind. Consciousness

¹ The embodied individual mind is a surface fragmentation of the universal consciousness repeating by its perceptions this creation and so by a sort of reflection creating for its own thought and sense its own perceptual and conceptual universe.
descending from Supermind appears as Mind, an inferior power of Supermind, Force appears as Life, an energy instrumental to Mind; Mind descending into Life becomes by involution in it subconscient and gives to the material workings of Life the appearance of inconscience. The inconscience, inertia, atomic disaggregation of Matter is due to this involved action of Mind. The creative life-energy of Mind involved in Matter and there turned into what appears to us as an inconscient material Energy gives to form or substance of being on which it works the aspect of inconscience. Mind here is a first action of Supermind in the involutionary descent working in these conditions, separated from the Supermind, Life is a similar action of Force of Being, Matter the form taken by Being itself as a result of this working.

The fragmentation of Matter is due to the dividing action of Mind which does not abrogate the essential unity of Existence. The object is to push the principle of Multiplicity in the One to its extreme which can only be done by division and separativeness of consciousness and of form. For an awareness of things from separate centres of consciousness is meant to be the basic experience of existence here. The movement of Mind the dividing principle makes the knower regard the forms of his own universal being as other than he, but it has also a movement of union which heals this phenomenal division. In divine Mind the two actions are simultaneous and prevent the division from being real. In ignorant or involved Mind the division seems real; the movement towards union becomes a contact of consciousness and primarily a contact of sense. Material substance is the form in which Mind acting through sense contacts being as object,—as a general object, a mass of objective existence and a multitude of objects in that mass of being.
Part Four

From the *Standard Bearer*

1920
Ourselves

The “STANDARD BEARER” comes into the field today entrusted with a special mission and as the bearer of an ideal and a message. The standard it carries is not that of an outward battle, but the ensign of a spiritual ideal and of a life that must be its expression and the growing body of its reality. Our endeavour shall be to prepare the paths and to accomplish the beginning of a great and high change which we believe to be and aim at making the future of the race and the future of India. Our ideal is a new birth of humanity into the spirit; our life must be a spiritually inspired effort to create a body of action for that great new birth and creation.

A spiritual ideal has always been the characteristic idea and aspiration of India. But the progress of Time and the need of humanity demand a new orientation and another form of that ideal. The old forms and methods are no longer sufficient for the purpose of the Time-Spirit. India can no longer fulfil herself on lines that are too narrow for the great steps she has to take in the future. Nor is ours the spirituality of a life that is aged and world-weary and burdened with the sense of the illusion and miserable inutility of all God’s mighty creation. Our ideal is not the spirituality that withdraws from life but the conquest of life by the power of the spirit. It is to accept the world as an effort of manifestation of the Divine, but also to transform humanity by a greater effort of manifestation than has yet been accomplished, one in which the veil between man and God shall be removed, the divine manhood of which we are capable shall come to birth and our life shall be remoulded in the truth and light and power of the spirit. It is to make of all our action a sacrifice to the master of our action and an expression of the greater self in man and of all life a Yoga.

The West has made the growth of the intellectual, emotional,
vital and material being of man its ideal, but it has left aside the
greater possibilities of his spiritual existence. Its highest stan-
dards are ideals of progress, of liberty, equality and fraternity, of
reason and science, of efficiency of all kinds, of a better political,
social and economical state, of the unity and earthly happiness
of the race. These are great endeavours, but experiment after
experiment has shown that they cannot be realised in their truth
by the power of the idea and the sentiment alone: their real truth
and practice can only be founded in the spirit. The West has put
its faith in its science and machinery and it is being destroyed by
its science and crushed under its mechanical burden. It has not
understood that a spiritual change is necessary for the accom-
plishment of its ideals. The East has the secret of that spiritual
change, but it has too long turned its eyes away from the earth.
The time has now come to heal the division and to unite life and
the spirit.

This secret too has been possessed but not sufficiently prac-
tised by India. It is summarised in the rule of the Gita, yoga\th  
kuru karm\ni. Its principle is to do all actions in Yoga, in union
with God, on the foundation of the highest self and through the
rule of all our members by the power of the spirit. And this we
believe to be not only possible for man but the true solution
of all his problems and difficulties. This then is the message we
shall constantly utter and this the ideal that we shall put before
the young and rising India, a spiritual life that shall take up all
human activities and avail to transfigure the world for the great
age that is coming. India, she that has carried in herself from of
old the secret, can alone lead the way in this great transformation
of which the present sandhya of the old yuga is the forerunner.
This must be her mission and service to humanity,—as she
discovered the inner spiritual life for the individual, so now to
discover for the race its integral collective expression and found
for mankind its new spiritual and communal order.

Our first object shall be to declare this ideal, insist on the
spiritual change as the first necessity and group together all who
accept it and are ready to strive sincerely to fulfil it: our second
shall be to build up not only an individual but a communal life
on this principle. An outer activity as well as an inner change is needed and it must be at once a spiritual, cultural, educational, social and economical action. Its scope, too, will be at once individual and communal, regional and national, and eventually a work not only for the nation but for the whole human people. The immediate object of this action will be a new creation, a spiritual education and culture, an enlarged social spirit founded not on division but on unity, on the perfect growth and freedom of the individual, but also on his unity with others and his dedication to a larger self in the people and in humanity, and the beginning of an endeavour towards the solution of the economic problem founded not on any Western model but on the communal principle native to India.

Our call is to young India. It is the young who must be the builders of the new world,—not those who accept the competitive individualism, the capitalism or the materialistic communism of the West as India’s future ideal, nor those who are enslaved to old religious formulas and cannot believe in the acceptance and transformation of life by the spirit, but all who are free in mind and heart to accept a completer truth and labour for a greater ideal. They must be men who will dedicate themselves not to the past or the present but to the future. They will need to consecrate their lives to an exceeding of their lower self, to the realisation of God in themselves and in all human beings and to a whole-minded and indefatigable labour for the nation and for humanity. This ideal can be as yet only a little seed and the life that embodies it a small nucleus, but it is our fixed hope that the seed will grow into a great tree and the nucleus be the heart of an ever extending formation. It is with a confident trust in the spirit that inspires us that we take our place among the standard-bearers of the new humanity that is struggling to be born amidst the chaos of a world in dissolution and of the future India, the greater India of the rebirth that is to rejuvenate the mighty outworn body of the ancient Mother.
Part Five

From the *Bulletin of Physical Education*

1949–1950
The Supramental Manifestation upon Earth
I TAKE the opportunity of the publication of this issue of the “Bulletin d'Éducation Physique” of the Ashram to give my blessings to the Journal and the Association — J.S.A.S.A. (Jeunesse Sportive de l’Ashram de Sri Aurobindo). In doing so I would like to dwell for a while on the deeper *raison d’être* of such Associations and especially the need and utility for the nation of a widespread organisation of them and such sports or physical exercises as are practised here. In their more superficial aspect they appear merely as games and amusements which people take up for entertainment or as a field for the outlet of the body’s energy and natural instinct of activity or for a means of the development and maintenance of the health and strength of the body; but they are or can be much more than that: they are also fields for the development of habits, capacities and qualities which are greatly needed and of the utmost service to a people in war or in peace, and in its political and social activities, in most indeed of the provinces of a combined human endeavour. It is to this which we may call the national aspect of the subject that I would wish to give especial prominence.

In our own time these sports, games and athletics have assumed a place and command a general interest such as was seen only in earlier times in countries like Greece, Greece where all sides of human activity were equally developed and the gymnasium, chariot-racing and other sports and athletics had the same importance on the physical side as on the mental side the Arts and poetry and the drama, and were especially stimulated and attended to by the civic authorities of the city state. It was Greece that made an institution of the Olympiad and the recent re-establishment of the Olympiad as an international institution is a significant sign of the revival of the ancient spirit. This kind of interest has spread to a certain extent to our own country and
India has begun to take a place in international contests such as the Olympiad. The newly founded State in liberated India is also beginning to be interested in developing all sides of the life of the nation and is likely to take an active part and a habit of direction in fields which were formerly left to private initiative. It is taking up, for instance, the question of the foundation and preservation of health and physical fitness in the nation and the spreading of a general recognition of its importance. It is in this connection that the encouragement of sports and associations for athletics and all activities of this kind would be an incalculable assistance. A generalisation of the habit of taking part in such exercises in childhood and youth and early manhood would help greatly towards the creation of a physically fit and energetic people.

But of a higher import than the foundation, however necessary, of health, strength and fitness of the body is the development of discipline and morale and sound and strong character towards which these activities can help. There are many sports which are of the utmost value towards this end, because they help to form and even necessitate the qualities of courage, hardihood, energetic action and initiative or call for skill, steadiness of will or rapid decision and action, the perception of what is to be done in an emergency and dexterity in doing it. One development of the utmost value is the awakening of the essential and instinctive body consciousness which can see and do what is necessary without any indication from mental thought and which is equivalent in the body to swift insight in the mind and spontaneous and rapid decision in the will. One may add the formation of a capacity for harmonious and right movements of the body, especially in a combined action, economical of physical effort and discouraging waste of energy, which result from such exercises as marches or drill and which displace the loose and straggling, the inharmonious or disorderly or wasteful movements common to the untrained individual body. Another invaluable result of these activities is the growth of what has been called the sporting spirit. That includes good humour and tolerance and consideration for all, a right attitude and friendliness to competitors and rivals, self-control and scrupulous observance
of the laws of the game, fair play and avoidance of the use of foul means, an equal acceptance of victory or defeat without bad humour, resentment or ill-will towards successful competitors, loyal acceptance of the decisions of the appointed judge, umpire or referee. These qualities have their value for life in general and not only for sport, but the help that sport can give to their development is direct and invaluable. If they could be made more common not only in the life of the individual but in the national life and in the international where at the present day the opposite tendencies have become too rampant, existence in this troubled world of ours would be smoother and might open to a greater chance of concord and amity of which it stands very much in need. More important still is the custom of discipline, obedience, order, habit of team-work, which certain games necessitate. For without them success is uncertain or impossible. Innumerable are the activities in life, especially in national life, in which leadership and obedience to leadership in combined action are necessary for success, victory in combat or fulfilment of a purpose. The role of the leader, the captain, the power and skill of his leadership, his ability to command the confidence and ready obedience of his followers is of the utmost importance in all kinds of combined action or enterprise; but few can develop these things without having learned themselves to obey and to act as one mind or as one body with others. This strictness of training, this habit of discipline and obedience is not inconsistent with individual freedom; it is often the necessary condition for its right use, just as order is not inconsistent with liberty but rather the condition for the right use of liberty and even for its preservation and survival. In all kinds of concerted action this rule is indispensable: orchestration becomes necessary and there could be no success for an orchestra in which individual musicians played according to their own fancy and refused to follow the indications of the conductor. In spiritual things also the same rule holds; a sadhak who disregarded the guidance of the Guru and preferred the untrained inspirations of the novice could hardly escape the stumbles or even the disasters which so often lie thick around the path to spiritual realisation.
I need not enumerate the other benefits which can be drawn from the training that sports can give or dwell on their use in the national life; what I have said is sufficient. At any rate, in schools like ours and in universities sports have now a recognised and indispensable place; for even a highest and completest education of the mind is not enough without the education of the body. Where the qualities I have enumerated are absent or insufficiently present, a strong individual will or a national will may build them up, but the aid given by sports to their development is direct and in no way negligible. This would be a sufficient reason for the attention given to them in our Ashram, though there are others which I need not mention here. I am concerned here with their importance and the necessity of the qualities they create or stimulate for our national life. The nation which possesses them in the highest degree is likely to be the strongest for victory, success and greatness, but also for the contribution it can make towards the bringing about of unity and a more harmonious world order towards which we look as our hope for humanity’s future.
Perfection of the Body

The perfection of the body, as great a perfection as we can bring about by the means at our disposal, must be the ultimate aim of physical culture. Perfection is the true aim of all culture, the spiritual and psychic, the mental, the vital and it must be the aim of our physical culture also. If our seeking is for a total perfection of the being, the physical part of it cannot be left aside; for the body is the material basis, the body is the instrument which we have to use. Šarīrāṁ khalu dharmasādhanam, says the old Sanskrit adage,—the body is the means of fulfilment of dharma, and dharma means every ideal which we can propose to ourselves and the law of its working out and its action. A total perfection is the ultimate aim which we set before us, for our ideal is the Divine Life which we wish to create here, the life of the Spirit fulfilled on earth, life accomplishing its own spiritual transformation even here on earth in the conditions of the material universe. That cannot be unless the body too undergoes a transformation, unless its action and functioning attain to a supreme capacity and the perfection which is possible to it or which can be made possible.

I have already indicated in a previous message a relative perfection of the physical consciousness in the body and of the mind, the life, the character which it houses as, no less than an awakening and development of the body’s own native capacities, a desirable outcome of the exercises and practices of the physical culture to which we have commenced to give in this Ashram a special attention and scope. A development of the physical consciousness must always be a considerable part of our aim, but for that the right development of the body itself is an essential element; health, strength, fitness are the first needs, but the physical frame itself must be the best possible. A divine life in a material world implies necessarily a union of the two ends.
of existence, the spiritual summit and the material base. The soul with the basis of its life established in Matter ascends to the heights of the Spirit but does not cast away its base, it joins the heights and the depths together. The Spirit descends into Matter and the material world with all its lights and glories and powers and with them fills and transforms life in the material world so that it becomes more and more divine. The transformation is not a change into something purely subtle and spiritual to which Matter is in its nature repugnant and by which it is felt as an obstacle or as a shackle binding the Spirit; it takes up Matter as a form of the Spirit though now a form which conceals and turns it into a revealing instrument, it does not cast away the energies of Matter, its capacities, its methods; it brings out their hidden possibilities, uplifts, sublimates, discloses their innate divinity. The divine life will reject nothing that is capable of divinisation; all is to be seized, exalted, made utterly perfect. The mind now still ignorant, though struggling towards knowledge, has to rise towards and into the supramental light and truth and bring it down so that it shall suffuse our thinking and perception and insight and all our means of knowing till they become radiant with the highest truth in their inmost and outermost movements. Our life, still full of obscurity and confusion and occupied with so many dull and lower aims, must feel all its urges and instincts exalted and irradiated and become a glorious counterpart of the supramental super-life above. The physical consciousness and physical being, the body itself must reach a perfection in all that it is and does which now we can hardly conceive. It may even in the end be suffused with a light and beauty and bliss from the Beyond and the life divine assume a body divine.

But first the evolution of the nature must have reached a point at which it can meet the Spirit direct, feel the aspiration towards the spiritual change and open itself to the workings of the Power which shall transform it. A supreme perfection, a total perfection is possible only by a transformation of our lower or human nature, a transformation of the mind into a thing of light, our life into a thing of power, an instrument of right action, right use for all its forces, of a happy elevation of its being.
lifting it beyond its present comparatively narrow potentiality for a self-fulfilling force of action and joy of life. There must be equally a transforming change of the body by a conversion of its action, its functioning, its capacities as an instrument beyond the limitations by which it is clogged and hampered even in its greatest present human attainment. In the totality of the change we have to achieve, human means and forces too have to be taken up, not dropped but used and magnified to their utmost possibility as part of the new life. Such a sublimation of our present human powers of mind and life into elements of a divine life on earth can be conceived without much difficulty; but in what figure shall we conceive the perfection of the body?

In the past the body has been regarded by spiritual seekers rather as an obstacle, as something to be overcome and discarded than as an instrument of spiritual perfection and a field of the spiritual change. It has been condemned as a grossness of Matter, as an insuperable impediment and the limitations of the body as something unchangeable making transformation impossible. This is because the human body even at its best seems only to be driven by an energy of life which has its own limits and is debased in its smaller physical activities by much that is petty or coarse or evil; the body in itself is burdened with the inertia and inconscience of Matter, only partly awake and, although quickened and animated by a nervous activity, subconscious in the fundamental action of its constituent cells and tissues and their secret workings. Even in its fullest strength and force and greatest glory of beauty, it is still a flower of the material Inconscience; the inconscient is the soil from which it has grown and at every point opposes a narrow boundary to the extension of its powers and to any effort of radical self-exceeding. But if a divine life is possible on earth, then this self-exceeding must also be possible.

In the pursuit of perfection we can start at either end of our range of being and we have then to use, initially at least, the means and processes proper to our choice. In Yoga the process is spiritual and psychic; even its vital and physical processes are given a spiritual or psychic turn and raised to a higher motion
than belongs properly to the ordinary life and Matter, as for instance in the Hathayogic and Rajayogic use of the breathing or the use of Asana. Ordinarily a previous preparation of the mind and life and body is necessary to make them fit for the reception of the spiritual energy and the organisation of psychic forces and methods, but this too is given a special turn proper to the Yoga. On the other hand, if we start in any field at the lower end we have to employ the means and processes which Life and Matter offer to us and respect the conditions and what we may call the technique imposed by the vital and the material energy. We may extend the activity, the achievement, the perfection attained beyond the initial, even beyond the normal possibilities but still we have to stand on the same base with which we started and within the boundaries it gives to us. It is not that the action from the two ends cannot meet and the higher take into itself and uplift the lower perfection; but this can usually be done only by a transition from the lower to a higher outlook, aspiration and motive: this we shall have to do if our aim is to transform the human into the divine life. But here there comes in the necessity of taking up the activities of human life and sublimating them by the power of the spirit. Here the lower perfection will not disappear; it will remain but will be enlarged and transformed by the higher perfection which only the power of the spirit can give. This will be evident if we consider poetry and art, philosophic thought, the perfection of the written word or the perfect organisation of earthly life: these have to be taken up and the possibilities already achieved or whatever perfection has already been attained included in a new and greater perfection but with the larger vision and inspiration of a spiritual consciousness and with new forms and powers. It must be the same with the perfection of the body.

The taking up of life and Matter into what is essentially a spiritual seeking, instead of the rejection and ultimate exclusion of them which was the attitude of a spirituality that shunned or turned away from life in the world, involves certain developments which a spiritual institution of the older kind could regard as foreign to its purpose. A divine life in the world or
an institution having that for its aim and purpose cannot be or cannot remain something outside or entirely shut away from the life of ordinary men in the world or unconcerned with the mundane existence; it has to do the work of the Divine in the world and not a work outside or separate from it. The life of the ancient Rishis in their Ashramas had such a connection; they were creators, educators, guides of men and the life of the Indian people in ancient times was largely developed and directed by their shaping influence. The life and activities involved in the new endeavour are not identical but they too must be an action upon the world and a new creation in it. It must have contacts and connections with it and activities which take their place in the general life and whose initial or primary objects may not seem to differ from those of the same activities in the outside world. In our Ashram here we have found it necessary to establish a school for the education of the children of the resident sadhaks, teaching upon familiar lines though with certain modifications and taking as part and an important part of their development an intensive physical training which has given form to the sports and athletics practised by the Jeunesse Sportive of the Ashram and of which this Bulletin is the expression. It has been questioned by some what place sports can have in an Ashram created for spiritual seekers and what connection there can be between spirituality and sports. The first answer lies in what I have already written about the connections of an institution of this kind with the activities of the general life of men and what I have indicated in the previous number as to the utility such a training can have for the life of a nation and its benefit for the international life. Another answer can occur to us if we look beyond first objects and turn to the aspiration for a total perfection including the perfection of the body.

In the admission of an activity such as sports and physical exercises into the life of the Ashram it is evident that the methods and the first objects to be attained must belong to what we have called the lower end of the being. Originally they have been introduced for the physical education and bodily development of the children of the Ashram School, and these are too young
for a strictly spiritual aim or practice to enter into their activities and it is not certain that any great number of them will enter the spiritual life when they are of an age to choose what shall be the direction of their future. The object must be the training of the body and the development of certain parts of mind and character so far as this can be done by or in connection with this training, and I have already indicated in a previous number how and in what directions this can be done. It is a relative and human perfection that can be attained within these limits; anything greater can be reached only by the intervention of higher powers, psychic powers, the power of the spirit. Yet what can be attained within the human boundaries can be something very considerable and sometimes immense: what we call genius is part of the development of the human range of being, and its achievements, especially in things of the mind and will, can carry us half-way to the divine. Even what the mind and will can do with the body in the field proper to the body and its life, in the way of physical achievement, bodily endurance, feats of prowess of all kinds, a lasting activity refusing fatigue or collapse and continuing beyond what seems at first to be possible, courage and refusal to succumb under an endless and murderous physical suffering, these and other victories of many kinds sometimes approaching or reaching the miraculous are seen in the human field and must be reckoned as a part of our concept of a total perfection. The unflinching and persistent reply that can be made by the body as well as the mind of man and by his life-energy to whatever call can be imposed on it in the most difficult and discouraging circumstances by the necessities of war and travel and adventure is of the same kind, and their endurance can reach astounding proportions and even the inconscient in the body seems to be able to return a surprising response.

The body, we have said, is a creation of the Inconscient and itself inconscient or at least subconscient in parts of itself and much of its hidden action; but what we call the Inconscient is an appearance, a dwelling place, an instrument of a secret Consciousness or a Superconscient which has created the miracle we call the universe. Matter is the field and the creation of the
Inconscient and the perfection of the operations of inconscient Matter, their perfect adaptation of means to an aim and end, the wonders they perform and the marvels of beauty they create, testify, in spite of all the ignorant denial we can oppose, to the presence and power of consciousness of this Superconscience in every part and movement of the material universe. It is there in the body, has made it and its emergence in our consciousness is the secret aim of evolution and the key to the mystery of our existence.

In the use of such activities as sports and physical exercises for the education of the individual in childhood and first youth, which should mean the bringing out of his actual and latent possibilities to their fullest development, the means and methods we must use are limited by the nature of the body and its aim must be such relative human perfection of the body’s powers and capacities and the powers of mind, will, character, action of which it is at once the residence and the instrument so far as these methods can help to develop them. I have written sufficiently about the mental and moral parts of perfection to which these pursuits can contribute and this I need not repeat here. For the body itself the perfections that can be developed by these means are those of its natural qualities and capacities and, secondly, the training of its general fitness as an instrument for all the activities which may be demanded from it by the mind and the will, by the life-energy or by the dynamic perceptions, impulses and instincts of our subtle physical being which is an unrecognised but very important element and agent in our nature. Health and strength are the first conditions for the natural perfection of the body, not only muscular strength and the solid strength of the limbs and physical stamina, but the finer, alert and plastic and adaptable force which our nervous and subtle physical parts can put into the activities of the frame. There is also the still more dynamic force which a call upon the life-energies can bring into the body and stir it to greater activities, even feats of the most extraordinary character of which in its normal state it would not be capable. There is also the strength which the mind and will by their demands and stimulus and by their secret powers...
which we use or by which we are used without knowing clearly the source of their action can impart to the body or impose upon it as masters and inspirers.

Among the natural qualities and powers of the body which can be thus awakened, stimulated and trained to a normal activity we must reckon dexterity and stability in all kinds of physical action, such as swiftness in the race, dexterity in combat, skill and endurance of the mountaineer, the constant and often extraordinary response to all that can be demanded from the body of the soldier, sailor, traveller or explorer to which I have already made reference, or in adventure of all kinds and all the wide range of physical attainment to which man has accustomed himself or to which he is exceptionally pushed by his own will or by the compulsion of circumstance. It is a general fitness of the body for all that can be asked from it which is the common formula of all this action, a fitness attained by a few or by many, that could be generalised by an extended and many-sided physical education and discipline. Some of these activities can be included under the name of sports; there are others for which sports and physical exercises can be an effective preparation. In some of them a training for common action, combined movement, discipline are needed and for that our physical exercises can make one ready; in others a developed individual will, skill of mind and quick perception, forcefulness of life-energy and subtle physical impulsion are more prominently needed and may even be the one sufficient trainer. All must be included in our conception of the natural powers of the body and its capacity and instrumental fitness in the service of the human mind and will, and therefore in our concept of the total perfection of the body.

There are two conditions for this perfection, an awakening in as great an entirety as possible of the body consciousness and an education, an evocation of its potentialities, also as entire and fully developed and, it may be, as many-sided as possible. The form or body is, no doubt, in its origin a creation of the Inconscient and limited by it on all sides, but still of the Inconscient developing the secret consciousness concealed within
it and growing in light of knowledge, power and Ananda. We have to take it at the point it has reached in its human evolution in these things, make as full a use of them as may be and, as much as we can, further this evolution to as high a degree as is permitted by the force of the individual temperament and nature. In all forms in the world there is a force at work, unconsciously active or oppressed by inertia in its lower formulations, but in the human being conscious from the first, with its potentialities partly awake, partly asleep or latent: what is awake in it we have to make fully conscious; what is asleep we have to arouse and set to its work; what is latent we have to evoke and educate. Here there are two aspects of the body consciousness, one which seems to be a kind of automatism carrying on its work in the physical plane without any intervention of the mind and in parts even beyond any possibility of direct observation by the mind or, if conscious or observable, still proceeding or capable of continuing, when once started, by an apparently mechanical action not needing direction by the mind and continuing so long as the mind does not intervene.

There are other movements taught and trained by the mind which can yet go on operating automatically but faultlessly even when not attended to by the thought or will; there are others which can operate in sleep and produce results of value to the waking intelligence. But more important is what may be described as a trained and developed automatism, a perfected skill and capacity of eye and ear and the hands and all the members prompt to respond to any call made on them, a developed spontaneous operation as an instrument, a complete fitness for any demand that the mind and life-energy can make upon it. This is ordinarily the best we can achieve at the lower end, when we start from that end and limit ourselves to the means and methods which are proper to it. For more we have to turn to the mind and life-energy themselves or to the energy of the spirit and to what they can do for a greater perfection of the body. The most we can do in the physical field by physical means is necessarily insecure as well as bound by limits; even what seems a perfect health and strength of the body is precarious and can be broken down at
any moment by fluctuations from within or by a strong attack or shock from outside: only by the breaking of our limitations can a higher and more enduring perfection come. One direction in which our consciousness must grow is an increasing hold from within or from above on the body and its powers and its more conscious response to the higher parts of our being. The mind pre-eminently is man; he is a mental being and his human perfection grows the more he fulfils the description of the Upanishad, a mental being, Purusha, leader of the life and the body. If the mind can take up and control the instincts and automatisms of the life-energy and the subtle physical consciousness and the body, if it can enter into them, consciously use and, as we may say, fully mentalise their instinctive or spontaneous action, the perfection of these energies, their action too become more conscious and more aware of themselves and more perfect. But it is necessary for the mind too to grow in perfection and this it can do best when it depends less on the fallible intellect of physical mind, when it is not limited even by the more orderly and accurate working of the reason and can grow in intuition and acquire a wider, deeper and closer seeing and the more luminous drive of energy of a higher intuitive will. Even within the limits of its present evolution it is difficult to measure the degree to which the mind is able to extend its control or its use of the body’s powers and capacities and when the mind rises to higher powers still and pushes back its human boundaries, it becomes impossible to fix any limits: even, in certain realisations, an intervention by the will in the automatic working of the bodily organs seems to become possible.

Wherever limitations recede and in proportion as they recede, the body becomes a more plastic and responsive and in that measure a more fit and perfect instrument of the action of the spirit. In all effective and expressive activities here in the material world the cooperation of the two ends of our being is indispensable. If the body is unable whether by fatigue or by natural incapacity or any other cause to second the thought or will or is in any way irresponsive or insufficiently responsive, to that extent the action fails or falls short or becomes in some
degree unsatisfying or incomplete. In what seems to be an exploit of the spirit so purely mental as the outpouring of poetic inspiration, there must be a responsive vibration of the brain and its openness as a channel for the power of the thought and vision and the light of the word that is making or breaking its way through or seeking for its perfect expression. If the brain is fatigued or dulled by any clog, either the inspiration cannot come and nothing is written or it fails and something inferior is all that can come out; or else a lower inspiration takes the place of the more luminous formulation that was striving to shape itself or the brain finds it more easy to lend itself to a less radiant stimulus or else it labours and constructs or responds to poetic artifice. Even in the most purely mental activities the fitness, readiness or perfect training of the bodily instrument is a condition indispensable. That readiness, that response too is part of the total perfection of the body.

The essential purpose and sign of the growing evolution here is the emergence of consciousness in an apparently inconscient universe, the growth of consciousness and with it growth of the light and power of the being; the development of the form and its functioning or its fitness to survive, although indispensable, is not the whole meaning or the central motive. The greater and greater awakening of consciousness and its climb to a higher and higher level and a wider extent of its vision and action is the condition of our progress towards that supreme and total perfection which is the aim of our existence. It is the condition also of the total perfection of the body. There are higher levels of the mind than any we now conceive and to these we must one day reach and rise beyond them to the heights of a greater, a spiritual existence. As we rise we have to open to them our lower members and fill these with those superior and supreme dynamisms of light and power; the body we have to make a more and more and even entirely conscious frame and instrument, a conscious sign and seal and power of the spirit. As it grows in this perfection, the force and extent of its dynamic action and its response and service to the spirit must increase; the control of the spirit over it also must grow and the plasticity
of its functioning both in its developed and acquired parts of power and in its automatic responses down to those that are now purely organic and seem to be the movements of a mechanic inconscience. This cannot happen without a veritable transformation, and a transformation of the mind and life and very body is indeed the change to which our evolution is secretly moving and without this transformation the entire fullness of a divine life on earth cannot emerge. In this transformation the body itself can become an agent and a partner. It might indeed be possible for the spirit to achieve a considerable manifestation with only a passive and imperfectly conscious body as its last or bottommost means of material functioning, but this could not be anything perfect or complete. A fully conscious body might even discover and work out the right material method and process of a material transformation. For this, no doubt, the spirit’s supreme light and power and creative joy must have manifested on the summit of the individual consciousness and sent down their fiat into the body, but still the body may take in the working out its spontaneous part of self-discovery and achievement. It would be thus a participator and agent in its own transformation and the integral transformation of the whole being; this too would be a part and a sign and evidence of the total perfection of the body.

If the emergence and growth of consciousness is the central motive of the evolution and the key to its secret purpose, then by the very nature of that evolution this growth must involve not only a wider and wider extent of its capacities, but also an ascent to a higher and higher level till it reaches the highest possible. For it starts from a nethermost level of involution in the Inconscience which we see at work in Matter creating the material universe; it proceeds by an Ignorance which is yet ever developing knowledge and reaching out to an ever greater light and ever greater organisation and efficacy of the will and harmonisation of all its own inherent and emerging powers; it must at last reach a point where it develops or acquires the complete fullness of its capacity, and that must be a state or action in which there is no longer an ignorance seeking for knowledge but Knowledge self-possessed, inherent in the being, master of
its own truths and working them out with a natural vision and force that is not afflicted by limitation or error. Or if there is a limitation, it must be a self-imposed veil behind which it would keep truth back from manifestation in Time but draw it out at will and without any need of search or acquisition in the order of a right perception of things or in the just succession of that which has to be manifested in obedience to the call of Time.

This would mean an entry or approach into what might be called a truth-consciousness self-existent in which the being would be aware of its own realities and would have the inherent power to manifest them in a Time-creation in which all would be Truth following out its own unerring steps and combining its own harmonies; every thought and will and feeling and act would be spontaneously right, inspired or intuitive, moving by the light of Truth and therefore perfect. All would express inherent realities of the spirit; some fullness of the power of the spirit would be there. One would have overpassed the present limitations of mind: mind would become a seeing of the light of Truth, will a force and power of the Truth, Life a progressive fulfilment of the Truth, the body itself a conscious vessel of the Truth and part of the means of its self-effectuation and a form of its self-aware existence. It would be at least some initiation of this Truth-consciousness, some first figure and action of it that must be reached and enter into a first operation if there is to be a divine life or any full manifestation of a spiritualised consciousness in the world of Matter. Or, at the very least, such a Truth-consciousness must be in communication with our own mind and life and body, descend into touch with it, control its seeing and action, impel its motives, take hold of its forces and shape their direction and purpose. All touched by it might not be able to embody it fully, but each would give some form to it according to his spiritual temperament, inner capacity, the line of his evolution in Nature: he would reach securely the perfection of which he was immediately capable and he would be on the road to the full possession of the truth of the Spirit and of the truth of Nature.

In the workings of such a Truth-consciousness there would
be a certain conscious seeing and willing automatism of the steps of its truth which would replace the infallible automatism of the inconscient or seemingly inconscient Force that has brought out of an apparent Void the miracle of an ordered universe, and this could create a new order of the manifestation of the Being in which a perfect perfection would become possible; even a supreme and total perfection would appear in the vistas of an ultimate possibility. If we could draw down this power into the material world, our agelong dreams of human perfectibility, individual perfection, the perfectibility of the race, of society, inner mastery over self and a complete mastery, governance and utilisation of the forces of Nature could see at long last a prospect of total achievement. This complete human self-fulfilment might well pass beyond limitations and be transformed into the character of a divine life. Matter after taking into itself and manifesting the power of life and the light of mind would draw down into it the superior or supreme power and light of the spirit and in an earthly body shed its parts of inconscience and become a perfectly conscious frame of the spirit. A secure completeness and stability of the health and strength of its physical tenement could be maintained by the will and force of this inhabitant; all the natural capacities of the physical frame, all powers of the physical consciousness would reach their utmost extension and be there at command and sure of their flawless action. As an instrument the body would acquire a fullness of capacity, a totality of fitness for all uses which the inhabitant would demand of it far beyond anything now possible. Even it could become a revealing vessel of a supreme beauty and bliss, — casting the beauty of the light of the spirit suffusing and radiating from it as a lamp reflects and diffuses the luminosity of its indwelling flame, carrying in itself the beatitude of the spirit, its joy of the seeing mind, its joy of life and spiritual happiness, the joy of Matter released into a spiritual consciousness and thrilled with a constant ecstasy. This would be the total perfection of the spiritualised body.

All this might not come all at once, though such a sudden illumination might be possible if a divine Power and Light and
Ananda could take their stand on the summit of our being and send down their force into the mind and life and body illumining and remoulding the cells, awaking consciousness in all the frame. But the way would be open and the consummation of all that is possible in the individual could progressively take place. The physical also would have its share in that consummation of the whole.

There would always remain vistas beyond as the infinite Spirit took up towards higher heights and larger breadths the evolving Nature, in the movement of the liberated being towards the possession of the supreme Reality, the supreme existence, consciousness, beatitude. But of this it would be premature to speak: what has been written is perhaps as much as the human mind as it is now constituted can venture to look forward to and the enlightened thought understand in some measure. These consequences of the Truth-consciousness descending and laying its hold upon Matter would be a sufficient justification of the evolutionary labour. In this upward all-uplifting sweep of the Spirit there could be a simultaneous or consecutive downward sweep of the triumph of a spiritualised Nature all-including, all-transmuting and in it there could occur a glorifying change of Matter and the physical consciousness and physical form and functioning of which we could speak as not only the total but the supreme perfection of the body.
The Divine Body

A DIVINE life in a divine body is the formula of the ideal that we envisage. But what will be the divine body? What will be the nature of this body, its structure, the principle of its activity, the perfection that distinguishes it from the limited and imperfect physicality within which we are now bound? What will be the conditions and operations of its life, still physical in its base upon the earth, by which it can be known as divine?

If it is to be the product of an evolution, and it is so that we must envisage it, an evolution out of our human imperfection and ignorance into a greater truth of spirit and nature, by what process or stages can it grow into manifestation or rapidly arrive? The process of the evolution upon earth has been slow and tardy — what principle must intervene if there is to be a transformation, a progressive or sudden change?

It is indeed as a result of our evolution that we arrive at the possibility of this transformation. As Nature has evolved beyond Matter and manifested Life, beyond Life and manifested Mind, so she must evolve beyond Mind and manifest a consciousness and power of our existence free from the imperfection and limitation of our mental existence, a supramental or truth-consciousness, and able to develop the power and perfection of the spirit. Here a slow and tardy change need no longer be the law or manner of our evolution; it will be only so to a greater or less extent so long as a mental ignorance clings and hampers our ascent; but once we have grown into the truth-consciousness its power of spiritual truth of being will determine all. Into that truth we shall be freed and it will transform mind and life and body. Light and bliss and beauty and a perfection of the spontaneous right action of all the being are there as native powers of the supramental truth-consciousness and these will in
their very nature transform mind and life and body even here upon earth into a manifestation of the truth-conscious spirit. The obscurations of earth will not prevail against the supramental truth-consciousness, for even into the earth it can bring enough of the omniscient light and omnipotent force of the spirit to conquer. All may not open to the fullness of its light and power, but whatever does open must to that extent undergo the change. That will be the principle of transformation.

It might be that a psychological change, a mastery of the nature by the soul, a transformation of the mind into a principle of light, of the life-force into power and purity would be the first approach, the first attempt to solve the problem, to escape beyond the merely human formula and establish something that could be called a divine life upon earth, a first sketch of supermanhood, of a supramental living in the circumstances of the earth-nature. But this could not be the complete and radical change needed; it would not be the total transformation, the fullness of a divine life in a divine body. There would be a body still human and indeed animal in its origin and fundamental character and this would impose its own inevitable limitations on the higher parts of the embodied being. As limitation by ignorance and error is the fundamental defect of an untransformed mind, as limitation by the imperfect impulses and strainings and wants of desire are the defects of an untransformed life-force, so also imperfection of the potentialities of the physical action, an imperfection, a limitation in the response of its half-consciousness to the demands made upon it and the grossness and stains of its original animality would be the defects of an untransformed or an imperfectly transformed body. These could not but hamper and even pull down towards themselves the action of the higher parts of the nature. A transformation of the body must be the condition for a total transformation of the nature.

It might be also that the transformation might take place by stages; there are powers of the nature still belonging to the mental region which are yet potentialities of a growing gnosis lifted beyond our human mentality and partaking of the light
and power of the Divine and an ascent through these planes, a descent of them into the mental being might seem to be the natural evolutionary course. But in practice it might be found that these intermediate levels would not be sufficient for the total transformation since, being themselves illumined potentialities of mental being not yet supramental in the full sense of the word, they could bring down to the mind only a partial divinity or raise the mind towards that but not effectuate its elevation into the complete supramentality of the truth-consciousness. Still these levels might become stages of the ascent which some would reach and pause there while others went higher and could reach and live on superior strata of a semi-divine existence. It is not to be supposed that all humanity would rise in a block into the supermind; at first those only might attain to the highest or some intermediate height of the ascent whose inner evolution has fitted them for so great a change or who are raised by the direct touch of the Divine into its perfect light and power and bliss. The large mass of human beings might still remain for long content with a normal or only a partially illumined and uplifted human nature. But this would be itself a sufficiently radical change and initial transformation of earth-life; for the way would be open to all who have the will to rise, the supramental influence of the truth-consciousness would touch the earth-life and influence even its untransformed mass and a hope would be there and a promise eventually available to all which now only the few can share in or realise.

In any case these would be beginnings only and could not constitute the fullness of the divine life upon earth; it would be a new orientation of the earthly life but not the consummation of its change. For that there must be the sovereign reign of a supramental truth-consciousness to which all other forms of life would be subordinated and depend upon it as the master principle and supreme power to which they could look up as the goal, profit by its influences, be moved and upraised by something of its illumination and penetrating force. Especially, as the human body had to come into existence with its modification of the previous animal form and its erect figure of a new power of
life and its expressive movements and activities serviceable and necessary to the principle of mind and the life of a mental being, so too a body must be developed with new powers, activities or degrees of a divine action expressive of a truth-conscious being and proper to a supramental consciousness and manifesting a conscious spirit. While the capacity for taking up and sublimating all the activities of the earth-life capable of being spiritualised must be there, a transcendence of the original animality and the actions incurably tainted by it or at least some saving transformation of them, some spiritualising or psychicising of the consciousness and motives animating them and the shedding of whatever could not be so transformed, even a change of what might be called its instrumental structure, its functioning and organisation, a complete and hitherto unprecedented control of these things must be the consequence or incidental to this total change. These things have been already to some extent illustrated in the lives of many who have become possessed of spiritual powers but as something exceptional and occasional, the casual or incomplete manifestation of an acquired capacity rather than the organisation of a new consciousness, a new life and a new nature. How far can such physical transformation be carried, what are the limits within which it must remain to be consistent with life upon earth and without carrying that life beyond the earthly sphere or pushing it towards the supraterrrestrial existence? The supramental consciousness is not a fixed quantity but a power which passes to higher and higher levels of possibility until it reaches supreme consummations of spiritual existence fulfilling supermind as supermind fulfils the ranges of spiritual consciousness that are pushing towards it from the human or mental level. In this progression the body also may reach a more perfect form and a higher range of its expressive powers, become a more and more perfect vessel of divinity.

www.holybooks.com
This destiny of the body has rarely in the past been envisaged or else not for the body here upon earth; such forms would rather be imagined or visioned as the privilege of celestial beings and not possible as the physical residence of a soul still bound to terrestrial nature. The Vaishnavas have spoken of a spiritualised conscious body, *cinmaya deha*; there has been the conception of a radiant or luminous body, which might be the Vedic *jyotirmaya deha*. A light has been seen by some radiating from the bodies of highly developed spiritual persons, even extending to the emission of an enveloping aura and there has been recorded an initial phenomenon of this kind in the life of so great a spiritual personality as Ramakrishna. But these things have been either conceptual only or rare and occasional and for the most part the body has not been regarded as possessed of spiritual possibility or capable of transformation. It has been spoken of as the means of effectuation of the dharma and dharma here includes all high purposes, achievements and ideals of life not excluding the spiritual change: but it is an instrument that must be dropped when its work is done and though there may be and must be spiritual realisation while yet in the body, it can only come to its full fruition after the abandonment of the physical frame. More ordinarily in the spiritual tradition the body has been regarded as an obstacle, incapable of spiritualisation or transmutation and a heavy weight holding the soul to earthly nature and preventing its ascent either to spiritual fulfilment in the Supreme or to the dissolution of its individual being in the Supreme. But while this conception of the role of the body in our destiny is suitable enough for a sadhana that sees earth only as a field of the ignorance and earth-life as a preparation for a saving withdrawal from life which is the indispensable condition for spiritual liberation, it is insufficient for a sadhana which conceives of a divine life upon earth and liberation of earth-nature itself as part of a total purpose of the embodiment of the spirit here. If a total transformation of the being is our aim, a transformation of the body must be an indispensable part of it; without that no full divine life on earth is possible.

It is the past evolution of the body and especially its animal
nature and animal history which seems to stand in the way of this consummation. The body, as we have seen, is an offspring and creation of the Inconscient, itself inconscient or only half-conscious; it began as a form of unconscious Matter, developed life and from a material object became a living growth, developed mind and from the subconsciousness of the plant and the initial rudimentary mind or incomplete intelligence of the animal developed the intellectual mind and more complete intelligence of man and now serves as the physical base, container and instrumental means of our total spiritual endeavour. Its animal character and its gross limitations stand indeed as an obstacle to our spiritual perfection; but the fact that it has developed a soul and is capable of serving it as a means may indicate that it is capable of further development and may become a shrine and expression of the spirit, reveal a secret spirituality of Matter, become entirely and not only half-conscious, reach a certain oneness with the spirit. This much it must do, so far at least it must transcend its original earth-nature, if it is to be the complete instrument of the divine life and no longer an obstacle.

* *

Still the inconveniences of the animal body and its animal nature and impulses and the limitations of the human body at its best are there in the beginning and persist always so long as there is not the full and fundamental liberation, and its inconscience or half-conscience and its binding of the soul and mind and life-force to Matter, to materiality of all kinds, to the call of the unregenerated earth-nature are there and constantly oppose the call of the spirit and circumscribe the climb to higher things. To the physical being it brings a bondage to the material instruments, to the brain and heart and senses, wed to materiality and materialism of all kinds, to the bodily mechanism and its needs and obligations, to the imperative need of food and the preoccupation with the means of getting it and storing it as one of the besetting interests of life, to fatigue and sleep, to
the satisfaction of bodily desire. The life-force in man also is
tied down to these small things; it has to limit the scope of its
larger ambitions and longings, its drive to rise beyond the pull
of earth and follow the heavenlier intuitions of its psychic parts,
the heart’s ideal and the soul’s yearnings. On the mind the body
imposes the boundaries of the physical being and the physical
life and the sense of the sole complete reality of physical things
with the rest as a sort of brilliant fireworks of the imagination,
of lights and glories that can only have their full play in heavens
beyond, on higher planes of existence, but not here; it afflicts
the idea and aspiration with the burden of doubt, the evidence
of the subtle senses and the intuition with uncertainty and the
vast field of supraphysical consciousness and experience with the
imputation of unreality and clamps down to its earth-roots the
growth of the spirit from its original limiting humanity into the
supramental truth and the divine nature. These obstacles can be
overcome, the denials and resistance of the body surmounted, its
transformation is possible. Even the inconscient and animal part
of us can be illumined and made capable of manifesting the god-
nature, even as our mental humanity can be made to manifest
the superhumanity of the supramental truth-consciousness and
the divinity of what is now superconscious to us, and the total
transformation made a reality here. But for this the obligations
and compulsions of its animality must cease to be obligatory
and a purification of its materiality effected by which that very
materiality can be turned into a material solidity of the manifest-
atation of the divine nature. For nothing essential must be left out
in the totality of the earth-change; Matter itself can be turned
into a means of revelation of the spiritual reality, the Divine.

The difficulty is dual, psychological and corporeal: the first is
the effect of the unregenerated animality upon the life, especially
by the insistence of the body’s gross instincts, impulses, desires;
the second is the outcome of our corporeal structure and organic
instrumentation imposing its restrictions on the dynamism of the
higher divine nature. The first of these two difficulties is easier to
deal with and conquer; for here the will can intervene and impose
on the body the power of the higher nature. Certain of these
impulses and instincts of the body have been found especially harmful by the spiritual aspirant and weighed considerably in favour of an ascetic rejection of the body. Sex and sexuality and all that springs from sex and testifies to its existence had to be banned and discarded from the spiritual life, and this, though difficult, is not at all impossible and can be made a cardinal condition for the spiritual seeker. This is natural and unescapable in all ascetic practice and the satisfaction of this condition, though not easy at first to fulfil, becomes after a time quite feasible; the overcoming of the sex instinct and impulse is indeed binding on all who would attain to self-mastery and lead the spiritual life. A total mastery over it is essential for all spiritual seekers, the eradication of it for the complete ascetic. This much has to be recognised and not diminished in its obligatory importance and its principle.

But all recognition of the sex principle, as apart from the gross physical indulgence of the sex impulse, could not be excluded from a divine life upon earth; it is there in life, plays a large part and has to be dealt with, it cannot simply be ignored, merely suppressed or held down or put away out of sight. In the first place, it is in one of its aspects a cosmic and even a divine principle: it takes the spiritual form of the Ishwara and the Shakti and without it there could be no world-creation or manifestation of the world-principle of Purusha and Prakriti which are both necessary for the creation, necessary too in their association and interchange for the play of its psychological working and in their manifestation as soul and Nature fundamental to the whole process of the Lila. In the divine life itself an incarnation or at least in some form a presence of the two powers or their initiating influence through their embodiments or representatives would be indispensable for making the new creation possible. In its human action on the mental and vital level sex is not altogether an undivine principle; it has its nobler aspects and idealities and it has to be seen in what way and to what extent these can be admitted into the new and larger life. All gross animal indulgence of sex desire and impulse would have to be eliminated; it could only continue among those who
are not ready for the higher life or not yet ready for a complete spiritual living. In all who aspired to it but could not yet take it up in its fullness sex will have to be refined, submit to the spiritual or psychic impulse and a control by the higher mind and the higher vital and shed all its lighter, frivolous or degraded forms and feel the touch of the purity of the ideal. Love would remain, all forms of the pure truth of love in higher and higher steps till it realised its highest nature, widened into universal love, merged into the love of the Divine. The love of man and woman would also undergo that elevation and consummation; for all that can feel a touch of the ideal and the spiritual must follow the way of ascent till it reaches the divine Reality. The body and its activities must be accepted as part of the divine life and pass under this law; but, as in the other evolutionary transitions, what cannot accept the law of the divine life cannot be accepted and must fall away from the ascending nature.

Another difficulty that the transformation of the body has to face is its dependence for its very existence upon food, and here too are involved the gross physical instincts, impulses, desires that are associated with this difficult factor, the essential cravings of the palate, the greed of food and animal gluttony of the belly, the coarsening of the mind when it grovels in the mud of sense, obeys a servitude to its mere animal part and hugs its bondage to Matter. The higher human in us seeks refuge in a temperate moderation, in abstemiousness and abstinence or in carelessness about the body and its wants and in an absorption in higher things. The spiritual seeker often, like the Jain ascetics, seeks refuge in long and frequent fasts which lift him temporarily at least out of the clutch of the body’s demands and help him to feel in himself a pure vacancy of the wide rooms of the spirit. But all this is not liberation and the question may be raised whether, not only at first but always, the divine life also must submit to this necessity. But it could only deliver itself from it altogether if it could find out the way so to draw upon the universal energy that the energy would sustain not only the vital parts of our physicality but its constituent matter with no need of aid for sustenance from any outside substance of
Matter. It is indeed possible even while fasting for very long periods to maintain the full energies and activities of the soul and mind and life, even those of the body, to remain wakeful but concentrated in Yoga all the time, or to think deeply and write day and night, to dispense with sleep, to walk eight hours a day, maintaining all these activities separately or together, and not feel any loss of strength, any fatigue, any kind of failure or decadence. At the end of the fast one can even resume at once taking the normal or even a greater than the normal amount of nourishment without any transition or precaution such as medical science enjoins, as if both the complete fasting and the feasting were natural conditions, alternating by an immediate and easy passage from one to the other, of a body already trained by a sort of initial transformation to be an instrument of the powers and activities of Yoga. But one thing one does not escape and that is the wasting of the material tissues of the body, its flesh and substance. Conceivably, if a practicable way and means could only be found, this last invincible obstacle too might be overcome and the body maintained by an interchange of its forces with the forces of material Nature, giving to her her need from the individual and taking from her directly the sustaining energies of her universal existence. Conceivably, one might rediscover and re-establish at the summit of the evolution of life the phenomenon we see at its base, the power to draw from all around it the means of sustenance and self-renewal. Or else the evolved being might acquire the greater power to draw down those means from above rather than draw them up or pull them in from the environment around, all about it and below it. But until something like this is achieved or made possible we have to go back to food and the established material forces of Nature.

In fact we do, however unconsciously, draw constantly upon the universal energy, the force in Matter to replenish our material existence and the mental, vital and other potencies in the body: we do it directly in the invisible processes of interchange constantly kept up by Nature and by special means devised by her; breathing is one of these, sleep also and repose. But as her basic means for maintaining and renewing the gross physical
The Supramental Manifestation upon Earth

body and its workings and inner potencies Nature has selected the taking in of outside matter in the shape of food, its digestion, assimilation of what is assimilable and elimination of what cannot or ought not to be assimilated; this by itself is sufficient for mere maintenance, but for assuring health and strength in the body so maintained it has added the impulse towards physical exercise and play of many kinds, ways for the expenditure and renewal of energy, the choice or the necessity of manifold action and labour. In the new life, in its beginnings at least, it would not be necessary or advisable to make any call for an extreme or precipitate rejection of the need of food or the established natural method for the maintenance of the still imperfectly transformed body. If or when these things have to be transcended it must come as a result of the awakened will of the spirit, a will also in Matter itself, an imperative evolutionary urge, an act of the creative transmutations of Time or a descent from the transcendence. Meanwhile the drawing in of the universal energy by a conscious action of the higher powers of the being from around or from above, by a call to what is still to us a transcending consciousness or by an invasion or descent from the Transcendence itself, may well become an occasional, a frequent or a constant phenomenon and even reduce the part played by food and its need to an incidence no longer preoccupying, a necessity minor and less and less imperative.

Meanwhile food and the ordinary process of Nature can be accepted, although its use has to be liberated from attachment and desire and the grosser undiscriminating appetites and clutch at the pleasures of the flesh which is the way of the Ignorance; the physical processes have to be subtilised and the grossest may have to be eliminated and new processes found or new instrumentalities emerge. So long as it is accepted, a refined pleasure in it may be permitted and even a desireless ananda of taste take the place of the physical relish and the human selection by likings and dislikings which is our present imperfect response to what is offered to us by Nature. It must be remembered that for the divine life on earth, earth and Matter have not to be and cannot be rejected but have only to be sublimated and to
reveal in themselves the possibilities of the spirit, serve the spirit’s highest uses and be transformed into instruments of a greater living.

The divine life must always be actuated by the push towards perfection; a perfection of the joy of life is part and an essential part of it, the body’s delight in things and the body’s joy of life are not excluded from it; they too have to be made perfect. A large totality is the very nature of this new and growing way of existence, a fulness of the possibilities of the mind transmuted into a thing of light, of the life converted into a force of spiritual power and joy, of the body transformed into an instrument of a divine action, divine knowledge, divine bliss. All can be taken into its scope that is capable of transforming itself, all that can be an instrument, a vessel, an opportunity for the expression of this totality of the self-manifesting Spirit.

* * *

There is one problem raised by sex for those who would reject in toto the obligations imposed by the animality of the body and put forward by it as an insistent opposition in the way of the aspirant to a higher life: it is the necessity of the prolongation of the race for which the sex activity is the only means already provided by Nature for living beings and inevitably imposed upon the race. It is not indeed necessary for the individual seeker after a divine life to take up this problem or even for a group who do not seek after it for themselves alone but desire a wide acceptance of it by mankind as at least an ideal. There will always be the multitude who do not concern themselves with it or are not ready for its complete practice and to these can be left the care for the prolongation of the race. The number of those who lead the divine life can be maintained and increased, as the ideal extends itself, by the voluntary adhesion of those who are touched by the aspiration and there need be no resort to physical means for this purpose, no deviation from the rule of a strict sexual abstinence. But yet there may be circumstances in
which, from another standpoint, a voluntary creation of bodies for souls that seek to enter the earth-life to help in the creation and extension of the divine life upon earth might be found to be desirable. Then the necessity of a physical procreation for this purpose could only be avoided if new means of a supraphysical kind were evolved and made available. A development of this kind must necessarily belong to what is now considered as the sphere of the occult and the use of concealed powers of action or creation not known or possessed by the common mind of the race. Occultism means rightly the use of the higher powers of our nature, soul, mind, life-force and the faculties of the subtle physical consciousness to bring about results on their own or on the material plane by some pressure of their own secret law and its potentialities, for manifestation and result in human or earthly mind and life and body or in objects and events in the world of Matter. A discovery or an extension of these little known or yet undeveloped powers is now envisaged by some well-known thinkers as a next step to be taken by mankind in its immediate evolution; the kind of creation spoken of has not been included among these developments, but it could well be considered as one of the new possibilities. Even physical science is trying to find physical means for passing beyond the ordinary instrumentation or procedure of Nature in this matter of propagation or the renewal of the physical life-force in human or animal beings; but the resort to occult means and the intervention of subtle physical processes, if it could be made possible, would be a greater way which could avoid the limitations, degradations, incompleteness and heavy imperfection of the means and results solely available to the law of material force.

In India there has been always from the earliest times a widely spread belief in the possibility and reality of the use of these powers by men with an advanced knowledge of these secret things or with a developed spiritual knowledge and experience and dynamic force and even, in the Tantras, an organised system of their method and practice. The intervention of the Yogi in bringing about a desired birth of offspring is also generally believed in and often appealed to and the bestowal on
the child so obtained of a spiritual attainment or destiny by his will or his blessing is sometimes asked for and such a result is recorded not only in the tradition of the past but maintained by the witness of the present. But there is here still the necessity of a resort to the normal means of propagation and the gross method of physical Nature. A purely occult method, a resort to supraphysical processes acting by supraphysical means for a physical result would have to be possible if we are to avoid this necessity: the resort to the sex impulse and its animal process could not be transcended otherwise. If there is some reality in the phenomenon of materialisation and dematerialisation claimed to be possible by occultists and evidenced by occurrences many of us have witnessed, a method of this kind would not be out of the range of possibility. For in the theory of the occultists and in the gradation of the ranges and planes of our being which Yoga-knowledge outlines for us there is not only a subtle physical force but a subtle physical Matter intervening between life and gross Matter, and to create in this subtle physical substance and precipitate the forms thus made into our grosser materiality is feasible. It should be possible and it is believed to be possible for an object formed in this subtle physical substance to make a transit from its subtlety into the state of gross Matter directly by the intervention of an occult force and process, whether with or even without the assistance or intervention of some gross material procedure. A soul wishing to enter into a body or form for itself a body and take part in a divine life upon earth might be assisted to do so or even provided with such a form by this method of direct transmutation, without passing through birth by the sex process or undergoing any degradation or any of the heavy limitations in the growth and development of its mind and material body inevitable to our present way of existence. It might then assume at once the structure and greater powers and functionings of the truly divine material body which must one day emerge in a progressive evolution to a totally transformed existence both of life and form in a divinised earth-nature.

But what would be the internal or external form and structure and what the instrumentation of this divine body? The
material history of the development of the animal and human body has left it bound to a minutely constructed and elaborated system of organs and a precarious order of their functioning which can easily become a disorder, open to a general or local disorganisation, dependent on an easily disturbed nervous system and commanded by a brain whose vibrations are supposed to be mechanical and automatic and not under our conscious control. According to the materialist all this is a functioning of Matter alone whose fundamental reality is chemical. We have to suppose that the body is constructed by the agency of chemical elements building up atoms and molecules and cells and these again are the agents and only conductors at the basis of a complicated physical structure and instrumentation which is the sole mechanical cause of all our actions, thoughts, feelings, the soul a fiction and mind and life only a material and mechanical manifestation and appearance of this machine which is worked out and automatically driven with a figment of consciousness in it by the forces inherent in inconscient Matter. If that were the truth it is obvious that any divinisation or divine transformation of the body or of anything else would be nothing but an illusion, an imagination, a senseless and impossible chimera. But even if we suppose a soul, a conscious will at work in this body it could not arrive at a divine transformation if there were no radical change in the bodily instrument itself and in the organisation of its material workings. The transforming agent will be bound and stopped in its work by the physical organism's unalterable limitations and held up by the unmodified or imperfectly modified original animal in us. The possibility of the disorders, derangements, maladies native to these physical arrangements would still be there and could only be shut out by a constant vigilance or perpetual control obligatory on the corporeal instrument's spiritual inhabitant and master. This could not be called a truly divine body; for in a divine body an inherent freedom from all these things would be natural and perpetual; this freedom would be a normal and native truth of its being and therefore inevitable and unalterable. A radical transformation of the functioning and, it may well be, of the structure and certainly of the
too mechanical and material impulses and driving forces of the bodily system would be imperative.

What agency could we find which we could make the means of this all-important liberation and change? Something there is in us or something has to be developed, perhaps a central and still occult part of our being containing forces whose powers in our actual and present make-up are only a fraction of what could be, but if they became complete and dominant would be truly able to bring about with the help of the light and force of the soul and the supramental truth-consciousness the necessary physical transformation and its consequences. This might be found in the system of Chakras revealed by Tantric knowledge and accepted in the systems of Yoga, conscious centres and sources of all the dynamic powers of our being organising their action through the plexuses and arranged in an ascending series from the lowest physical to the highest mind centre and spiritual centre called the thousand-petalled lotus where ascending Nature, the Serpent Power of the Tantrics, meets the Brahman and is liberated into the Divine Being. These centres are closed or half-closed within us and have to be opened before their full potentiality can be manifested in our physical nature: but once they are opened and completely active, no limit can easily be set to the development of their potencies and the total transformation to be possible.

But what would be the result of the emergence of these forces and their liberated and diviner action on the body itself, what their dynamic connection with it and their transforming operation on the still existing animal nature and its animal impulses and gross material procedure? It might be held that the first necessary change would be the liberation of the mind, the life-force, the subtle physical agencies and the physical consciousness into a freer and a diviner activity, a many-dimensioned and unlimited operation of their consciousness, a large outbreak of higher powers and the sublimation of the bodily consciousness itself, of its instrumentation, capacity, capability for the manifestation of the soul in the world of Matter. The subtle senses now concealed in us might come forward into a free action and the material senses themselves become means or channels for the vision of what is
now invisible to us or the discovery of things surrounding us but at present unseizable and held back from our knowledge. A firm check might be put on the impulses of the animal nature or they might be purified and subtilised so as to become assets and not liabilities and so transformed as to be parts and processes of a diviner life. But even these changes would still leave a residue of material processes keeping the old way and not amenable to the higher control and, if this could not be changed, the rest of the transformation might itself be checked and incomplete. A total transformation of the body would demand a sufficient change of the most material part of the organism, its constitution, its processes and its set-up of nature.

Again, it might be thought that a full control would be sufficient, a knowledge and a vision of this organism and its unseen action and an effective control determining its operations according to the conscious will; this possibility has been affirmed as something already achieved and a part of the development of the inner powers in some. The cessation of the breathing while still the life of the body remained stable, the hermetic sealing up at will not only of the breath but of all the vital manifestations for long periods, the stoppage of the heart similarly at will while thought and speech and other mental workings continued unabated, these and other phenomena of the power of the will over the body are known and well-attested examples of this kind of mastery. But these are occasional or sporadic successes and do not amount to transformation; a total control is necessary and an established and customary and, indeed, a natural mastery. Even with that achieved something more fundamental might have to be demanded for the complete liberation and change into a divine body.

Again, it might be urged that the organic structure of the body no less than its basic outer form would have to be retained as a necessary material foundation for the retention of the earth-nature, the connection of the divine life with the life of earth and a continuance of the evolutionary process so as to prevent a breaking upward out of and away from it into a state of being which would properly belong to a higher plane and not
to a terrestrial divine fulfilment. The prolonged existence of the animal itself in our nature, if sufficiently transformed to be an instrument of manifestation and not an obstacle, would be necessary to preserve the continuity, the evolutionary total; it would be needed as the living vehicle, vāhana, of the emergent god in the material world where he would have to act and achieve the works and wonders of the new life. It is certain that a form of body making this connection and a bodily action containing the earth-dynamism and its fundamental activities must be there, but the connection should not be a bond or a confining limitation or a contradiction of the totality of the change. The maintenance of the present organism without any transformation of it would not but act as such a bond and confinement within the old nature. There would be a material base but it would be of the earth earthy, an old and not a new earth with a diviner psychological structure; for with that structure the old system would be out of harmony and it would be unable to serve its further evolution or even to uphold it as a base in Matter. It would bind part of the being, a lower part to an untransformed humanity and unchanged animal functioning and prevent its liberation into the superhumanity of the supramental nature. A change is then necessary here too, a necessary part of the total bodily transformation, which would divinise the whole man, at least in the ultimate result, and not leave his evolution incomplete.

This aim, it might be said, would be sufficiently served if the instrumentation of the centres and their forces reigned over all the activities of the nature with an entire domination of the body and made it both in its structural form and its organic workings a free channel and means of communication and a plastic instrument of cognition and dynamic action for all that they had to do in the material life, in the world of Matter. There would have to be a change in the operative processes of the material organs themselves and, it may well be, in their very constitution and their importance; they could not be allowed to impose their limitations imperatively on the new physical life. To begin with, they might become more clearly outer ends of the channels of communication and action, more
serviceable for the psychological purposes of the inhabitant, less blindly material in their responses, more conscious of the act and aim of the inner movements and powers which use them and which they are wrongly supposed by the material man in us to generate and to use. The brain would be a channel of communication of the form of the thoughts and a battery of their insistence on the body and the outside world where they could then become effective directly, communicating themselves without physical means from mind to mind, producing with a similar directness effects on the thoughts, actions and lives of others or even upon material things. The heart would equally be a direct communicant and medium of interchange for the feelings and emotions thrown outward upon the world by the forces of the psychic centre. Heart could reply directly to heart, the life-force come to the help of other lives and answer their call in spite of strangeness and distance, many beings without any external communication thrill with the message and meet in the secret light from one divine centre. The will might control the organs that deal with food, safeguard automatically the health, eliminate greed and desire, substitute subtler processes or draw in strength and substance from the universal life-force so that the body could maintain for a long time its own strength and substance without loss or waste, remaining thus with no need of sustenance by material aliments, and yet continue a strenuous action with no fatigue or pause for sleep or repose. The soul’s will or the mind’s could act from higher sources upon the sex centre and the sex organs so as to check firmly or even banish the grosser sexual impulse or stimulus and instead of serving an animal excitation or crude drive or desire turn their use to the storing, production and direction towards brain and heart and life-force of the essential energy, ojas, of which this region is the factory so as to support the works of the mind and soul and spirit and the higher life-powers and limit the expenditure of the energy on lower things. The soul, the psychic being, could more easily fill all with the light and turn the very matter of the body to higher uses for its own greater purpose.

This would be a first potent change, but not by any means
all that is possible or desirable. For it may well be that the evolution-
ary urge would proceed to a change of the organs themselves
in their material working and use and diminish greatly the need
of their instrumentation and even of their existence. The centres
in the subtle body, sūkṣma šārīra, of which one would become
conscious and aware of all going on in it, would pour their
energies into material nerve and plexus and tissue and radiate
them through the whole material body; all the physical life and
its necessary activities in this new existence could be maintained
and operated by these higher agencies in a freer and ampler way
and by a less burdensome and restricting method. This might
go so far that these organs might cease to be indispensable and
even be felt as too obstructive: the central force might use them
less and less and finally throw aside their use altogether. If that
happened they might waste by atrophy, be reduced to an in-
significant minimum or even disappear. The central force might
substitute for them subtle organs of a very different character
or, if anything material was needed, instruments that would be
forms of dynamism or plastic transmitters rather than what we
know as organs.

This might well be part of a supreme total transformation
of the body, though this too might not be final. To envisage
such changes is to look far ahead and minds attached to the
present form of things may be unable to give credence to their
possibility. No such limits and no such impossibility of any nec-
essary change can be imposed on the evolutionary urge. All has
not to be fundamentally changed: on the contrary, all has to be
preserved that is still needed in the totality, but all has to be
perfected. Whatever is necessary for the evolutionary purpose
for the increasing, enlarging, heightening of the consciousness,
which seems to be its central will and aim here, or the progres-
sion of its enabling means and preserving environment, has to
be kept and furthered; but what has to be overpassed, whatever
has no longer a use or is degraded, what has become unhelpful
or retarding, can be discarded and dropped on the way. That has
been evident in the history of the evolution of the body from its
beginning in elementary forms to its most developed type, the
human; there is no reason why this process should not intervene in the transition from the human into the divine body. For the manifestation or building of a divine body on earth there must be an initial transformation, the appearance of a new, a greater and more developed type, not a continuance with little modifications of the present physical form and its limited possibilities. What has to be preserved must indeed be preserved and that means whatever is necessary or thoroughly serviceable for the uses of the new life on earth; whatever is still needed and will serve its purpose but is imperfect, will have to be retained but developed and perfected; whatever is no longer of use for new aims or is a disability must be thrown aside. The necessary forms and instrumentations of Matter must remain since it is in a world of Matter that the divine life has to manifest, but their materiality must be refined, uplifted, ennobled, illumined, since Matter and the world of Matter have increasingly to manifest the indwelling Spirit.

The new type, the divine body, must continue the already developed evolutionary form; there must be a continuation from the type Nature has all along been developing, a continuity from the human to the divine body, no breaking away to something unrecognisable but a high sequel to what has already been achieved and in part perfected. The human body has in it parts and instruments that have been sufficiently evolved to serve the divine life; these have to survive in their form, though they must be still further perfected, their limitations of range and use removed, their liability to defect and malady and impairment eliminated, their capacities of cognition and dynamic action carried beyond the present limits. New powers have to be acquired by the body which our present humanity could not hope to realise, could not even dream of or could only imagine. Much that can now only be known, worked out or created by the use of invented tools and machinery might be achieved by the new body in its own power or by the inhabitant spirit through its own direct spiritual force. The body itself might acquire new means and ranges of communication with other bodies, new processes of acquiring knowledge, a new aesthetic, new potencies
of manipulation of itself and objects. It might not be impossible for it to possess or disclose means native to its own constitution, substance or natural instrumentation for making the far near and annulling distance, cognising what is now beyond the body’s cognisance, acting where action is now out of its reach or its domain, developing subtleties and plasticities which could not be permitted under present conditions to the needed fixity of a material frame. These and other numerous potentialities might appear and the body become an instrument immeasurably superior to what we can now imagine as possible. There could be an evolution from a first apprehending truth-consciousness to the utmost heights of the ascending ranges of supermind and it may pass the borders of the supermind proper itself where it begins to shadow out, develop, delineate expressive forms of life touched by a supreme pure existence, consciousness and bliss which constitute the worlds of a highest truth of existence, dynamism of tapas, glory and sweetness of bliss, the absolute essence and pitch of the all-creating Ananda. The transformation of the physical being might follow this incessant line of progression and the divine body reflect or reproduce here in a divine life on the earth something of this highest greatness and glory of the self-manifesting Spirit.
Supermind and the Life Divine

A DIVINE life upon earth, the ideal we have placed before us, can only come about by a spiritual change of our being and a radical and fundamental change, an evolution or revolution of our nature. The embodied being upon earth would have to rise out of the domination over it of its veils of mind, life and body into the full consciousness and possession of its spiritual reality, and its nature also would have to be lifted out of the consciousness and power of consciousness proper to a mental, vital and physical being into the greater consciousness and greater power of being and the larger and freer life of the spirit. It would not lose these former veils but they would no longer be veils or imperfect expressions but true manifestations; they would be changed into states of light, powers of spiritual life, vehicles of a spiritual existence. But this again could not be if mind, life and body were not taken up and transformed by a state of being and a force of being superior to them, a power of Supermind as much above our incomplete mental nature as that is above the nature of animal life and animated Matter, as it is immeasurably above the mere material nature.

The Supermind is in its very essence a truth-consciousness, a consciousness always free from the Ignorance which is the foundation of our present natural or evolutionary existence and from which nature in us is trying to arrive at self-knowledge and world-knowledge and a right consciousness and the right use of our existence in the universe. The Supermind, because it is a truth-consciousness, has this knowledge inherent in it and this power of true existence; its course is straight and can go direct to its aim, its field is wide and can even be made illimitable. This is because its very nature is knowledge: it has not to acquire knowledge but possesses it in its own right;
its steps are not from nescience or ignorance into some imperfect light, but from truth to greater truth, from right perception to deeper perception, from intuition to intuition, from illumination to utter and boundless luminousness, from growingwidenesses to the utter vasts and to very infinitude. On its summits it possesses the divine omniscience and omnipotence, but even in an evolutionary movement of its own graded self-manifestation by which it would eventually reveal its own highest heights, it must be in its very nature essentially free from ignorance and error: it starts from truth and light and moves always in truth and light. As its knowledge is always true, so too its will is always true; it does not fumble in its handling of things or stumble in its paces. In the Supermind feeling and emotion do not depart from their truth, make no slips or mistakes, do not swerve from the right and the real, cannot misuse beauty and delight or twist away from a divine rectitude. In the Supermind sense cannot mislead or deviate into the grossnesses which are here its natural imperfections and the cause of reproach, distrust and misuse by our ignorance. Even an incomplete statement made by the Supermind is a truth leading to a further truth, its incomplete action a step towards completeness. All the life and action and leading of the Supermind is guarded in its very nature from the falsehoods and uncertainties that are our lot; it moves in safety towards its perfection. Once the truth-consciousness was established here on its own sure foundation, the evolution of divine life would be a progress in felicity, a march through light to Ananda.

Supermind is an eternal reality of the divine Being and the divine Nature. In its own plane it already and always exists and possesses its own essential law of being; it has not to be created or to emerge or evolve into existence out of involution in Matter or out of non-existence, as it might seem to the view of mind which itself seems to its own view to have so emerged from life and Matter or to have evolved out of an involution in life and Matter. The nature of Supermind is always the same, a being of knowledge, proceeding from truth to truth, creating or
rather manifesting what has to be manifested by the power of a pre-existent knowledge, not by hazard but by a self-existent destiny in the being itself, a necessity of the thing in itself and therefore inevitable. Its manifestation of the divine life will also be inevitable; its own life on its own plane is divine and, if Supermind descends upon the earth, it will bring necessarily the divine life with it and establish it here.

Supermind is the grade of existence beyond mind, life and Matter and, as mind, life and Matter have manifested on the earth, so too must Supermind in the inevitable course of things manifest in this world of Matter. In fact, a supermind is already here but it is involved, concealed behind this manifest mind, life and Matter and not yet acting overtly or in its own power: if it acts, it is through these inferior powers and modified by their characters and so not yet recognisable. It is only by the approach and arrival of the descending Supermind that it can be liberated upon earth and reveal itself in the action of our material, vital and mental parts so that these lower powers can become portions of a total divinised activity of our whole being: it is that that will bring to us a completely realised divinity or the divine life. It is indeed so that life and mind involved in Matter have realised themselves here; for only what is involved can evolve, otherwise there could be no emergence.

The manifestation of a supramental truth-consciousness is therefore the capital reality that will make the divine life possible. It is when all the movements of thought, impulse and action are governed and directed by a self-existent and luminously automatic truth-consciousness and our whole nature comes to be constituted by it and made of its stuff that the life divine will be complete and absolute. Even as it is, in reality though not in the appearance of things, it is a secret self-existent knowledge and truth that is working to manifest itself in the creation here. The Divine is already there immanent within us, ourselves are that in our inmost reality and it is this reality that we have to manifest; it is that which constitutes the urge towards the divine living and makes necessary the creation of the life divine even in this material existence.
A manifestation of the Supermind and its truth-consciousness is then inevitable; it must happen in this world sooner or later. But it has two aspects, a descent from above, an ascent from below, a self-revelation of the Spirit, an evolution in Nature. The ascent is necessarily an effort, a working of Nature, an urge or nisus on her side to raise her lower parts by an evolutionary or revolutionary change, conversion or transformation into the divine reality and it may happen by a process and progress or by a rapid miracle. The descent or self-revelation of the Spirit is an act of the supreme Reality from above which makes the realisation possible and it can appear either as the divine aid which brings about the fulfilment of the progress and process or as the sanction of the miracle. Evolution, as we see it in this world, is a slow and difficult process and, indeed, needs usually ages to reach abiding results; but this is because it is in its nature an emergence from inconscient beginnings, a start from nescience and a working in the ignorance of natural beings by what seems to be an unconscious force. There can be, on the contrary, an evolution in the light and no longer in the darkness, in which the evolving being is a conscious participant and cooperator, and this is precisely what must take place here. Even in the effort and progress from the Ignorance to Knowledge this must be in part if not wholly the endeavour to be made on the heights of the nature, and it must be wholly that in the final movement towards the spiritual change, realisation, transformation. It must be still more so when there is a transition across the dividing line between the Ignorance and the Knowledge and the evolution is from knowledge to greater knowledge, from consciousness to greater consciousness, from being to greater being. There is then no longer any necessity for the slow pace of the ordinary evolution; there can be rapid conversion, quick transformation after transformation, what would seem to our normal present mind a succession of miracles. An evolution on the supramental levels could well be of that nature; it could be equally, if the being so chose, a more leisurely passage of one supramental state or condition of things to something beyond but still supramental, from level to divine level, a building up of
divine gradations, a free growth to the supreme Supermind or beyond it to yet undreamed levels of being, consciousness and Ananda.

The supramental knowledge, the truth-consciousness of the Supermind is in itself one and total: even when there is a voluntary limitation of the knowledge or what might seem to be a partial manifestation, it is so voluntarily; the limitation does not proceed from or result in any kind of ignorance, it is not a denial or withholding of knowledge, for all the rest of the truth that is not brought into expression is implicit there. Above all, there are no contradictions: whatever would seem to be opposites to the mind, here carry in themselves their own right relation and reconciling agreement,—if indeed any reconciliation were needed, for the harmony of these apparent opposites is complete. The mind tends to put the personal and the impersonal in face of each other as if they were two contraries, but the Supermind sees and realises them as, at the lowest, complements and mutually fulfilling powers of the single Reality and, more characteristically, as interfused and inseparable and themselves that single Reality. The Person has his aspect of impersonality inseparable from himself without which he could not be what he is or could not be his whole self: the Impersonal is in its truth not a state of existence, a state of consciousness and a state of bliss, but a Being self-existent, conscious of self, full of his own self-existent bliss, bliss the very substance of his being,—so, the one single and illimitable Person, Purusha. In the Supermind the finite does not cut up or limit the infinite, does not feel itself contrary to the infinite; but rather it feels its own infinity: the relative and temporal is not a contradiction of eternity but a right relation of its aspects, a native working or an imperishable feature of the eternal. Time there is only the eternal in extension and the eternal can be felt in the momentary. Thus the integral Divine is there in the Supermind and no theory of illusion or self-contradictory Maya need be thrust in to justify its way of existence. It will be obvious that an escape from life is not necessary for the Divine to find itself or its reality; it possesses that always whether in cosmic life or in its transcendent existence. The divine life cannot
be a contradiction of the Divine or of the supreme reality; it is part of that reality, an aspect or expression of it and it can be nothing else. In life on the supramental plane all the Divine is possessed, and when the Supermind descends on earth, it must bring the Divine with it and make that full possession possible here.

The divine life will give to those who enter into it and possess it an increasing and finally a complete possession of the truth-consciousness and all that it carries in it; it will bring with it the realisation of the Divine in self and the Divine in Nature. All that is sought by the God-seeker will be fulfilled in his spirit and in his life as he moves towards spiritual perfection. He will become aware of the transcendent reality, possess in the self-experience the supreme existence, consciousness, bliss, be one with Sachchidananda. He will become one with cosmic being and universal Nature: he will contain the world in himself, in his own cosmic consciousness and feel himself one with all beings; he will see himself in all and all in himself, become united and identified with the Self which has become all existences. He will perceive the beauty of the All-Beautiful and the miracle of the All-Wonderful; he will enter in the end into the bliss of the Brahman and live abidingly in it and for all this he will not need to shun existence or plunge into the annihilation of the spiritual Person in some self-extinguishing Nirvana. As in the Self, so in Nature, he can realise the Divine. The nature of the Divine is Light and Power and Bliss; he can feel the divine Light and Power and Bliss above him and descending into him, filling every strand of his nature, every cell and atom of his being, flooding his soul and mind and life and body, surrounding him like an illimitable sea and filling the world, suffusing all his feeling and sense and experience, making all his life truly and utterly divine. This and all else that the spiritual consciousness can bring to him the divine life will give him when it reaches its utmost completeness and perfection and the supramental truth-consciousness is fulfilled in all himself; but even before that he can attain to something of it all, grow in it, live in it, once the Supermind has descended upon him and has the direction of his
existence. All relations with the Divine will be his: the trinity of God-knowledge, divine works and devotion to God will open within him and move towards an utter self-giving and surrender of his whole being and nature. He will live in God and with God, possess God, as it is said, even plunge in him forgetting all separate personality, but not losing it in self-extinction. The love of God and all the sweetness of love will remain his, the bliss of contact as well as the bliss of oneness and the bliss of difference in oneness. All the infinite ranges of experience of the Infinite will be his and all the joy of the finite in the embrace of the Infinite.

The descent of the Supermind will bring to one who receives it and is fulfilled in the truth-consciousness all the possibilities of the divine life. It will take up not only the whole characteristic experience which we recognise already as constituting the spiritual life, but also all which we now exclude from that category but which is capable of divinisation, not excluding whatever of the earth-nature and the earth-life can be transformed by the touch of the Supermind and taken up into the manifested life of the Spirit. For a divine life on earth need not be a thing apart and exclusive having nothing to do with the common earthly existence: it will take up human being and human life, transform what can be transformed, spiritualise whatever can be spiritualised, cast its influence on the rest and effectuate either a radical or an uplifting change, bring about a deeper communion between the universal and the individual, invade the ideal with the spiritual truth of which it is a luminous shadow and help to uplift into or towards a greater and higher existence. Mind it will uplift towards a diviner light of thought and will, life towards deeper and truer emotion and action, towards a larger power of itself, towards high aims and motives. Whatever cannot yet be raised into its own full truth of being, it will bring nearer to that fullness; whatever is not ready even for that change, will still see the possibility open to it whenever its still incomplete evolution has made it ready for self-fulfilment. Even the body, if it can bear the touch of Supermind, will become more aware of its own truth, — for there is a body consciousness
that has its own instinctive truth and power of right condition and action, even a kind of unexpressed occult knowledge in the constitution of its cells and tissues which may one day become conscious and contribute to the transformation of the physical being. An awakening must come in the earth-nature and in the earth-consciousness which will be, if not the actual beginning, at least the effective preparation and the first steps of its evolution towards a new and diviner world order.

This would be the fulfilment of the divine life which the descent of Supermind and the working of the truth-consciousness taking hold of the whole nature of the living being would bring about in all who could open themselves to its power or influence. Even its first immediate effect would be on all who are capable the possibility of entering into the truth-consciousness and changing all the movements of the nature more and more into the movements of the supramental truth, truth of thought, truth of will, truth in the feelings, truth in the acts, true conditions of the whole being even to the body, eventually transformation, a divinising change. For those who could so open themselves and remain open, there would be no limitation to this development and even no fundamental difficulty; for all difficulties would be dissolved by the pressure of the supramental light and power from above pouring itself into the mind and the life-force and the body. But the result of the supramental descent need not be limited to those who could thus open themselves entirely and it need not be limited to the supramental change; there could also be a minor or secondary transformation of the mental being within a freed and perfected scope of the mental nature. In place of the human mind as it now is, a mind limited, imperfect, open at every moment to all kinds of deviation from the truth or missing of the truth, all kinds of error and openness even to the persuasions of a complete falsehood and perversion of the nature, a mind blinded and pulled down towards inconscience and ignorance, hardly arriving at knowledge, an intellect prone to interpret the higher knowledge in abstractions and indirect figures seizing and holding even the messages of the higher intuition with an uncertain and disputed grasp, there could emerge
a true mind liberated and capable of the free and utmost perfection of itself and its instruments, a life governed by the free and illumined mind, a body responsive to the light and able to carry out all that the free mind and will could demand of it. This change might happen not only in the few, but extend and generalise itself in the race. This possibility, if fulfilled, would mean that the human dream of perfection, perfection of itself, of its purified and enlightened nature, of all its ways of action and living, would be no longer a dream but a truth that could be made real and humanity lifted out of the hold on it of inconscience and ignorance. The life of the mental being could be harmonised with the life of the Supermind which will then be the highest order above it, and become even an extension and annexe of the truth-consciousness, a part and province of the divine life. It is obvious that if the Supermind is there and an order of supramental being is established as the leading principle in earth-nature, as mind is now the leading principle, but with a sureness, a complete government of the earthly existence, a capacity of transformation of all upon their level and within their natural boundaries of which the mind in its imperfection was not capable, an immense change of human life, even if it did not extend to transformation, would be inevitable.

It remains to consider what might be the obstacles in the way of this possibility, especially those offered by the nature of the earth-order and its function as a field of a graded evolution in which our humanity is a stage and, it might be argued, its very imperfection an evolutionary necessity, how far could or would Supermind by its presence and government of things overcome this difficulty while respecting the principle of gradation, and whether it could not rectify the wrong and ignorant order imposed by the Ignorance and Inconscience and substitute for it a right gradation in which the perfection and divinisation would be possible. Certainly, the way for the individual would be open; whatever group of human beings aspire as united in an endeavour at a perfect individual and collective living or aspire to the divine life, would be assisted towards the attainment of its aspiration: that at least the Supermind would make its minimum
consequence. But the greater possibility is also there and might even be offered to the whole of humanity. This, then, we have to consider, what would the descent of the Supermind mean for mankind and what would be its result or its promise for the whole life and evolutionary future and destiny of the human race?
Supermind and Humanity

WHAT THEN would be the consequence for humanity of the descent of Supermind into our earthly existence, its consequence for this race born into a world of ignorance and inconscience but capable of an upward evolution of its consciousness and an ascent into the light and power and bliss of a spiritual being and spiritual nature? The descent into the earth-life of so supreme a creative power as the Supermind and its truth-consciousness could not be merely a new feature or factor added to that life or put in its front but without any other importance or only a restricted importance carrying with it no results profoundly affecting the rest of earth-nature. Especially it could not fail to exercise an immense influence on mankind as a whole, even a radical change in the aspect and prospect of its existence here, even if this power had no other capital result on the material world in which it had come down to intervene. One cannot but conclude that the influence, the change made would be far-reaching, even enormous: it would not only establish the Supermind and a supramental race of beings upon the earth, it could bring about an uplifting and transforming change in mind itself and, as an inevitable consequence, in the consciousness of man, the mental being, and would equally bring about a radical and transforming change in the principles and forms of his living, his ways of action and the whole build and tenor of his life. It would certainly open to man the access to the supramental consciousness and the supramental life; for we must suppose that it is by such a transformation that a race of supramental beings would be created, even as the human race itself has arisen by a less radical but still a considerable uplifting and enlargement of consciousness and conversion of the body’s instrumentation and its indwelling and evolving mental and spiritual capacities and powers out of a first animal state. But even without any
such complete transformation, the truth-principle might so far replace the principle we see here of an original ignorance seeking for knowledge and arriving only at a partial knowledge that the human mind could become a power of light, of knowledge finding itself, not the denizen of a half-way twilight or a servant and helper of the ignorance, a purveyor of mingled truth and error. Mind might even become in man, what it is in its fundamental origin, a subordinate, limited and special action of the Supermind, a sufficiently luminous receptacle of truth, and at least all falsity in its works might cease.

It could at once be objected that this would alter the whole evolutionary order and its balance and leave an incurable gap in its completeness: there would be an unbridged gulf between man and the animal and no way for the evolutionary nisus to journey over it in the progress of the consciousness from animality to divinity; for some kind of divinity would be involved in the suggested metamorphosis. It might be contended that the true process of evolution is to add a new principle, degree or stage to the already existing order and not to make any alteration in any previously established feature. Man came into being but the animal remained the animal and made no progress towards a half-humanity: all slight modifications of consciousness, capacities or habits in domestic animals produced by the association with man or by his training of them are only slight alterations of the animal intelligence. Still less can the plant move towards animal consciousness or brute Matter become in the slightest degree, even subconsciously or half subconsciously, aware of itself or responsive or reactive. The fundamental distinctions remain and must remain unaltered in the cosmic order. But this objection presumes that the new humanity must be all of one level; there may well be gradations of consciousness in it which would bridge the distance between its least developed elements and the higher animals who, although they cannot pass into a semi-human kind, might still progress towards a higher animal intelligence: for certain experiments show that these are not all entirely unprogressive. These gradations would serve the purpose of the transition quite as well as the least developed humans.
in the present scale without leaving a gap so wide as to disturb the evolutionary order of the universe. A considerable saltus can, as it is, be observed separating the different orders, Matter and the plant, the plant and the lower animals, one species of animals and another, as well as that always existing and large enough between the highest animal and man. There would therefore be no incurable breach in the evolutionary order, no such distance between human mind and animal mind, between the new type of human being and the old animal level as could not be overleaped or would create an unbridgeable gulf for the most developed animal soul in its passage to the least developed type of the new humanity. A leap, a saltus, there would be, as there is now; but it would not be between animality and divinity, from animal mind to Supermind: it would be between a most highly developed animal mind turning towards human possibilities — for without that the passage from animal to man could not be achieved — and a human mind waking to the possibility, not yet the full achievement, of its own higher yet unattained capacities.

One result of the intervention of Supermind in the earth-nature, the descent of the supreme creative Truth-Power, might well be a change in the law of evolution, its method and its arrangement: a larger element of the principle of evolution through knowledge might enter into the forces of the material universe. This might extend itself from a first beginning in the new creation and produce increasing effects in the order which is now wholly an evolution in the ignorance, and indeed starts from the complete nescience of the Inconscient and proceeds towards what can be regarded even in its highest attainment of knowledge as a lesser ignorance, since it is more a representation than a direct and complete possession of knowledge. If man began to develop the powers and means of a higher knowledge in something like fullness, if the developing animal opened the door of his mentality to beginnings of conscious thought and even a rudimentary reason, — at his highest he is not so irrevocably far from that even now, — if the plant developed its first subconscient reactions and attained to some kind of primary nervous sensitiveness, if Matter, which is a blind form of the Spirit, were
to become more alive with the hidden power within it and to offer more readily the secret sense of things, the occult realities it covers, as for instance, the record of the past it always preserves even in its dumb inconscience or the working of its involved forces and invisible movements revealing veiled powers in material nature to a subtler generalised perception of the new human intelligence, this would be an immense change promising greater changes in the future, but it would mean only an uplifting and not a disturbance of the universal order. Evolution would itself evolve, but it would not be perturbed or founder.

It is difficult for us to conceive in theory or admit as a practical possibility the transformation of the human mentality I have suggested as a change that would naturally take place under the lead of the supramental Truth-consciousness, because our notions about mind are rooted in an experience of human mentality in a world which starts from inconscience and proceeds through a first almost complete nescience and a slowly lessening ignorance towards a high degree but always incomplete scope and imperfect method of only partially equipped knowledge which does not serve fully the needs of a consciousness always pushing towards its own still immeasurably distant absolute. The visible imperfections and limitations of mind in the present stage of its evolution here we take as part of its very nature; but in fact the boundaries in which it is still penned are only temporary limits and measures of its still incomplete evolutionary advance; its defects of methods and means are faults of its immaturity and not proper to the constitution of its being; its achievement, although extraordinary under the hampering conditions of the mental being weighed down by its instrumentation in an earthly body, is far below and not beyond what will be possible to it in its illumined future. For mind is not in its very nature an inventor of errors, a father of lies bound down to a capacity of falsehood, wedded to its own mistakes and the leader of a stumbling life as it too largely is at present owing to our human shortcomings: it is in its origin a principle of light, an instrument put forth from the Supermind and, though set to work within limits and even set to create limits, yet the limits are luminous borders for
a special working, voluntary and purposive bounds, a surface of the finite ever extending itself under the eye of infinity. It is this character of Mind that will reveal itself under the touch of Supermind and make human mentality an adjunct and a minor instrumentation of the supramental knowledge. It will even be possible for the mind no longer limited by the intellect to become capable of a sort of mental gnosis, a luminous reproduction of the Truth in a diminished working, extending the power of the Light not only to its own but to lower levels of consciousness in their climb towards self-transcendence. Overmind, Intuition, Illumined Mind and what I have called Higher Mind, these and other levels of a spiritualised and liberated mentality, will be able to reflect in the uplifted human mind and its purified and exalted feeling and force of life and action something of their powers and prepare the ascent of the soul to their own plateaus and peaks of an ascending existence. This is essentially the change which can be contemplated as a result of the new evolutionary order, and it would mean a considerable extension of the evolutionary field itself and will answer the question as to the result on humanity of the advent of Supermind into the earth-nature.

If mind in its origin from Supermind is itself a power of Supermind, a principle of Light and a power of Light or a force for Knowledge specialised in its action for a subordinate purpose, yet it assumes a different aspect when in the working out of this purpose it separates itself more and more from the supramental light, from the immediate power and supporting illumination of the supramental principle. It is as it departs more and more in this direction from its own highest truth that it becomes a creator or parent of ignorance and is or seems to be the highest power in a world of ignorance; it becomes itself subject to ignorance and seems only to arrive at a partial and imperfect knowledge. The reason of this decline is that it is used by the Supermind principally for the work of differentiation which is necessary if there is to be a creation and a universe. In the Supermind itself, in all its creation there is this differentiating power, the manifestation of the One in the Many and
the Many in the One; but the One is never forgotten or lost in its multiplicity which always consciously depends upon and never takes precedence over the eternal oneness. In the mind, on the contrary, the differentiation, the multiplicity does take precedence and the conscious sense of the universal oneness is lost and the separated unit seems to exist for itself and by itself as a sufficient self-conscious integer or in inanimate objects as the inconscient integer.

It should be noted, however, that a world or plane of mind need not be a reign of ignorance where falsity, error or nescience must have a place; it may be only a voluntary self-limitation of knowledge. It could be a world where all possibilities capable of being determined by mind could manifest themselves in the successions of Time and find a true form and field of their action, the expressive figure of themselves, their capacity of self-development, self-realisation of a kind, self-discovery. This is actually what we meet when we follow in psychic experience the line of descent by which the involution takes place which ends in Matter and the creation of the material universe. What we see here is not the planes or worlds of the descent in which mind and life can keep something of their truth and something of the light of the spirit, something of their true and real being; here we see an original inconscience and a struggle of life and mind and spirit to evolve out of the material inconscience and in a resultant ignorance to find themselves and grow towards their full capacity and highest existence. If mind succeeds in that endeavour there is no reason why it should not recover its true character and be once more a principle and power of Light and even in its own way aid in the workings of a true and complete knowledge. At its highest it might pass out of its limitations into the supramental truth and become part and function of the supramental knowledge or at the least serve for a minor work of differentiation in the consensus of that knowledge: in the lower degree below Supermind it might be a mental gnosis, a spiritual or spiritualised perception, feeling, activity, sense which could do the works of knowledge and not of ignorance. Even at a still lower level it could be an increasingly luminous passage leading
from light to light, from truth to truth and no longer a circling in the mazes of half-truth and half-nescience. This would not be possible in a world where untransformed mind or human mind burdened with its hampering disabilities, as it now is, will still be the leader or the evolution’s highest achievement, but with Supermind for the leading and dominant power this might well happen, and might even be regarded as one result and an almost inevitable result of its descent into the human world and its touch on the mind of humanity.

How far this would go, whether the whole of humanity would be touched or only a part of it ready for the change, would depend on what was intended or possible in the continued order of the universe. If the old evolutionary principle and order must be preserved, then only a section of the race would pass onward, the rest would keep the old human position, level and function in the ascending order. But even so there must be a passage or bridge between the two levels or orders of being by which the evolution would make its transition from one to the other; the mind would there be capable of contact with and modification by the supramental truth and thus would be the means of the soul’s passing on upward: there must be a status of mind capable of receiving and growing in the Light towards Supermind though not reaching it; through that, as even now happens in a lesser degree through a dimmer medium, the lustre of a greater truth would send down its rays for the liberation and uplift of the soul in the ignorance. Supermind is here veiled behind a curtain and, though not organised for its own characteristic action, it is the true cause of all creation here, the power for the growth of truth and knowledge and the ascension of the soul towards the hidden Reality. But in a world where Supermind has made its appearance, it could hardly be a separate factor isolated from the rest, it would inevitably not only create superman but change and uplift man. A total change of the mental principle, such as has been suggested, cannot be ruled out as impossible.

Mind as we know it, as a power of consciousness quite distinct from Supermind, no longer a power devolved from it, connected with it and dependent upon it, but practically
divorced from its luminous origin, is marked by several characteristics which we conceive to be the very signs of its nature: but some of these belong to Supermind also and the difference is in the way and scope of their action, not in their stuff or in their principle. The difference is that mind is not a power of whole knowledge and only when it begins to pass beyond itself a power of direct knowledge: it receives rays of the truth but does not live in the sun; it sees as through glasses and its knowledge is coloured by its instruments, it cannot see with the naked eye or look straight at the sun. It is not possible for mind to take its stand in the solar centre or anywhere in the radiant body or even on the shining circumference of the orb of perfect truth and acquire or share in its privilege of infallible or absolute knowledge. It would be only if it had already drawn near to the light of Supermind that it could live anywhere near this sun in the full splendour of its rays, in something of the full and direct blaze of Truth, and the human mind even at its highest is far from that; it can only live at most in a limited circle, in some narrow beginnings of a pure insight, a direct vision and it would take long for it, even in surpassing itself, to reach to an imitative and fragmentary reflection of a dream of the limited omniscience and omnipotence which is the privilege of a delegated divinity, of the god, of a demiurge. It is a power for creation, but either tentative and uncertain and succeeding by good chance or the favour of circumstance or else, if assured by some force of practical ability or genius, subject to flaw or pent within unescapable limits. Its highest knowledge is often abstract, lacking in a concrete grasp; it has to use expedients and unsure means of arrival, to rely upon reasoning, argumentation and debate, inferences, divinations, set methods of inductive or deductive logic, succeeding only if it is given correct and complete data and even then liable to reach on the same data different results and varying consequences; it has to use means and accept results of a method which is hazardous even when making a claim to certitude and of which there would be no need if it had a direct or a supra-intellectual knowledge. It is not necessary to push the description further; all this is the very nature of our terrestrial ignorance and its shadow
hangs on even to the thought and vision of the sage and the seer and can be escaped only if the principle of a truth-conscious supramental knowledge descends and takes up the governance of the earth-nature.

It should be noted, however, that even at the bottom of the involutionary descent, in the blind eclipse of consciousness in Matter, in the very field of the working of the Inconscient there are signs of the labour of an infallible force, the drive of a secret consciousness and its promptings, as if the Inconscient itself were secretly informed or impelled by a Power with a direct and absolute knowledge; its acts of creation are infinitely surer than the workings of our human consciousness at its best or the normal workings of the Life-power. Matter, or rather the Energy in Matter seems to have a more certain knowledge, a more infallible operation of its own and its mechanism once set going can be trusted for the most part to do its work accurately and well. It is so that man is able, taking hold of a material energy, to mechanise it for his own ends and trust it under proper conditions to do for him his work. The self-creating life-power, amazingly abundant in its invention and fantasy, yet seems to be more capable of flaw, aberration and failure; it is as if its greater consciousness carried in it a greater capacity for error. Yet it is sure enough ordinarily in its workings: but as consciousness increases in the forms and operations of life, and most when mind enters in, disturbances also increase as if the increase of consciousness brought with it not only richer possibilities but more possibilities of stumbling, error, flaw and failure. In mind, in man, we seem to reach the height of this antinomy, the greatest, highest, widest reach and achievements of consciousness, the greatest amount of uncertainty, defect, failure and error. This, we may conjecture, may be because in inconscient Nature there is a truth of energy at work which follows infallibly its own law, an energy which can walk blindfold without stumbling because the automatic law of the truth is within it, operating surely without swerving or mistake when there is no external intervention or interference. But in all normally automatic processes of existence there is this law: even the body has an unexpressed knowledge of
its own, a just instinct in its action within certain limits and this when not interfered with by life’s desires and mind’s errors can work with a certain accuracy and sureness. But Supermind alone has the truth-consciousness in full and, if this comes down and intervenes, mind, life and body too can attain to the full power of the truth in them and their full possibility of perfection. This, no doubt, would not take place at once, but an evolutionary progress towards it could begin and grow with increasing rapidity towards its fullness. All men might not reach that fullness till a later time, but still the human mind could come to stand perfected in the Light and a new humanity take its place as part of the new order.

This is the possibility we have to examine. If it is destined to fulfil itself, if man is not doomed to remain always as a vassal of the Ignorance, the disabilities of the human mind on which we have dwelt are not such as must remain irredeemably in possession and binding for ever. It could develop higher means and instrumentalities, pass over the last borders of the Ignorance into a higher knowledge, grow too strong to be held back by the animal nature. There would be a liberated mind escaping from ignorance into light, aware of its affiliation to Supermind, a natural agent of Supermind and capable of bringing down the supramental influence into the lower reaches of being, a creator in the light, a discoverer in the depths, an illuminant in the darkness, helping perhaps to penetrate even the Inconscient with the rays of a secret Superconscience. There would be a new mental being not only capable of standing enlightened in the radiance of the Supermind but able to climb consciously towards it and into it, training life and body to reflect and hold something of the supramental light, power and bliss, aspiring to release the secret divinity into self-finding and self-fulfilment and self-poise, aspiring towards the ascension to the divine consciousness, able to receive and bear the descent of the divine light and power, fitting itself to be a vessel of the divine Life.
A NEW humanity would then be a race of mental beings on the earth and in the earthly body, but delivered from its present conditions in the reign of the cosmic Ignorance so far as to be possessed of a perfected mind, a mind of light which could even be a subordinate action of the supermind or Truth-consciousness, and in any case capable of the full possibilities of mind acting as a recipient of that truth and at least a secondary action of it in thought and life. It could even be a part of what could be described as a divine life upon earth and at least the beginnings of an evolution in the Knowledge and no longer entirely or predominantly in the Ignorance. How far this would go, whether it would eventually embrace the whole of humanity or only an advanced portion of it, would depend upon the intention in the evolution itself, on the intention in whatever cosmic or transcendent Will is guiding the movements of the universe. We have supposed not only the descent of the supermind upon the earth but its embodiment in a supramental race with all its natural consequences and a new total action in which the new humanity would find its complete development and its assured place in the new order.

But it is clear that all this could only come as a result of the evolution which is already taking place upon earth extending far beyond its present bounds and passing into a radically new movement governed by a new principle in which mind and man would be subordinate elements and no longer mind the utmost achievement or man the head or leader. The evolution we see around us at present is not of that kind and, it might be said, shows few signs of such a possibility, so few that the reason, at present our only sure guide, has no right to hazard belief in it. Earth, the earth we see, with its life deeply immersed and founded in inconscience and ignorance, is not built for such a
development or capable of holding such an advent; its materiality and limitations condemn it to be permanently the field of a far inferior order. It may be said too that for such an order there must be a place somewhere and even if supermind is not a mere unwarranted speculation and is a concrete reality, there is no need and no place for its embodying itself here. Mind, as marking the full play of the knowledge possible to the ignorance, must have its field somewhere and to keep the earth as its natural field would best serve the economy of cosmic Nature. A materialistic philosophy would admit of no possibility of a divine life in Matter; but even a philosophy admitting a soul or spirit or a spiritual terminus of the evolutionary movement here could very well deny the capacity of earth for a divine life: a divine existence could only be achieved by a departure from earth and the body. Even if cosmic existence is not an illusion or Maya, a divine or a completely spiritual being is likely to be possible only in another less material world or only in the pure spirit. At any rate, to the normal human reason the odds seem to be heavily against any early materialisation on earth of anything divine.

Again, if too strong a stress is laid on the present or apparent character of the evolution here as it is presented to us by physical science, it might be urged that there is no warrant for expecting any emergence of a principle higher than human mind or of any such thing as superhuman beings in a world of Matter. Consciousness is itself dependent upon Matter and material agencies for its birth and its operations and an infallible Truth-consciousness, such as we suppose supermind to be, would be a contradiction of these conditions and must be dismissed as a chimera. Fundamentally, physical science regards evolution as a development of forms and vital activities; the development of a larger and more capable consciousness is a subordinate result of the development of life and form and not a major or essential characteristic or circumstance and it cannot go beyond limits determined by the material origin of mind and life. Mind has shown itself capable of many extraordinary achievements, but independence of the material organ or of physical conditions or
a capability for any such thing as a power of direct and absolute knowledge not acquired by material means would be beyond the conditions imposed by Nature. At a certain point therefore the evolution of consciousness can go no further. Even if a something definite and independent which we call a soul exists, it is limited by its natural conditions here where Matter is the basis, physical life the condition, mind the highest possible instrument; there is no possibility of an action of consciousness apart from the body or surpassing this physical, vital or mental Nature. This fixes the limits of our evolution here.

It might be suggested also that until something clearly recognisable like supermind manifests itself with some definiteness and fullness or until it descends and takes possession of our earth-consciousness, we cannot be certain that it exists; till then mind holds the place as a general arbiter or field of reference for all knowledge and mind is incapable of any certain or absolute knowledge; it has to doubt all, to test all and yet to achieve all, but cannot be secure in its knowledge or its achievement. That, incidentally, establishes the necessity of such a principle as the supermind or Truth-consciousness in any intelligible universe, for without it there is no issue, no goal for either life or knowledge. Consciousness cannot achieve its own entire meaning, its own supreme result without it; it will end in an inconsequence or a fiasco. To become aware of its own truth and all truth is the very aim of its existence and it cannot do so, so long as it has to tend towards truth, towards knowledge in ignorance and through the ignorance: it must develop or it must reach a power of itself whose very nature is to know, to see, to possess in its own power. This is what we call supermind and, once it is admitted, all the rest becomes intelligible. But till then we are in doubt and it may be contended that even if supermind is admitted as a reality, there can be no certainty of its advent and reign: till then all effort towards it may end in failure. It is not enough that the supermind should be actually there above us, its descent a possibility or a future intention in Nature. We have no certainty of the reality of this descent until it becomes an objectivised fact in our earthly being. Light has often tried
to descend upon the earth, but the Light remains unfulfilled and incomplete; man may reject the Light, the world is still full of darkness and the advent seems to be little more than a chance; this doubt is to some extent justified by the actualities of the past and still existing possibilities of the future. Its power to stand would disappear only if supermind is once admitted as a consequent part of the order of the universe. If the evolution tends from Matter to Supermind, it must also tend to bring down Supermind into Matter and the consequences are inevitable.

The whole trouble of this incertitude arises from the fact that we do not look straight at the whole truth of the world as it is and draw from it the right conclusion as to what the world must be and cannot fail to be. This world is, no doubt, based ostensibly upon Matter, but its summit is Spirit and the ascent towards Spirit must be the aim and justification of its existence and the pointer to its meaning and purpose. But the natural conclusion to be drawn from the supremacy and summit existence of Spirit is clouded by a false or imperfect idea of spirituality which has been constructed by intellect in its ignorance and even by its too hasty and one-sided grasp at knowledge. The Spirit has been thought of not as something all-pervading and the secret essence of our being, but as something only looking down on us from the heights and drawing us only towards the heights and away from the rest of existence. So we get the idea of our cosmic and individual being as a great illusion, and departure from it and extinction in our consciousness of both individual and cosmos as the only hope, the sole release. Or we build up the idea of the earth as a world of ignorance, suffering and trial and our only future an escape into heavens beyond; there is no divine prospect for us here, no fulfilment possible even with the utmost evolution on earth in the body, no victorious transformation, no supreme object to be worked out in terrestrial existence. But if supermind exists, if it descends, if it becomes the ruling principle, all that seems impossible to mind becomes not only possible but inevitable. If we look closely, we shall see that there is a straining of mind and life on their heights towards their own perfection, towards
some divine fulfilment, towards their own absolute. That and not only something beyond and elsewhere is the true sign, the meaning of this constant evolution and the labour of continual birth and rebirth and the spiral ascent of Nature. But it is only by the descent of supermind and the fulfilment of mind and life by their self-exceeding that this secret intention in things, this hidden meaning of Spirit and Nature can become utterly overt and in its totality realisable. This is the evolutionary aspect and significance of supermind, but in truth it is an eternal principle existing covertly even in the material universe, the secret supporter of all creation, it is that which makes the emergence of consciousness possible and certain in an apparently inconscient world and compels a climb in Nature towards a supreme spiritual Reality. It is, in fact, an already and always existent plane of being, the nexus of Spirit and Matter, holding in its truth and reality and making certain the whole meaning and aim of the universe.

If we disregard our present ideas of evolution, all changes, — if we can regard consciousness and not life and form as the fundamental and essential evolutionary principle and its emergence and full development of its possibilities as the object of the evolutionary urge. The inconscience of Matter cannot be an insuperable obstacle; for in this inconscience can be detected an involved consciousness which has to evolve; life and mind are steps and instruments of that evolution; the purposeful drive and workings of the inconscient material Energy are precisely such as we can attribute to the presence of an involved consciousness, automatic, not using thought like the mind but guided by something like an inherent material instinct practically infallible in all its steps, not yet cognitive but miraculously creative. The entirely and inherently enlightened Truth-consciousness we attribute to supermind would be the same reality appearing at an ultimate stage of the evolution, finally evolved and no longer wholly involved as in Matter or partly and imperfectly evolved and therefore capable of imperfection and error as in life and mind, now possessed of its own natural fullness and perfection, luminously automatic, infallible. All the objections to a complete
evolutionary possibility then fall away; it would, on the contrary, be the inevitable consequence contained not only in Nature as a whole but even in material Nature.

In this vision of things the universe will reveal itself in its unity and totality as a manifestation of a single Being, Nature as its power of manifestation, evolution as its process of gradual self-revelation here in Matter. We would see the divine series of the worlds as a ladder of ascent from Matter to supreme Spirit; there would reveal itself the possibility, the prospect of a supreme manifestation by the conscious and no longer a veiled and enigmatic descent of the Spirit and its powers in their fullness even into this lowest world of Matter. The riddle of the universe need be no longer a riddle; the dubious mystery of things would put off its enigma, its constant ambiguity, the tangled writings would become legible and intelligible. In this revelation, supermind would take its natural place and no longer be a matter of doubt or questioning to an intelligence bewildered by the complexity of the world; it would appear as the inevitable consequence of the nature of mind, life and Matter, the fulfilment of their meaning, their inherent principle and tendencies, the necessary perfection of their imperfection, the summit to which all are climbing, the consummation of divine existence, consciousness and bliss to which it is leading, the last result of the birth of things and supreme goal of this progressive manifestation which we see here in life.

The full emergence of supermind may be accomplished by a sovereign manifestation, a descent into earth-consciousness and a rapid assumption of its powers and disclosing of its forms and the creation of a supramental race and a supramental life: this must indeed be the full result of its action in Nature. But this has not been the habit of evolutionary Nature in the past upon earth and it may well be that this supramental evolution also will fix its own periods, though it cannot be at all a similar development to that of which earth has hitherto been the witness. But once it has begun, all must unavoidably and perfectly manifest and all parts of Nature must tend towards a greatest possible luminousness and perfection. It is this certainty that authorises us to believe
that mind and humanity also will tend towards a realisation that will be far beyond our present dreams of perfection. A mind of light will replace the present confusion and trouble of this earthly ignorance; it is likely that even those parts of humanity which cannot reach it will yet be aware of its possibility and consciously tend towards it; not only so, but the life of humanity will be enlightened, uplifted, governed, harmonised by this luminous principle and even the body become something much less powerless, obscure and animal in its propensities and capable instead of a new and harmonised perfection. It is this possibility that we have to look at and that would mean a new humanity uplifted into Light, capable of a spiritualised being and action, open to governance by some light of the Truth-consciousness, capable even on the mental level and in its own order of something that might be called the beginning of a divinised life.
Mind of Light

A NEW humanity means for us the appearance, the development of a type or race of mental beings whose principle of mentality would be no longer a mind in the Ignorance seeking for knowledge but even in its knowledge bound to the Ignorance, a seeker after Light but not its natural possessor, open to the Light but not an inhabitant of the Light, not yet a perfected instrument, truth-conscious and delivered out of the Ignorance. Instead, it would be possessed already of what could be called a mind of Light, a mind capable of living in the truth, capable of being truth-conscious and manifesting in its life a direct in place of an indirect knowledge. Its mentality would be an instrument of the Light and no longer of the Ignorance. At its highest it would be capable of passing into the supermind and from the new race would be recruited the race of supramental beings who would appear as the leaders of the evolution in earth-nature. Even, the highest manifestations of a mind of Light would be an instrumentality of the supermind, a part of it or a projection from it, a stepping beyond humanity into the superhumanity of the supramental principle. Above all, its possession would enable the human being to rise beyond the normalities of his present thinking, feeling and being into those highest powers of the mind in its self-exceedings which intervene between our mentality and supermind and can be regarded as steps leading towards the greater and more luminous principle. This advance like others in the evolution might not be reached and would naturally not be reached at one bound, but from the very beginning it would be inevitable: the pressure of the supermind creating from above out of itself the mind of Light would compel this certainty of the eventual outcome. The first gleamings of the new Light would carry in themselves the seed of its highest flamings; even in the first beginnings, the certainty
of their topmost powers would be there; for this is the constant story of each evolutionary emergence: the principle of its highest perfection lies concealed in the involution which precedes and necessitates the evolution of the secret principle.

For throughout the story of evolution there are two complementary aspects which constitute its action and are necessary to its totality; there is hidden in the involution of Nature the secret power and principle of being which lies concealed under the veil cast on it by material Nature and there is carried in that Nature itself the inevitable force of the principle compelling the process of emergence of its inherent powers and characters, the essential features which constitute its reality. As the evolutionary principle emerges, there are also two constant features of the process of the emergence: there are the gradations by which it climbs out of the involution and manifests more and more of its power, its possibilities, the force of the Godhead within it, and there is a constant manifestation of all types and forms of its being which are the visible, indicative and efficient embodiments of its essential nature. There appear in the evolutionary process organised forms and activities of Matter, the types of life and the living beings, the types of mind and the thinking beings, the luminosities and greatnesses of the spiritual principle and the spiritual beings whose nature, character, personality, mark the stages of the ascent towards the highest heights of the evolution and the ultimate largest manifestation of what it is in itself and must become by the force of time and the all-revealing Spirit. This is the real sense and drive of what we see as evolution: the multiplication and variation of forms is only the means of its process. Each gradation contains the possibility and the certainty of the grades beyond it: the emergence of more and more developed forms and powers points to more perfected forms and greater powers beyond them, and each emergence of consciousness and the conscious beings proper to it enables the rise to a greater consciousness beyond and the greater order of beings up to the ultimate godheads of which Nature is striving and is destined to show herself capable. Matter developed its organised forms until it became capable of embodying living
organisms; then life rose from the subconscience of the plant into conscious animal formations and through them to the thinking life of man. Mind founded in life developed intellect, developed its types of knowledge and ignorance, truth and error till it reached the spiritual perception and illumination and now can see as in a glass dimly the possibility of supermind and a truth-conscious existence. In this inevitable ascent the mind of Light is a gradation, an inevitable stage. As an evolving principle it will mark a stage in the human ascent and evolve a new type of human being; this development must carry in it an ascending gradation of its own powers and types of an ascending humanity which will embody more and more the turn towards spirituality, capacity for Light, a climb towards a divinised manhood and the divine life.

In the birth of the mind of Light and its ascension into its own recognisable self and its true status and right province there must be, in the very nature of things as they are and very nature of the evolutionary process as it is at present, two stages. In the first, we can see the mind of Light gathering itself out of the Ignorance, assembling its constituent elements, building up its shapes and types, however imperfect at first, and pushing them towards perfection till it can cross the border of the Ignorance and appear in the Light, in its own Light. In the second stage we can see it developing itself in that greater natural light, taking its higher shapes and forms till it joins the supermind and lives as its subordinate portion or its delegate. In each of these stages it will define its own grades and manifest the order of its beings who will embody it and give to it a realised life. Thus there will be built up, first, even in the Ignorance itself, the possibility of a human ascent towards a divine living; then there will be, by the illumination of this mind of Light in the greater realisation of what may be called a gnostic mentality, in a transformation of the human being, even before the supermind is reached, even in the earth-consciousness and in a humanity transformed, an illumined divine life.
Supermind and Mind of Light

The essential character of Supermind is a Truth-consciousness which knows by its own inherent right of nature, by its own light: it has not to arrive at knowledge but possesses it. It may indeed, especially in its evolutionary action, keep knowledge behind its apparent consciousness and bring it forward as if from behind the veil; but even then this veil is only an appearance and does not really exist: the knowledge was always there, the consciousness its possessor and present revealer. This too is only in the evolutionary play and on the supramental plane itself the consciousness lives always in an immediacy of knowledge and acts by a direct immediacy of knowledge. In Mind as we see it here the action is very different; it starts from an apparent absence of knowledge, a seeming ignorance or nescience, even, in material Nature, from an inconscience in which any kind of knowing does not seem at all to exist. It reaches knowledge or the action of knowledge by steps which are not at all immediate but rather knowledge at first seems utterly impossible and foreign to the very substance of this Matter. Yet, in the blindness of Matter itself there are signs of a concealed consciousness which in its hidden fundamental being sees and has the power to act according to its vision and even by an infallible immediacy which is inherent in its nature. This is the same Truth that is apparent in Supermind but is here involved and seems not to be. The Mind of Light is a subordinate action of Supermind, dependent upon it even when not apparently springing direct from it, in which the secret of this connection becomes evident and palpable.

The Truth-consciousness is not only a power of knowledge; it is a being of consciousness and knowledge, a luminous many-sided dynamis and play of the omniscient Spirit; in it there can be a spiritual feeling, a spiritual sensation, a spiritual essentiality of.
substance that knows and reveals, that acts and manifests in an omniscience which is one with omnipotence. In Mind this Truth-consciousness and these workings of the Truth-consciousness can be there and even though it limits itself in Mind and has a subordinate or an indirect working, its action can be essentially the same. There can even be a hidden immediacy which hints at the presence of something absolute and is evidence of the same omnipotence and omniscience. In the Mind of Light when it becomes full-orbed this character of the Truth reveals itself, though in a garb that is transparent even when it seems to cover: for this too is a truth-consciousness and a self-power of knowledge. This too proceeds from the Supermind and depends upon it even though it is limited and subordinate. What we have called specifically the Mind of Light is indeed the last of a series of descending planes of consciousness in which the Supermind veils itself by a self-chosen limitation or modification of its self-manifesting activities, but its essential character remains the same: there is in it an action of light, of truth, of knowledge in which inconscience, ignorance and error claim no place. It proceeds from knowledge to knowledge; we have not yet crossed over the borders of the truth-conscious into ignorance. The methods also are those of a self-luminous knowing and seeing and feeling and a self-fulfilling action within its own borders; there is no need to seek for something missing, no fumbling, no hesitation: all is still a gnostic action of a gnostic power and principle. There has been a descent from full Supermind into Mind, but this Mind though a self-limited is not yet an agnostic consciousness unsure of itself or unsure of its workings; there is still a comprehending or an apprehending consciousness which goes straight to its object and does not miss its mark or have to hunt for it in the dark or in insufficient light: it sees, knows, puts its hand immediately on things of self and things of Nature. We have passed into Mind but Mind has still not broken its inherent connection with the supramental principle.

Still there is an increasing self-limitation which begins even with Overmind: Overmind is separated by only a luminous border from the full light and power of the supramental Truth and
The Supramental Manifestation upon Earth

it still commands direct access to all that Supermind can give it. There is a further limitation or change of characteristic action at each step downwards from Overmind to Intuition, from Intuition to Illumined Mind, from Illumined Mind to what I have called the Higher Mind: the Mind of Light is a transitional passage by which we can pass from supermind and superhumanity to an illumined humanity. For the new humanity will be capable of at least a partly divinised way of seeing and living because it will live in the light and in knowledge and not in the obscuration of the Ignorance.

Still, again there will be a difference between the superhuman and the human, a difference in nature and power but a difference especially in the access and way of admission to the Truth-consciousness and its activities: there may indeed be two orders of its truth, direct and half-direct, immediate and near or even only a reception at a distance. But this we must consider afterwards; at present it is sufficient to mark certain differences in the descending order of gnostic mind which culminates here. We may say that there is a higher hemisphere of our being in which Mind, luminous and aware of its workings, still lives in the Light and can be seen as a subordinate power of the Supermind; it is still an agent of the Truth-consciousness, a gnostic power that has not descended into the mental ignorance; it is capable of a mental gnosis that preserves its connection with the superior light and acts by its power. This is the character of Overmind in its own plane and of all the powers that are dependent on the Overmind: the Supermind works there but at one remove as if in something that it has put forth from itself but which is no longer entirely itself but is still a delegate of the Truth and invested with its authority. We are moving towards a transitional border beyond which lies the possibility of the Ignorance, but the Ignorance is not yet here. In the order of the evolutionary descent we stand in the Mind of Light on that border and a step downward can carry us beyond it into the beginnings of an ignorance which still bears on its face something of the luminosity that it is leaving behind it. On the other hand, in the ascending order of the evolution we reach a transition in which we see the
light, are turned towards it, reflect it in our consciousness and one further step carries us into the domain of the Light. The Truth becomes visible and audible to us and we are in immediate communication with its messages and illuminations and can grow into it and be made one with its substance. Thus there is a succession of ranges of consciousness which we can speak of as Mind but which belongs practically to the higher hemisphere, although in their ontological station they are within the domain of the lower hemisphere. For the whole of being is a connected totality and there is in it no abrupt passage from the principle of Truth and Light into their opposite. The creative truth of things works and can work infallibly even in the Inconscient: the Spirit is there in Matter and it has made a series of steps by which it can travel from it to its own heights in an uninterrupted line of gradations; the depths are linked to the heights and the Law of the one Truth creates and works everywhere.

Even in the material world which seems to us a world of ignorance, a world of the workings of a blind and inconscient Force starting from inconscience and proceeding through ignorance and reaching with difficulty towards an imperfect Light and Knowledge, there is still a secret Truth in things which arranges all, guides towards the Self many contrary powers of being and rises towards its own heights where it can manifest its own highest truth and fulfil the secret purpose of the universe. Even this material world of existence is built upon a pattern of the truth in things which we call Law of Nature, a truth from which we climb to a greater truth until we emerge in the Light of the Supreme. This world is not really created by a blind force of Nature: even in the Inconscient the presence of the supreme Truth is at work; there is a seeing Power behind it which acts infallibly and the steps of the Ignorance itself are guided even when they seem to stumble; for what we call the Ignorance is a cloaked Knowledge, a Knowledge at work in a body not its own but moving towards its own supreme self-discovery. This Knowledge is the covert Supermind which is the support of the creation and is leading all towards itself and guides behind this multitude of minds and creatures and objects which seem
each to be following its own law of nature; in this vast and apparently confused mass of existence there is a law, a one truth of being, a guiding and fulfilling purpose of the world-existence. The Supermind is veiled here and does not work according to its characteristic law of being and self-knowledge, but without it nothing could reach its aim. A world governed by an ignorant mind would soon drift into a chaos; it could not in fact come into existence or remain in existence unless supported by the secret Omniscience of which it is the cover; a world governed by a blind inconscient force might repeat constantly the same mechanical workings but it would mean nothing and arrive nowhere. This could not be the cause of an evolution that creates life out of Matter, out of life mind, and a gradation of planes of Matter, Life and Mind culminating in the emergence of Supermind. The secret truth that emerges in Supermind has been there all the time, but now it manifests itself and the truth in things and the meaning of our existence.

It is in this series of the order of existence and as the last word of the lower hemisphere of being, the first word of the higher hemisphere that we have to look at the Mind of Light and see what is its nature and the powers which characterise it and which it uses for its self-manifestation and workings, its connection with Supermind and its consequences and possibilities for the life of a new humanity.
Note on the Texts
Note on the Texts

ESSAYS IN PHILOSOPHY AND YOGA consists of short prose pieces written by Sri Aurobindo after May 1909 and published by him in journals or books or both before his passing in 1950. Most of them are on aspects of philosophy and yoga. Short prose pieces written between 1910 and 1950 but not published during Sri Aurobindo’s lifetime are included in Essays Divine and Human, volume 12 of THE COMPLETE WORKS OF SRI AUROBINDO. Short prose writings published between 1910 and 1950 on certain specialised subjects — the Vedas, the Upanishads, Indian culture, political theory, education, poetics — are included in the volumes of THE COMPLETE WORKS dealing with those subjects.

Essays in Philosophy and Yoga is divided into five parts according to the date of writing and original place of publication of the constituent pieces: Part One, essays from the Karmayogin, 1909–10; Part Two, The Yoga and Its Objects, written around 1912; Part Three, writings from the Arya, 1914–21; Part Four, an essay from the Standard Bearer, 1920; Part Five, writings from the Bulletin of Physical Education, 1949–50.

PART ONE: ESSAYS FROM THE KARMAYOGIN (1909–1910)

Sri Aurobindo was the editor of and principal writer for the Karmayogin, “A Weekly Review of National Religion, Literature, Science, Philosophy, &c.”, between June 1909 and February 1910. Most of the contents of the Karmayogin are published in volume 8 of THE COMPLETE WORKS OF SRI AUROBINDO. The fourteen pieces selected for inclusion in the present volume deal with philosophical and yogic subjects rather than with politics or literature. All but two of them were published in one or more of three booklets: The Ideal of the
Karmayogin (c. 1918, 1919, 1921, 1927, 1937, 1945, 1950 and subsequently), Man — Slave or Free? (c. 1922 and subsequently) and The Need in Nationalism and Other Essays (1923).

The Ideal of the Karmayogin. Published in the first issue of the Karmayogin, 19 June 1909, and later in The Ideal of the Karmayogin.
Karmayoga. Published in the first issue of the Karmayogin, 19 June 1909, and later in The Ideal of the Karmayogin.
Man — Slave or Free? Published in the Karmayogin, 26 June 1909, and later in Man — Slave or Free? and The Need in Nationalism.
Yoga and Human Evolution. Published in the Karmayogin, 3 July 1909, and later in Man — Slave or Free?
Yoga and Hypnotism. Published in the Karmayogin, 17 July 1909, and later in Man — Slave or Free?
The Greatness of the Individual. Published in the Karmayogin, 24 July 1909, and later in The Ideal of the Karmayogin.
The Process of Evolution. Published in the Karmayogin, 18 September 1909, and later in The Ideal of the Karmayogin.
Stead and the Spirits. Published in the Karmayogin, 27 November 1909.
Stead and Maskelyne. Published in the Karmayogin, 1 January 1910.
Fate and Free-Will. Published in the Karmayogin, 29 January 1910, and later in Man — Slave or Free? and The Need in Nationalism.
The Three Purushas. Published in the Karmayogin, 12 February 1910, and later in The Ideal of the Karmayogin.
The Strength of Stillness. Published in the Karmayogin, 19 February 1910, and later in The Ideal of the Karmayogin.
The Principle of Evil. Published in the Karmayogin, 26 February 1910, and later in Man — Slave or Free? and The Need in Nationalism.
The Stress of the Hidden Spirit. Published in the Karmayogin, 26 February 1910, and later in The Ideal of the Karmayogin.

PART TWO: THE YOGA AND ITS OBJECTS (CIRCA 1912)

The Yoga and Its Objects. This essay, which is mentioned in a letter written by Sri Aurobindo in 1912, was first published as a booklet in
1921 under the title “The Yoga and Its Object”. The title was changed to the present form in the second edition, issued in 1922. New editions were published in 1931, 1938, 1943, 1946, 1949 and subsequently. In 1934 Sri Aurobindo wrote that the booklet represented “an early stage” of his sadhana “and only a part of it is applicable to the Yoga as it has at present taken form after a lapse of more than twenty years”. The Appendix consists of explanations of certain words and phrases in the essay, written by Sri Aurobindo in June 1938 in answer to questions posed by a disciple.

PART THREE: WRITINGS FROM THE ARYA (1914–1921)

The monthly *Arya*, “a Review of pure philosophy”, was launched in August 1914 and ran until January 1921. Almost all its contents were written by Sri Aurobindo, particularly after the departure of his co-editors Paul Richard and Mirra Richard (the Mother) in February 1915. We reproduce here facsimiles of the front cover of the first issue of the *Arya* and the note printed inside the cover of every issue. This note undoubtedly was written by Sri Aurobindo.

Notes on the *Arya*

The “Arya’s” Second Year. Published in the *Arya* in July 1915. The next month the same subject was dealt with in four paragraphs of the essay “Our Ideal” that were omitted when it was reprinted in the 1920 edition of *Ideal and Progress*. The omitted paragraphs are printed here as an appendix.

The “Arya’s” Fourth Year. Published in the *Arya* in July 1918. Note that while the preceding piece was written just before the beginning of the *Arya’s* second year, this one was written at the end of the fourth year of the journal.

On Ideals and Progress

First published in the *Arya* in 1915 and 1916, these five essays were issued together in 1920 under the title *Ideal and Progress*. This was the
first of three collections of essays issued in 1920 and 1921 under the series title *Ideal and Progress*. New editions were published in 1922 (lightly revised), 1946 and subsequently. In 1951 and 1966 the book appeared under the editorial title *Ideals and Progress*. Another title, *On Ideals and Progress*, which appeared above the title of the first essay in 1920 and 1922, has been used as the title of this section in the present volume.

**On Ideals.** Published in the *Arya* in June 1916.

**Yoga and Skill in Works.** Published in the *Arya* in July 1916.

**Conservation and Progress.** Published in the *Arya* in May 1916.

**The Conservative Mind and Eastern Progress.** Published in the *Arya* in July 1916.

**Our Ideal.** Published in the *Arya* in August 1915. When this essay was included in *Ideal and Progress* in 1920, four paragraphs referring to the *Arya* were deleted: the original first paragraph and the fourth, third and second paragraphs from the end. The first sentence of the last paragraph was also deleted: “We shall develop our general thought in later numbers; at present we content ourselves with restating our ideal.” When Sri Aurobindo revised the second edition, he inserted a new sentence at this point: “What then shall be our ideal?” In the present edition, the four omitted paragraphs are reproduced as an appendix to “The ‘Arya’s’ Second Year” (see above under “Notes on the *Arya*”).

**The Superman**

First published in the *Arya* in 1915, these three essays were issued together in 1920 under the title *The Superman*. This was the second collection of essays issued at that time under the series title *Ideal and Progress*. New editions were published in 1922 (lightly revised), 1944, 1950 and subsequently.

**The Superman.** Published in the *Arya* under the title “The Type of the Superman” in April 1915.

**All-Will and Free-Will.** Published in the *Arya* in March 1915.

**The Delight of Works.** Published in the *Arya* in August 1915.
Evolution

First published in the *Arya* in 1915 and 1918, these three essays were reprinted in 1920 or 1921 under the title *Evolution*. This was the third collection of essays issued at that time under the series title *Ideal and Progress*. New editions were published in 1923 (lightly revised), 1933, 1944, 1950 and subsequently.

**Evolution.** Published in the *Arya* in August 1915.

**The Inconscient.** Published in the *Arya* in September 1915.

**Materialism.** Published in the *Arya* in October 1918.

Thoughts and Glimpses

The first section, “Aphorisms”, was published in three instalments in the *Arya* in March, May and June 1915, the second, “Thoughts and Glimpses”, in two instalments in May 1916 and August 1917. Between 1920 and 1922 all the pieces were published as a booklet entitled *Thoughts and Glimpses*. New editions were published in 1923 (lightly revised), 1932, 1941, 1944, 1950 and subsequently.

Heraclitus

The chapters of this work first appeared in the *Arya* between December 1916 and June 1917. It began as an examination of *Herakleitos* by R. D. Ranade (Poona: Aryabhushana Press, 1916). Sri Aurobindo’s *Heraclitus* was published as a book in 1941 (lightly revised), 1947 and subsequently.

The Problem of Rebirth

These sixteen essays were first published in the *Arya* between 1915 and 1921. Those comprising Section I appeared without a general title in two groups: November and December 1915, and March to December 1919. Those comprising Section II came out under the headings “The Lines of Karma” and “The Higher Lines of Karma” between August 1920 and January 1921.
Sometime during the 1920s, Sri Aurobindo collected and revised the sixteen essays with the intention of publishing them as a book to be entitled *The Problem of Rebirth*. The revision included the addition of three long passages: the last paragraph of “The Significance of Rebirth”, the last three paragraphs of “Involution and Evolution”, and the last three paragraphs of “Karma, Will and Consequence”. Most of the pages of the proposed book were set in type and a few copies — possibly proof copies — were printed, but the book was never published. The letter reprinted in Appendix II explains why. It may be noted that in this letter Sri Aurobindo referred to the collection of essays as “Rebirth and Karma”. The editors, who are responsible for the division into sections, use this phrase as the subtitle of Section I. (The same phrase was used as the title of the entire book in an edition published in the United States in 1991.)

*The Problem of Rebirth* was first published posthumously in 1952. The third edition of the book, published in 1978, incorporated some revisions made by Sri Aurobindo that had not been discovered when the earlier editions were printed.

*Rebirth*. Published in the *Arya* in November 1915.

*The Reincarnating Soul*. Published in the *Arya* in December 1915.

*Rebirth, Evolution, Heredity*. Published in the *Arya* in March 1919.

*Rebirth and Soul Evolution*. Published in the *Arya* in April 1919.

*The Significance of Rebirth*. Published in the *Arya* in May 1919.

*The Ascending Unity*. Published in the *Arya* in June 1919.

*Involution and Evolution*. Published in the *Arya* in July 1919.

*Karma*. Published in the *Arya* in August 1919.

*Karma and Freedom*. Published in the *Arya* in September 1919.

*Karma, Will and Consequence*. Published in the *Arya* in October 1919.

*Rebirth and Karma*. Published in the *Arya* in November 1919.

*Karma and Justice*. Published in the *Arya* in December 1919.

*The Foundation*. Published in the *Arya* in August 1920. The title of the essay was printed under the heading “The Lines of Karma”.

*The Terrestrial Law*. Published in the *Arya* in two instalments in September and October 1920. The title of the essay was printed under the heading “The Lines of Karma”.

*Mind Nature and Law of Karma*. Published in the *Arya* in two in-
nalments in October and November/December 1920. The title of the essay was printed under the heading “The Lines of Karma”.

**The Higher Lines of Karma.** Published in two instalments in the last two issues of the *Arya*: November/December 1920 and January 1921. The second instalment was printed with the subheading “The Lines of Truth”. This subheading was deleted in the unreleased edition of *The Problem of Rebirth*.

**Appendix I: The Tangle of Karma.** This incomplete essay was written around 1927, presumably for inclusion with the other essays of *The Problem of Rebirth*.

**Appendix II: A Clarification.** Sri Aurobindo wrote this note on 25 December 1935 in reply to a question put by a disciple.

---

**Other Writings from the Arya**

**The Question of the Month**

These six pieces appeared under the heading “The Question of the Month” in the first six issues of the *Arya*, August 1914–January 1915. In 1941 the first three and the sixth pieces were published along with five reviews from the *Arya* under the title *Views and Reviews*. (These reviews are published in *Early Cultural Writings*, volume 1 of *The Complete Works of Sri Aurobindo*.) The titles of the pieces were added at that time. New editions of this book were brought out in 1946 and subsequently. In 1972 the fourth and fifth pieces were reprinted for the first time since 1914 in *The Hour of God and Other Writings*.

**The Needed Synthesis.** Published in the *Arya* in August 1914.

**“Arya” — Its Significance.** Published in the *Arya* in September 1914.

**Meditation.** Published in the *Arya* in October 1914.

**Different Methods of Writing.** Published in the *Arya* in November 1914. Editorial title. At the time *View and Reviews* was being planned, Sri Aurobindo wrote that this piece was “too slight for inclusion in a book”.

**Occult Knowledge and the Hindu Scriptures.** Published in the *Arya* in December 1914. Editorial title. In the *Arya* the following sentence preceded the question: “One of our Subscribers sends us the following Question:”
The Universal Consciousness. Published in the Arya in January 1915. In the Arya the following sentence preceded the question: “One of our subscribers in Europe puts to us the following difficulty: — ”

The News of the Month

This brief-lived feature was halted after the second issue of the Arya, September 1914.

South Indian Vaishnava Poetry

Sri Aurobindo published these essays on Andal and Nammalwar, two of the alwars or Vaishnava devotional poets of Tamil Nadu, in the Arya in May and July 1915. In the same issues he published translations of some of their poems, which he executed with the help of the poet Subramania Bharati. The translations are published in Translations, volume 5 of The Complete Works of Sri Aurobindo.

Arguments to The Life Divine

Between February 1916 and April 1917 Sri Aurobindo wrote “arguments” for Chapters XIX to XXXIII of The Life Divine as they originally appeared in the Arya. The first argument was followed by this note:

In response to the desire of some of our subscribers we shall prefix henceforth a brief summary or argument to each chapter of the “Life Divine.”

The Life Divine was revised before publication as a book in 1939–40. At this time Sri Aurobindo renumbered Arya Chapters XXVIII to XXXIII as Book Two, Part I, Chapters VII, VIII, IX, XI, XV and XVII. In the revised text all the arguments published in the Arya were omitted.

In December 1940 Sri Aurobindo wrote an “Argument in Brief” and a “Shorter Synopsis” of the first chapter of The Life Divine, possibly to show how such summaries might be made. Around the same time he wrote a draft of an argument to most of Book One, Chapter
XXIV. This contains some new turns of phrase and some explanatory material not found in the chapter itself (see especially the footnote). These three pieces are reproduced here from his manuscripts.

**PART FOUR: FROM THE STANDARD BEARER (1920)**

The *Standard Bearer* was launched in August 1920 by the Prabartak Sangha of Chandernagore, a group then working under the inspiration of Sri Aurobindo. Sri Aurobindo wrote at least one article for this monthly journal. Some of his earlier writings (for example, “Hathayoga” and “Things Seen in Symbols”, included in *Early Cultural Writings*) were also published in the *Standard Bearer*.

*Ourselves*. This essay was written for publication in the first issue of the *Standard Bearer*, 15 August 1920. The editors have compared the sometimes defective text published in the journal with that of a manuscript draft.

**PART FIVE: FROM THE BULLETIN OF PHYSICAL EDUCATION (1949 – 1950)**

*The Supramental Manifestation upon Earth*

These eight essays, Sri Aurobindo’s last prose writings, first appeared in the quarterly *Bulletin of Physical Education* (at present called *Bulletin of Sri Aurobindo International Centre of Education*) in 1949 and 1950. Unable to write as a result of his failing eyesight, Sri Aurobindo dictated them to a secretary. The series was left unfinished on his passing in December 1950. It was published as a book in 1952 under the title *The Supramental Manifestation upon Earth*. (This title was provided or at least approved by the Mother.) The book has been reprinted several times. In 1953 and subsequently it was brought out in the United States under the title *The Mind of Light*.

*Message*. Published in the *Bulletin* in February 1949; dated 30 December 1948.
The Divine Body. Published in the Bulletin in August 1949.
Supermind and Humanity. Published in the Bulletin in February 1950; dated 13 January 1950.
Mind of Light. Published in the Bulletin in August 1950.
Supermind and Mind of Light. Published in the Bulletin in November 1950.

THE PRESENT EDITION

In 1971 most of the contents of the present volume were published in The Supramental Manifestation and Other Writings, volume 16 of the Sri Aurobindo Birth Centenary Library. A new, rearranged and slightly enlarged edition was brought out in 1989.

The present edition is the first to be published under the title Essays in Philosophy and Yoga. It contains all the contents of The Supramental Manifestation and Other Writings as well as some writings that appeared in other volumes of the Centenary Library. All the constituent pieces have been checked against the versions published by Sri Aurobindo in books and journals.

The Secret of the Veda

with Selected Hymns
Publisher’s Note

This volume comprises Sri Aurobindo’s writings on and translations of the Rig Veda that were published in the monthly review *Arya* between 1914 and 1920. Most of this material appeared under three headings:

These series form the first three parts of the present volume. Other translations of Vedic hymns that came out in the *Arya*, but not under any of the above headings, make up Part Four. Sri Aurobindo’s Vedic writings and translations that did not appear in the *Arya* are published in *Vedic Studies with Writings on Philology* and *Hymns to the Mystic Fire*, volumes 14 and 16 of *The Complete Works of Sri Aurobindo*.

The Secret of the Veda
Chapter I

The Problem and Its Solution

IS THERE at all or is there still a secret of the Veda? According to current conceptions the heart of that ancient mystery has been plucked out and revealed to the gaze of all, or rather no real secret ever existed. The hymns of the Veda are the sacrificial compositions of a primitive and still barbarous race written around a system of ceremonial and propitiatory rites, addressed to personified Powers of Nature and replete with a confused mass of half-formed myth and crude astronomical allegories yet in the making. Only in the later hymns do we perceive the first appearance of deeper psychological and moral ideas — borrowed, some think, from the hostile Dravidians, the “robbers” and “Veda-haters” freely cursed in the hymns themselves, — and, however acquired, the first seed of the later Vedantic speculations. This modern theory is in accord with the received idea of a rapid human evolution from the quite recent savage; it is supported by an imposing apparatus of critical research and upheld by a number of Sciences, unhappily still young and still largely conjectural in their methods and shifting in their results, — Comparative Philology, Comparative Mythology and the Science of Comparative Religion.

It is my object in these chapters to suggest a new view of the ancient problem. I do not propose to use a negative and destructive method directed against the received solutions, but simply to present, positively and constructively, a larger and, in some sort, a complementary hypothesis built upon broader foundations, — a hypothesis which, in addition, may shed light on one or two important problems in the history of ancient thought and cult left very insufficiently solved by the ordinary theories.

We have in the Rig Veda, — the true and only Veda in the estimation of European scholars, — a body of sacrificial hymns
couched in a very ancient language which presents a number of almost insoluble difficulties. It is full of ancient forms and words which do not appear in later speech and have often to be fixed in some doubtful sense by intelligent conjecture; a mass even of the words that it has in common with classical Sanskrit seem to bear or at least to admit another significance than in the later literary tongue; and a multitude of its vocables, especially the most common, those which are most vital to the sense, are capable of a surprising number of unconnected significances which may give, according to our preference in selection, quite different complexions to whole passages, whole hymns and even to the whole thought of the Veda. In the course of several thousands of years there have been at least three considerable attempts, entirely differing from each other in their methods and results, to fix the sense of these ancient litanies. One of these is prehistoric in time and exists only by fragments in the Brahmanas and Upanishads; but we possess in its entirety the traditional interpretation of the Indian scholar Sayana and we have in our own day the interpretation constructed after an immense labour of comparison and conjecture by modern European scholarship. Both of them present one characteristic in common, the extraordinary incoherence and poverty of sense which their results stamp upon the ancient hymns. The separate lines can be given, whether naturally or by force of conjecture, a good sense or a sense that hangs together; the diction that results, if garish in style, if loaded with otiose and decorative epithets, if developing extraordinarily little of meaning in an amazing mass of gaudy figure and verbiage, can be made to run into intelligible sentences; but when we come to read the hymns as a whole we seem to be in the presence of men who, unlike the early writers of other races, were incapable of coherent and natural expression or of connected thought. Except in the briefer and simpler hymns, the language tends to be either obscure or artificial; the thoughts are either unconnected or have to be forced and beaten by the interpreter into a whole. The scholar in dealing with his text is obliged to substitute for interpretation a process almost of fabrication. We feel that he is not so much
revealing the sense as hammering and forging rebellious material into some sort of shape and consistency.

Yet these obscure and barbarous compositions have had the most splendid good fortune in all literary history. They have been the reputed source not only of some of the world’s richest and profoundest religions, but of some of its subtlest metaphysical philosophies. In the fixed tradition of thousands of years they have been revered as the origin and standard of all that can be held as authoritative and true in Brahmana and Upanishad, in Tantra and Purana, in the doctrines of great philosophical schools and in the teachings of famous saints and sages. The name borne by them was Veda, the knowledge,—the received name for the highest spiritual truth of which the human mind is capable. But if we accept the current interpretations, whether Sayana’s or the modern theory, the whole of this sublime and sacred reputation is a colossal fiction. The hymns are, on the contrary, nothing more than the naive superstitious fancies of untaught and materialistic barbarians concerned only with the most external gains and enjoyments and ignorant of all but the most elementary moral notions or religious aspirations. Nor do occasional passages, quite out of harmony with their general spirit, destroy this total impression. The true foundation or starting-point of the later religions and philosophies is the Upanishads, which have then to be conceived as a revolt of philosophical and speculative minds against the ritualistic materialism of the Vedas.

But this conception, supported by misleading European parallels, really explains nothing. Such profound and ultimate thoughts, such systems of subtle and elaborate psychology as are found in the substance of the Upanishads, do not spring out of a previous void. The human mind in its progress marches from knowledge to knowledge, or it renews and enlarges previous knowledge that has been obscured and overlaid, or it seizes on old imperfect clues and is led by them to new discoveries. The thought of the Upanishads supposes great origins anterior to itself, and these in the ordinary theories are lacking. The hypothesis, invented to fill the gap, that these ideas were borrowed
by barbarous Aryan invaders from the civilised Dravidians, is a conjecture supported only by other conjectures. It is indeed coming to be doubted whether the whole story of an Aryan invasion through the Punjab is not a myth of the philologists.

Now, in ancient Europe the schools of intellectual philosophy were preceded by the secret doctrines of the mystics; Orphic and Eleusinian mysteries prepared the rich soil of mentality out of which sprang Pythagoras and Plato. A similar starting-point is at least probable for the later march of thought in India. Much indeed of the forms and symbols of thought which we find in the Upanishads, much of the substance of the Brahmanas supposes a period in India in which thought took the form or the veil of secret teachings such as those of the Greek mysteries.

Another hiatus left by the received theories is the gulf that divides the material worship of external Nature-Powers in the Veda from the developed religion of the Greeks and from the psychological and spiritual ideas we find attached to the functions of the Gods in the Upanishads and Puranas. We may accept for the present the theory that the earliest fully intelligent form of human religion is necessarily,—since man on earth begins from the external and proceeds to the internal,—a worship of outward Nature-Powers invested with the consciousness and the personality that he finds in his own being.

Agni in the Veda is avowedly Fire; Surya is the Sun, Parjanya the Raincloud, Usha the Dawn; and if the material origin or function of some other Gods is less trenchantly clear, it is easy to render the obscure precise by philological inferences or ingenious speculation. But when we come to the worship of the Greeks not much later in date than the Veda, according to modern ideas of chronology, we find a significant change. The material attributes of the Gods are effaced or have become subordinate to psychological conceptions. The impetuous God of Fire has been converted into a lame God of Labour; Apollo, the Sun, presides over poetical and prophetic inspiration; Athene, who may plausibly be identified as in origin a Dawn-Goddess, has lost all memory of her material functions and is the wise, strong and pure Goddess of Knowledge; and there are other deities
also, Gods of War, Love, Beauty, whose material functions have disappeared if they ever existed. It is not enough to say that this change was inevitable with the progress of human civilisation: the process also of the change demands inquiry and elucidation. We see the same revolution effected in the Puranas partly by the substitution of other divine names and figures, but also in part by the same obscure process that we observe in the evolution of Greek mythology. The river Saraswati has become the Muse and Goddess of Learning; Vishnu and Rudra of the Vedas are now the supreme Godhead, members of a divine Triad and expressive separately of conservative and destructive process in the cosmos. In the Isha Upanishad we find an appeal to Surya as a God of revelatory knowledge by whose action we can arrive at the highest truth. This, too, is his function in the sacred Vedic formula of the Gayatri which was for thousands of years repeated by every Brahmin in his daily meditation; and we may note that this formula is a verse from the Rig Veda, from a hymn of the Rishi Vishwamitra. In the same Upanishad, Agni is invoked for purely moral functions as the purifier from sin, the leader of the soul by the good path to the divine Bliss, and he seems to be identified with the power of the will and responsible for human actions. In other Upanishads the Gods are clearly the symbols of sense-functions in man. Soma, the plant which yielded the mystic wine for the Vedic sacrifice, has become not only the God of the moon, but manifests himself as mind in the human being. These evolutions suppose some period, posterior to the early material worship or superior Pantheistic Animism attributed to the Vedas and prior to the developed Puranic mythology, in which the gods became invested with deeper psychological functions, a period which may well have been the Age of the Mysteries. As things stand, a gap is left or else has been created by our exclusive preoccupation with the naturalistic element in the religion of the Vedic Rishis.

I suggest that the gulf is of our own creation and does not really exist in the ancient sacred writings. The hypothesis I propose is that the Rig Veda is itself the one considerable document that remains to us from the early period of human
The Secret of the Veda

thought of which the historic Eleusinian and Orphic mysteries were the failing remnants, when the spiritual and psychological knowledge of the race was concealed, for reasons now difficult to determine, in a veil of concrete and material figures and symbols which protected the sense from the profane and revealed it to the initiated. One of the leading principles of the mystics was the sacredness and secrecy of self-knowledge and the true knowledge of the Gods. This wisdom was, they thought, unfit, perhaps even dangerous to the ordinary human mind or in any case liable to perversion and misuse and loss of virtue if revealed to vulgar and unpurified spirits. Hence they favoured the existence of an outer worship, effective but imperfect, for the profane, an inner discipline for the initiate, and clothed their language in words and images which had, equally, a spiritual sense for the elect, a concrete sense for the mass of ordinary worshippers. The Vedic hymns were conceived and constructed on this principle. Their formulas and ceremonies are, overtly, the details of an outward ritual devised for the Pantheistic Nature-Worship which was then the common religion, covertly the sacred words, the effective symbols of a spiritual experience and knowledge and a psychological discipline of self-culture which were then the highest achievement of the human race. The ritual system recognised by Sayana may, in its externalities, stand; the naturalistic sense discovered by European scholarship may, in its general conceptions, be accepted; but behind them there is always the true and still hidden secret of the Veda, — the secret words, *ninīya vacānīsi*, which were spoken for the purified in soul and the awakened in knowledge. To disengage this less obvious but more important sense by fixing the import of Vedic terms, the sense of Vedic symbols and the psychological functions of the Gods is thus a difficult but necessary task, for which these chapters and the translations that accompany them are only a preparation.

The hypothesis, if it proves to be valid, will have three advantages. It will elucidate simply and effectively the parts of the Upanishads that remain yet unintelligible or ill-understood as well as much of the origins of the Puranas. It will explain and
justify rationally the whole ancient tradition of India; for it will be found that, in sober truth, the Vedanta, Purana, Tantra, the philosophical schools and the great Indian religions do go back in their source to Vedic origins. We can see there in their original seed or in their early or even primitive forms the fundamental conceptions of later Indian thought. Thus a natural starting-point will be provided for a sounder study of Comparative Religion in the Indian field. Instead of wandering amid insecure speculations or having to account for impossible conversions and unexplained transitions we shall have a clue to a natural and progressive development satisfying to the reason. Incidentally, some light may be thrown on the obscurities of early cult and myth in other ancient nations. Finally, the incoherencies of the Vedic texts will at once be explained and disappear. They exist in appearance only, because the real thread of the sense is to be found in an inner meaning. That thread found, the hymns appear as logical and organic wholes and the expression, though alien in type to our modern ways of thinking and speaking, becomes, in its own style, just and precise and sins rather by economy of phrase than by excess, by over-pregnancy rather than by poverty of sense. The Veda ceases to be merely an interesting remnant of barbarism and takes rank among the most important of the world’s early Scriptures.
Chapter II

A Retrospect of Vedic Theory

VEDA, then, is the creation of an age anterior to our intellectual philosophies. In that original epoch thought proceeded by other methods than those of our logical reasoning and speech accepted modes of expression which in our modern habits would be inadmissible. The wisest then depended on inner experience and the suggestions of the intuitive mind for all knowledge that ranged beyond mankind’s ordinary perceptions and daily activities. Their aim was illumination, not logical conviction, their ideal the inspired seer, not the accurate reasoner. Indian tradition has faithfully preserved this account of the origin of the Vedas. The Rishi was not the individual composer of the hymn, but the seer (drasṭa) of an eternal truth and an impersonal knowledge. The language of Veda itself is Śruti, a rhythm not composed by the intellect but heard, a divine Word that came vibrating out of the Infinite to the inner audience of the man who had previously made himself fit for the impersonal knowledge. The words themselves, drṣṭi and śruti, sight and hearing, are Vedic expressions; these and cognate words signify, in the esoteric terminology of the hymns, revelatory knowledge and the contents of inspiration.

In the Vedic idea of the revelation there is no suggestion of the miraculous or the supernatural. The Rishi who employed these faculties, had acquired them by a progressive self-culture. Knowledge itself was a travelling and a reaching, or a finding and a winning; the revelation came only at the end, the light was the prize of a final victory. There is continually in the Veda this image of the journey, the soul’s march on the path of Truth. On that path, as it advances, it also ascends; new vistas of power and light open to its aspiration; it wins by a heroic effort its enlarged spiritual possessions.

From the historical point of view the Rig Veda may be
regarded as a record of a great advance made by humanity by special means at a certain period of its collective progress. In its esoteric, as well as its exoteric significance, it is the Book of Works, of the inner and the outer sacrifice; it is the spirit's hymn of battle and victory as it discovers and climbs to planes of thought and experience inaccessible to the natural or animal man, man's praise of the divine Light, Power and Grace at work in the mortal. It is far, therefore, from being an attempt to set down the results of intellectual or imaginative speculation, nor does it consist of the dogmas of a primitive religion. Only, out of the sameness of experience and out of the impersonality of the knowledge received, there arise a fixed body of conceptions constantly repeated and a fixed symbolic language which, perhaps, in that early human speech, was the inevitable form of these conceptions because alone capable by its combined concreteness and power of mystic suggestion of expressing that which for the ordinary mind of the race was inexpressible. We have, at any rate, the same notions repeated from hymn to hymn with the same constant terms and figures and frequently in the same phrases with an entire indifference to any search for poetical originality or any demand for novelty of thought and freshness of language. No pursuit of aesthetic grace, richness or beauty induces these mystic poets to vary the consecrated form which had become for them a sort of divine algebra transmitting the eternal formulae of the Knowledge to the continuous succession of the initiates.

The hymns possess indeed a finished metrical form, a constant subtlety and skill in their technique, great variations of style and poetical personality; they are not the work of rude, barbarous and primitive craftsmen, but the living breath of a supreme and conscious Art forming its creations in the puissant but well-governed movement of a self-observing inspiration. Still, all these high gifts have deliberately been exercised within one unvarying framework and always with the same materials. For the art of expression was to the Rishis only a means, not an aim; their principal preoccupation was strenuously practical, almost utilitarian, in the highest sense of utility. The hymn was to the Rishi who composed it a means of spiritual progress
for himself and for others. It rose out of his soul, it became
a power of his mind, it was the vehicle of his self-expression
in some important or even critical moment of his life’s inner
history. It helped him to express the god in him, to destroy the
devourer, the expresser of evil; it became a weapon in the hands
of the Aryan striver after perfection, it flashed forth like Indra’s
lightning against the Coverer on the slopes, the Wolf on the path,
the Robber by the streams.

The invariable fixity of Vedic thought when taken in con-
junction with its depth, richness and subtlety, gives rise to some
interesting speculations. For we may reasonably argue that such
a fixed form and substance would not easily be possible in the
beginnings of thought and psychological experience or even dur-
ing their early progress and unfolding. We may therefore surmise
that our actual Sanhita represents the close of a period, not its
commencement, nor even some of its successive stages. It is even
possible that its most ancient hymns are a comparatively modern
development or version of a more ancient¹ lyric evangel couched
in the freer and more pliable forms of a still earlier human
speech. Or the whole voluminous mass of its litanies may be only
a selection by Veda Vyasa out of a more richly vocal Aryan past.
Made, according to the common belief, by Krishna of the Isle,
the great traditional sage, the colossal compiler (Vyasa), with
his face turned towards the commencement of the Iron Age, to-
wards the centuries of increasing twilight and final darkness, it is
perhaps only the last testament of the Ages of Intuition, the lumi-
nous Dawns of the Forefathers, to their descendants, to a human
race already turning in spirit towards the lower levels and the
more easy and secure gains — secure perhaps only in appearance
— of the physical life and of the intellect and the logical reason.

But these are only speculations and inferences. Certain it is
that the old tradition of a progressive obscuration and loss of
the Veda as the law of the human cycle has been fully justified

¹ The Veda itself speaks constantly of “ancient” and “modern” Rishis, (púrvah . . .
nútanaḥ), the former remote enough to be regarded as a kind of demigods, the first
founders of knowledge.
by the event. The obscuration had already proceeded far before the opening of the next great age of Indian spirituality, the Vedantic, which struggled to preserve or recover what it yet could of the ancient knowledge. It could hardly have been otherwise. For the system of the Vedic mystics was founded upon experiences difficult to ordinary mankind and proceeded by the aid of faculties which in most of us are rudimentary and imperfectly developed and, when active at all, are mixed and irregular in their operation. Once the first intensity of the search after truth had passed, periods of fatigue and relaxation were bound to intervene in which the old truths would be partially lost. Nor once lost, could they easily be recovered by scrutinising the sense of the ancient hymns; for those hymns were couched in a language that was deliberately ambiguous.

A tongue unintelligible to us may be correctly understood once a clue has been found; a diction that is deliberately ambiguous, holds its secret much more obstinately and successfully; for it is full of lures and of indications that mislead. Therefore when the Indian mind turned again to review the sense of Veda, the task was difficult and the success only partial. One source of light still existed, the traditional knowledge handed down among those who memorised and explained the Vedic text or had charge of the Vedic ritual, — two functions that had originally been one; for in the early days the priest was also the teacher and seer. But the clearness of this light was already obscured. Even Purohits of repute performed the rites with a very imperfect knowledge of the power and the sense of the sacred words which they repeated. For the material aspects of Vedic worship had grown like a thick crust over the inner knowledge and were stifling what they had once served to protect. The Veda was already a mass of myth and ritual. The power had begun to disappear out of the symbolic ceremony; the light had departed from the mystic parable and left only a surface of apparent grotesqueness and naivete.

The Brahmanas and the Upanishads are the record of a powerful revival which took the sacred text and ritual as a starting-point for a new statement of spiritual thought and experience. This movement had two complementary aspects, one,
the conservation of the forms, another the revelation of the soul of Veda, — the first represented by the Brahmanas,\(^2\) the second by the Upanishads.

The Brahmanas labour to fix and preserve the minutiae of the Vedic ceremony, the conditions of their material effectuality, the symbolic sense and purpose of their different parts, movements, implements, the significance of texts important in the ritual, the drift of obscure allusions, the memory of ancient myths and traditions. Many of their legends are evidently posterior to the hymns, invented to explain passages which were no longer understood; others may have been part of the apparatus of original myth and parable employed by the ancient symbolists or memories of the actual historical circumstances surrounding the composition of the hymns. Oral tradition is always a light that obscures; a new symbolism working upon an old that is half lost, is likely to overgrow rather than reveal it; therefore the Brahmanas, though full of interesting hints, help us very little in our research; nor are they a safe guide to the meaning of separate texts when they attempt an exact and verbal interpretation.

The Rishis of the Upanishads followed another method. They sought to recover the lost or waning knowledge by meditation and spiritual experience and they used the text of the ancient mantras as a prop or an authority for their own intuitions and perceptions; or else the Vedic Word was a seed of thought and vision by which they recovered old truths in new forms. What they found, they expressed in other terms more intelligible to the age in which they lived. In a certain sense their handling of the texts was not disinterested; it was not governed by the scholar’s scrupulous desire to arrive at the exact intention of the words and the precise thought of the sentences in their actual framing. They were seekers of a higher than verbal truth and used words merely as suggestions for the illumination towards which they were striving. They knew not or they neglected the etymological

\(^2\) Necessarily, these and other appreciations in the chapter are brief and summary views of certain main tendencies. The Brahmanas for instance have their philosophical passages.
sense and employed often a method of symbolic interpretation of component sounds in which it is very difficult to follow them. For this reason, while the Upanishads are invaluable for the light they shed on the principal ideas and on the psychological system of the ancient Rishis, they help us as little as the Brahanas in determining the accurate sense of the texts which they quote. Their real work was to found Vedanta rather than to interpret Veda.

For this great movement resulted in a new and more permanently powerful statement of thought and spirituality, Veda culminating in Vedanta. And it held in itself two strong tendencies which worked towards the disintegration of the old Vedic thought and culture. First, it tended to subordinate more and more completely the outward ritual, the material utility of the mantra and the sacrifice to a more purely spiritual aim and intention. The balance, the synthesis preserved by the old Mystics between the external and the internal, the material and the spiritual life was displaced and disorganised. A new balance, a new synthesis was established, leaning finally towards asceticism and renunciation, and maintained itself until it was in its turn displaced and disorganised by the exaggeration of its own tendencies in Buddhism. The sacrifice, the symbolic ritual became more and more a useless survival and even an encumbrance; yet, as so often happens, by the very fact of becoming mechanical and ineffective the importance of everything that was most external in them came to be exaggerated and their minutiae irrationally enforced by that part of the national mind which still clung to them. A sharp practical division came into being, effective though never entirely recognised in theory, between Veda and Vedanta, a distinction which might be expressed in the formula, “the Veda for the priests, the Vedanta for the sages.”

The second tendency of the Vedantic movement was to disencumber itself progressively of the symbolic language, the veil of concrete myth and poetic figure, in which the Mystics had shrouded their thought and to substitute a clearer statement and more philosophical language. The complete evolution of this tendency rendered obsolete the utility not only of the Vedic
ritual but of the Vedic text. Upanishads, increasingly clear and
direct in their language, became the fountainhead of the highest
Indian thought and replaced the inspired verses of Vasishtha
and Vishwamitra.\textsuperscript{3} The Vedas, becoming less and less the in-
dispensable basis of education, were no longer studied with the
same zeal and intelligence; their symbolic language, ceasing to
be used, lost the remnant of its inner sense to new generations
whose whole manner of thought was different from that of the
Vedic forefathers. The Ages of Intuition were passing away into
the first dawn of the Age of Reason.

Buddhism completed the revolution and left of the external-
\[\text{...}^{\text{...}}\]

ities of the ancient world only some venerable pomps and
some mechanical usages. It sought to abolish the Vedic sacrifice
and to bring into use the popular vernacular in place of the
literary tongue. And although the consummation of its work
was delayed for several centuries by the revival of Hinduism
in the Puranic religions, the Veda itself benefited little by this
respite. In order to combat the popularity of the new religion it
was necessary to put forward instead of venerable but unintelli-
gible texts Scriptures written in an easy form of a more modern
Sanskrit. For the mass of the nation the Puranas pushed aside
the Veda and the forms of new religious systems took the place
of the ancient ceremonies. As the Veda had passed from the sage
to the priest, so now it began to pass from the hands of the priest
into the hands of the scholar. And in that keeping it suffered the
last mutilation of its sense and the last diminution of its true
dignity and sanctity.

Not that the dealings of Indian scholarship with the hymns,
beginning from the pre-Christian centuries, have been altogether
a record of loss. Rather it is to the scrupulous diligence and
conservative tradition of the Pandits that we owe the preserva-
tion of Veda at all after its secret had been lost and the hymns
themselves had ceased in practice to be a living Scripture. And

\[\text{...}^{\text{...}}\]

\textsuperscript{3} Again this expresses the main tendency and is subject to qualification. The Vedas are
also quoted as authorities; but as a whole it is the Upanishads that become the Book of
Knowledge, the Veda being rather the Book of Works.
even for the recovery of the lost secret the two millenniums of scholastic orthodoxy have left us some invaluable aids, a text determined scrupulously to its very accentuation, the important lexicon of Yaska and Sayana’s great commentary which in spite of its many and often startling imperfections remains still for the scholar an indispensable first step towards the formation of a sound Vedic learning.

THE SCHOLARS

The text of the Veda which we possess has remained uncorrupted for over two thousand years. It dates, so far as we know, from that great period of Indian intellectual activity, contemporaneous with the Greek efflorescence, but earlier in its beginnings, which founded the culture and civilisation recorded in the classical literature of the land. We cannot say to how much earlier a date our text may be carried. But there are certain considerations which justify us in supposing for it an almost enormous antiquity. An accurate text, accurate in every syllable, accurate in every accent, was a matter of supreme importance to the Vedic ritualists; for on scrupulous accuracy depended the effectuality of the sacrifice. We are told, for instance, in the Brahmanas the story of Twashtri who, performing a sacrifice to produce an avenger of his son slain by Indra, produced, owing to an error of accentuation, not a slayer of Indra, but one of whom Indra must be the slayer. The prodigious accuracy of the ancient Indian memory is also notorious. And the sanctity of the text prevented such interpolations, alterations, modernising revisions as have replaced by the present form of the Mahabharata the ancient epic of the Kurus. It is not, therefore, at all improbable that we have the Sanhita of Vyasa substantially as it was arranged by the great sage and compiler.

Substantially, not in its present written form. Vedic prosody differed in many respects from the prosody of classical Sanskrit and, especially, employed a greater freedom in the use of that principle of euphonic combination of separate words (sandhi) which is so peculiar a feature of the literary tongue. The Vedic
Rishis, as was natural in a living speech, followed the ear rather than fixed rule; sometimes they combined the separate words, sometimes they left them uncombined. But when the Veda came to be written down, the law of euphonic combination had assumed a much more despotic authority over the language and the ancient text was written by the grammarians as far as possible in consonance with its regulations. They were careful, however, to accompany it with another text, called the Padapatha, in which all euphonic combinations were again resolved into the original and separate words and even the components of compound words indicated.

It is a notable tribute to the fidelity of the ancient memorisers that, instead of the confusion to which this system might so easily have given rise, it is always perfectly easy to resolve the formal text into the original harmonies of Vedic prosody. And very few are the instances in which the exactness or the sound judgment of the Padapatha can be called into question.

We have, then, as our basis a text which we can confidently accept and which, even if we hold it in a few instances doubtful or defective, does not at any rate call for that often licentious labour of emendation to which some of the European classics lend themselves. This is, to start with, a priceless advantage for which we cannot be too grateful to the conscientiousness of the old Indian learning.

In certain other directions it might not be safe always to follow implicitly the scholastic tradition, — as in the ascription of the Vedic poems to their respective Rishis, wherever older tradition was not firm and sound. But these are details of minor importance. Nor is there, in my view, any good reason to doubt that we have the hymns arrayed, for the most part, in the right order of their verses and in their exact entirety. The exceptions, if they exist, are negligible in number and importance. When the hymns seem to us incoherent, it is because we do not understand them. Once the clue is found, we discover that they are perfect wholes as admirable in the structure of their thought as in their language and their rhythms.

It is when we come to the interpretation of the Veda and seek
help from ancient Indian scholarship that we feel compelled to make the largest reserves. For even in the earlier days of classical erudition the ritualistic view of the Veda was already dominant, the original sense of the words, the lines, the allusions, the clue to the structure of the thought had been long lost or obscured; nor was there in the erudite that intuition or that spiritual experience which might have partly recovered the lost secret. In such a field mere learning, especially when it is accompanied by an ingenious scholastic mind, is as often a snare as a guide.

In Yaska’s lexicon, our most important help, we have to distinguish between two elements of very disparate value. When Yaska gives as a lexicographer the various meanings of Vedic words, his authority is great and the help he gives is of the first importance. It does not appear that he possessed all the ancient significances, for many had been obliterated by Time and Change and in the absence of a scientific Philology could not be restored. But much also had been preserved by tradition. Wherever Yaska preserves this tradition and does not use a grammatical’s ingenuity, the meanings he assigns to words, although not always applicable to the text to which he refers them, can yet be confirmed as possible senses by a sound Philology. But Yaska the etymologist does not rank with Yaska the lexicographer. Scientific grammar was first developed by Indian learning, but the beginnings of sound philology we owe to modern research. Nothing can be more fanciful and lawless than the methods of mere ingenuity used by the old etymologists down even to the nineteenth century, whether in Europe or India. And when Yaska follows these methods, we are obliged to part company with him entirely. Nor in his interpretation of particular texts is he more convincing than the later erudition of Sayana.

The commentary of Sayana closes the period of original and living scholastic work on the Veda which Yaska’s Nirukta among other important authorities may be said to open. The lexicon was compiled in the earlier vigour of the Indian mind when it was assembling its prehistoric gains as the materials of a fresh outburst of originality; the Commentary is almost the last great work of the kind left to us by the classical tradition.
in its final refuge and centre in Southern India before the old culture was dislocated and broken into regional fragments by the shock of the Mahomedan conquest. Since then we have had jets of strong and original effort, scattered attempts at new birth and novel combination, but work of quite this general, massive and monumental character has hardly been possible.

The commanding merits of this great legacy of the past are obvious. Composed by Sayana with the aid of the most learned scholars of his time, it is a work representing an enormous labour of erudition, more perhaps than could have been commanded at that time by a single brain. Yet it bears the stamp of the coordinating mind. It is consistent in the mass in spite of its many inconsistencies of detail, largely planned, yet most simply, composed in a style lucid, terse and possessed of an almost literary grace one would have thought impossible in the traditional form of the Indian commentary. Nowhere is there any display of pedantry; the struggle with the difficulties of the text is skilfully veiled and there is an air of clear acuteness and of assured, yet unassuming authority which imposes even on the dissident. The first Vedic scholars in Europe admired especially the rationality of Sayana’s interpretations.

Yet, even for the external sense of the Veda, it is not possible to follow either Sayana’s method or his results without the largest reservation. It is not only that he admits in his method licences of language and construction which are unnecessary and sometimes incredible, nor that he arrives at his results, often, by a surprising inconsistency in his interpretation of common Vedic terms and even of fixed Vedic formulae. These are defects of detail, unavoidable perhaps in the state of the materials with which he had to deal. But it is the central defect of Sayana’s system that he is obsessed always by the ritualistic formula and seeks continually to force the sense of the Veda into that narrow mould. So he loses many clues of the greatest suggestiveness and importance for the external sense of the ancient Scripture,—a problem quite as interesting as its internal sense. The outcome is a representation of the Rishis, their thoughts, their culture, their aspirations, so narrow and poverty-stricken that, if accepted, it
renders the ancient reverence for the Veda, its sacred authority, its divine reputation quite incomprehensible to the reason or only explicable as a blind and unquestioning tradition of faith starting from an original error.

There are indeed other aspects and elements in the commentary, but they are subordinate or subservient to the main idea. Sayana and his helpers had to work upon a great mass of often conflicting speculation and tradition which still survived from the past. To some of its elements they had to give a formal adhesion, to others they felt bound to grant minor concessions. It is possible that to Sayana’s skill in evolving out of previous uncertainty or even confusion an interpretation which had firm shape and consistence, is due the great and long-unquestioned authority of his work.

The first element with which Sayana had to deal, the most interesting to us, was the remnant of the old spiritual, philosophic or psychological interpretations of the Sruti which were the true foundation of its sanctity. So far as these had entered into the current or orthodox conception, Sayana admits them; but they form an exceptional element in his work, insignificant in bulk and in importance. Occasionally he gives a passing mention or concession to less current psychological renderings. He mentions, for instance, but not to admit it, an old interpretation of Vritra as the Coverer who holds back from man the objects of his desire and his aspirations. For Sayana Vritra is either simply the enemy or the physical cloud-demon who holds back the waters and has to be pierced by the Rain-giver.

A second element is the mythological, or, as it might almost be called, the Puranic, — myths and stories of the gods given in their outward form without that deeper sense and symbolic fact which is the justifying truth of all Purana.

4 I use the word loosely. The terms orthodox and heterodox in the European or sectarian sense have no true application to India where opinion has always been free.

5 There is reason to suppose that Purana (legend and apologue) and Itihasa (historical tradition) were parts of Vedic culture long before the present forms of the Puranas and historical Epics were evolved.
A third element is the legendary and historic, the stories of old kings and Rishis, given in the Brahmanas or by later tradition in explanation of the obscure allusions of the Veda. Sayana's dealings with this element are marked by some hesitation. Often he accepts them as the right interpretation of the hymns; sometimes he gives an alternative sense with which he has evidently more intellectual sympathy, but wavers between the two authorities.

More important is the element of naturalistic interpretation. Not only are there the obvious or the traditional identifications, Indra, the Maruts, the triple Agni, Surya, Usha, but we find that Mitra was identified with the Day, Varuna with the Night, Aryaman and Bhaga with the Sun, the Ribhus with its rays. We have here the seeds of that naturalistic theory of the Veda to which European learning has given so wide an extension. The old Indian scholars did not use the same freedom or the same systematic minuteness in their speculations. Still this element in Sayana's commentary is the true parent of the European Science of Comparative Mythology.

But it is the ritualistic conception that pervades; that is the persistent note in which all others lose themselves. In the formula of the philosophic schools, the hymns, even while standing as a supreme authority for knowledge, are yet principally and fundamentally concerned with the Karmakanda, with works, — and by works was understood, preeminently, the ritualistic observation of the Vedic sacrifices. Sayana labours always in the light of this idea. Into this mould he moulds the language of the Veda, turning the mass of its characteristic words into the ritualistic significances, — food, priest, giver, wealth, praise, prayer, rite, sacrifice.

Wealth and food; — for it is the most egoistic and materialistic objects that are proposed as the aim of the sacrifice, possessions, strength, power, children, servants, gold, horses, cows, victory, the slaughter and the plunder of enemies, the destruction of rival and malevolent critic. As one reads and finds hymn after hymn interpreted in this sense, one begins to understand better the apparent inconsistency in the attitude of
the Gita which, regarding always the Veda as divine knowledge,\(^6\) yet censures severely the champions of an exclusive Vedism,\(^7\) all whose flowery teachings were devoted solely to material wealth, power and enjoyment.

It is the final and authoritative binding of the Veda to this lowest of all its possible senses that has been the most unfortunate result of Sayana’s commentary. The dominance of the ritualistic interpretation had already deprived India of the living use of its greatest Scripture and of the true clue to the entire sense of the Upanishads. Sayana’s commentary put a seal of finality on the old misunderstanding which could not be broken for many centuries. And its suggestions, when another civilisation discovered and set itself to study the Veda, became in the European mind the parent of fresh errors.

Nevertheless, if Sayana’s work has been a key turned with double lock on the inner sense of the Veda, it is yet indispensable for opening the antechambers of Vedic learning. All the vast labour of European erudition has not been able to replace its utility. At every step we are obliged to differ from it, but at every step we are obliged to use it. It is a necessary springing-board, or a stair that we have to use for entrance, though we must leave it behind if we wish to pass forwards into the penetralia.

\(^6\) Gita XV.15.

Chapter III

Modern Theories

It was the curiosity of a foreign culture that broke after many centuries the seal of final authoritativeness which Sayana had fixed on the ritualistic interpretation of the Veda. The ancient Scripture was delivered over to a scholarship laborious, bold in speculation, ingenious in its flights of fancy, conscientious according to its own lights, but ill-fitted to understand the method of the old mystic poets; for it was void of any sympathy with that ancient temperament, unprovided with any clue in its own intellectual or spiritual environment to the ideas hidden in the Vedic figures and parables. The result has been of a double character, on the one side the beginnings of a more minute, thorough and careful as well as a freer handling of the problems of Vedic interpretation, on the other hand a final exaggeration of its apparent material sense and the complete obscurcation of its true and inner secret.

In spite of the hardiness of its speculations and its freedom in discovery or invention the Vedic scholarship of Europe has really founded itself throughout on the traditional elements preserved in Sayana’s commentary and has not attempted an entirely independent handling of the problem. What it found in Sayana and in the Brahmanas it has developed in the light of modern theories and modern knowledge; by ingenious deductions from the comparative method applied to philology, mythology and history, by large amplifications of the existing data with the aid of ingenious speculation, by unification of the scattered indications available it has built up a complete theory of Vedic mythology, Vedic history, Vedic civilisation which fascinates by its detail and thoroughness and conceals by its apparent sureness of method the fact that this imposing edifice has been founded, for the most part, on the sands of conjecture.
The modern theory of the Veda starts with the conception, for which Sayana is responsible, of the Vedas as the hymnal of an early, primitive and largely barbaric society crude in its moral and religious conceptions, rude in its social structure and entirely childlike in its outlook upon the world that environed it. The ritualism which Sayana accepted as part of a divine knowledge and as endowed with a mysterious efficacy, European scholarship accepted as an elaboration of the old savage propitiatory sacrifices offered to imaginary superhuman personalities who might be benevolent or malevolent according as they were worshipped or neglected. The historical element admitted by Sayana was readily seized on and enlarged by new renderings and new explanations of the allusions in the hymns developed in an eager hunt for clues to the primitive history, manners and institutions of those barbarous races. The naturalistic element played a still more important role. The obvious identification of the Vedic gods in their external aspects with certain Nature-Powers was used as the starting-point for a comparative study of Aryan mythologies; the hesitating identification of certain of the less prominent deities as Sun-Powers was taken as a general clue to the system of primitive myth-making and elaborate sun-myth and star-myth theories of comparative mythology were founded. In this new light the Vedic hymnology has come to be interpreted as a half-superstitious, half-poetic allegory of Nature with an important astronomical element. The rest is partly contemporary history, partly the formulae and practices of a sacrificial ritualism, not mystic, but merely primitive and superstitious.

This interpretation is in entire harmony with the scientific theories of early human culture and of the recent emergence from the mere savage which were in vogue throughout the nineteenth century and are even now dominant. But the increase of our knowledge has considerably shaken this first and too hasty generalisation. We now know that remarkable civilisations existed in China, Egypt, Chaldea, Assyria many thousands of years ago, and it is now coming generally to be agreed that Greece and India were no exceptions to the general high culture of Asia and the Mediterranean races. If the Vedic Indians do not get the benefit
of this revised knowledge, it is due to the survival of the theory with which European erudition started, that they belonged to the so-called Aryan race and were on the same level of culture with the early Aryan Greeks, Celts, Germans as they are represented to us in the Homeric poems, the old Norse Sagas and the Roman accounts of the ancient Gaul and Teuton. Hence has arisen the theory that these Aryan races were northern barbarians who broke in from their colder climes on the old and rich civilisations of Mediterranean Europe and Dravidian India.

But the indications in the Veda on which this theory of a recent Aryan invasion is built, are very scanty in quantity and uncertain in their significance. There is no actual mention of any such invasion. The distinction between Aryan and un-Aryan on which so much has been built, seems on the mass of the evidence to indicate a cultural rather than a racial difference. The language of the hymns clearly points to a particular worship or spiritual culture as the distinguishing sign of the Aryan, — a worship of Light and of the powers of Light and a self-discipline based on the culture of the “Truth” and the aspiration to Immortality, — Ritam and Amritam. There is no reliable indication of any racial difference. It is always possible that the bulk of the peoples now inhabiting India may have been the descendants of a new race from more northern latitudes, even perhaps, as argued by Mr. Tilak, from the Arctic regions; but there is nothing in the Veda, as there is nothing in the present ethnological features of the country to prove that this descent took place near to the time of the Vedic hymns or was the slow penetration of a small body of fair-skinned barbarians into a civilised Dravidian peninsula.

1 It is urged that the Dasyus are described as black of skin and noseless in opposition to the fair and high-nosed Aryans. But the former distinction is certainly applied to the Aryan Gods and the Dasa Powers in the sense of light and darkness, and the word anāsah does not mean noseless. Even if it did, it would be wholly inapplicable to the Dravidian races; for the southern nose can give as good an account of itself as any “Aryan” proboscis in the North.

2 In India we are chiefly familiar with the old philological divisions of the Indian races and with the speculations of Mr. Risley which are founded upon these earlier generalisations. But a more advanced ethnology rejects all linguistic tests and leans to the idea of a single homogeneous race inhabiting the Indian peninsula.
Nor is it a certain conclusion from the data we possess that the early Aryan cultures — supposing the Celt, Teuton, Greek and Indian to represent one common cultural origin, — were really undeveloped and barbarous. A certain pure and high simplicity in their outward life and its organisation, a certain concreteness and vivid human familiarity in their conception of and relations with the gods they worshipped, distinguish the Aryan type from the more sumptuous and materialistic Egypto-Chaldean civilisation and its solemn and occult religions. But those characteristics are not inconsistent with a high internal culture. On the contrary, indications of a great spiritual tradition meet us at many points and negate the ordinary theory. The old Celtic races certainly possessed some of the highest philosophical conceptions and they preserve stamped upon them even to the present day the result of an early mystic and intuitional development which must have been of long standing and highly evolved to have produced such enduring results. In Greece it is probable that the Hellenic type was moulded in the same way by Orphic and Eleusinian influences and that Greek mythology, as it has come down to us, full of delicate psychological suggestions, is a legacy of the Orphic teaching. It would be only consonant with the general tradition if it turned out that Indian civilisation has throughout been the prolongation of tendencies and ideas sown in us by the Vedic forefathers. The extraordinary vitality of these early cultures which still determine for us the principal types of modern man, the main elements of his temperament, the chief tendencies of his thought, art and religion, can have proceeded from no primitive savagery. They are the result of a deep and puissant prehistoric development.

Comparative Mythology has deformed the sense of man’s early traditions by ignoring this important stage in human progress. It has founded its interpretation on a theory which saw nothing between the early savage and Plato or the Upanishads. It has supposed the early religions to have been founded on the wonder of barbarians waking up suddenly to the astonishing fact that such strange things as Dawn and Night and the Sun existed and attempting in a crude, barbaric, imaginative way to
explain their existence. And from this childlike wonder we stride at one step to the profound theories of the Greek philosophers and the Vedantic sages. Comparative Mythology is the creation of Hellenists interpreting un-Hellenic data from a standpoint which is itself founded on a misunderstanding of the Greek mind. Its method has been an ingenious play of the poetic imagination rather than a patient scientific research.

If we look at the results of the method, we find an extraordinary confusion of images and of their interpretations in which there is nowhere any coherence or consistency. It is a mass of details running into each other, getting confusedly into each other's way, disagreeing yet entangled, dependent for their validity on the licence of imaginative conjecture as our sole means of knowledge. This incoherence has even been exalted into a standard of truth; for it is seriously argued by eminent scholars that a method arriving at a more logical and well-ordered result would be disproved and discredited by its very coherency, since confusion must be supposed to be the very essence of the early mythopoetic faculty. But in that case there can be nothing binding in the results of Comparative Mythology and one theory will be as good as another; for there is no reason why one particular mass of incoherence should be held to be more valid than another mass of incoherence differently composed.

There is much that is useful in the speculations of Comparative Mythology; but in order that the bulk of its results should be sound and acceptable, it must use a more patient and consistent method and organise itself as part of a well-founded Science of Religion. We must recognise that the old religions were organic systems founded on ideas which were at least as coherent as those which constitute our modern systems of belief. We must recognise also that there has been a perfectly intelligible progressive development from the earlier to the later systems of religious creed and of philosophical thought. It is by studying our data widely and profoundly in this spirit and discovering the true evolution of human thought and belief that we shall arrive at real knowledge. The mere identification of Greek and Sanskrit names and the ingenious discovery that Heracles' pyre is
an image of the setting sun or that Paris and Helen are Greek corruptions of the Vedic Sarama and the Panis make an interesting diversion for an imaginative mind, but can by themselves lead to no serious result, even if they should prove to be correct. Nor is their correctness beyond serious doubt, for it is the vice of the fragmentary and imaginative method by which the sun and star myth interpretations are built up that they can be applied with equal ease and convincingly to any and every human tradition, belief or even actual event of history. With this method we can never be sure where we have hit on a truth or where we are listening to a mere ingenuity.

Comparative Philology can indeed be called to our aid, but, in the present state of that Science, with very little conclusiveness. Modern Philology is an immense advance on anything we have had before the nineteenth century. It has introduced a spirit of order and method in place of mere phantasy; it has given us more correct ideas of the morphology of language and of what is or is not possible in etymology. It has established a few rules which govern the phenomena of the detrition of language and guide us in the identification of the same word or of related words as they appear in the changes of different but kindred tongues. Here, however, its achievements cease. The high hopes which attended its birth, have not been fulfilled by its maturity. It has failed to create a Science of Language and we are still compelled to apply to it the apologetic description given by a great philologist after some decades of earnest labour when he was obliged to speak of his favourite pursuits as “our petty conjectural sciences”. But a conjectural Science is no Science at all. Therefore the followers of more exact and scrupulous forms of knowledge refuse that name altogether to Comparative Philology and deny even the possibility of a linguistic science.

There is, in fact, no real certainty as yet in the obtained results of Philology; for beyond one or two laws of a limited

3 E.g. Christ and his twelve apostles are, a great scholar assures us, the sun and the twelve months. The career of Napoleon is the most perfect Sun-myth in all legend or history.
application there is nowhere a sure basis. Yesterday we were all convinced that Varuna was identical with Ouranos, the Greek heaven; today this identity is denounced to us as a philological error; tomorrow it may be rehabilitated. *Parame vyoman* is a Vedic phrase which most of us would translate “in the highest heaven”, but Mr. T. Paramasiva Aiyar in his brilliant and astonishing work, *The Riks*, tells us that it means “in the lowest hollow”; for *vyoman* “means break, fissure, being literally absence of protection, (uma)”; and the reasoning which he uses is so entirely after the fashion of the modern scholar that the philologist is debarred from answering that “absence of protection” cannot possibly mean a fissure and that human language was not constructed on these principles. For Philology has failed to discover the principles on which language was constructed or rather was organically developed, and on the other hand it has preserved a sufficient amount of the old spirit of mere phantasy and ingenuity and is full of precisely such brilliances of hazardous inference. But then we arrive at this result that there is nothing to help us in deciding whether *parame vyoman* in the Veda refers to the highest heaven or to the lowest abyss. It is obvious that a philology so imperfect may be a brilliant aid, but can never be a sure guide to the sense of Veda.

We have to recognise in fact that European scholarship in its dealings with the Veda has derived an excessive prestige from its association in the popular mind with the march of European Science. The truth is that there is an enormous gulf between the patient, scrupulous and exact physical sciences and these other brilliant, but immature branches of learning upon which Vedic scholarship relies. Those are careful of their foundation, slow to generalise, solid in their conclusions; these are compelled to build upon scanty data large and sweeping theories and supply the deficiency of sure indications by an excess of conjecture and hypothesis. They are full of brilliant beginnings, but can come to no secure conclusion. They are the first rough scaffolding for a Science, but they are not as yet Sciences.

It follows that the whole problem of the interpretation of Veda still remains an open field in which any contribution that
can throw light upon the problem should be welcome. Three such contributions have proceeded from Indian scholars. Two of them follow the lines or the methods of European research, while opening up new theories which if established, would considerably alter our view of the external sense of the hymns. Mr. Tilak in his _Arctic Home in the Vedas_ has accepted the general conclusions of European scholarship, but by a fresh examination of the Vedic Dawn, the figure of the Vedic cows and the astronomical data of the hymns, has established at least a strong probability that the Aryan races descended originally from the Arctic regions in the glacial period. Mr. T. Paramasiva Aiyar by a still bolder departure has attempted to prove that the whole of the Rig Veda is a figurative representation of the geological phenomena belonging to the new birth of our planet after its long-continued glacial death in the same period of terrestrial evolution. It is difficult to accept in their mass Mr. Aiyar’s reasonings and conclusions, but he has at least thrown a new light on the great Vedic mythus of Ahi Vritra and the release of the seven rivers. His interpretation is far more consistent and probable than the current theory which is not borne out by the language of the hymns. Taken in conjunction with Mr. Tilak’s work it may serve as the starting-point for a new external interpretation of the old Scripture which will explain much that is now inexplicable and recreate for us the physical origins if not the actual physical environment of the old Aryan world.

The third Indian contribution is older in date, but nearer to my present purpose. It is the remarkable attempt by Swami Dayananda, the founder of the Arya Samaj, to re-establish the Veda as a living religious Scripture. Dayananda took as his basis a free use of the old Indian philology which he found in the Nirukta. Himself a great Sanskrit scholar, he handled his materials with remarkable power and independence. Especially creative was his use of that peculiar feature of the old Sanskrit tongue which is best expressed by a phrase of Sayana’s,—the “multi-significance of roots”. We shall see that the right following of this clue is of capital importance for understanding the peculiar method of the Vedic Rishis.
Dayananda’s interpretation of the hymns is governed by the idea that the Vedas are a plenary revelation of religious, ethical and scientific truth. Its religious teaching is monotheistic and the Vedic gods are different descriptive names of the one Deity; they are at the same time indications of His powers as we see them working in Nature and by a true understanding of the sense of the Vedas we could arrive at all the scientific truths which have been discovered by modern research.

Such a theory is, obviously, difficult to establish. The Rig Veda itself, indeed, asserts\(^4\) that the gods are only different names and expressions of one universal Being who in His own reality transcends the universe; but from the language of the hymns we are compelled to perceive in the gods not only different names, but also different forms, powers and personalities of the one Deva. The monotheism of the Veda includes in itself also the monistic, pantheistic and even polytheistic views of the cosmos and is by no means the trenchant and simple creed of modern Theism. It is only by a violent struggle with the text that we can force on it a less complex aspect.

That the ancient races were far more advanced in the physical sciences than is as yet recognised, may also be admitted. The Egyptians and Chaldeans, we now know, had discovered much that has since been rediscovered by modern Science and much also that has not been rediscovered. The ancient Indians were, at least, no mean astronomers and were always skilful physicians; nor do Hindu medicine and chemistry seem to have been of a foreign origin. It is possible that in other branches also of physical knowledge they were advanced even in early times. But the absolute completeness of scientific revelation asserted by Swami Dayananda will take a great deal of proving.

The hypothesis on which I shall conduct my own enquiry is that the Veda has a double aspect and that the two, though closely related, must be kept apart. The Rishis arranged the substance of their thought in a system of parallelism by which the same deities were at once internal and external Powers of

\(^4\) R.V. I.164.46 and 170.1.
universal Nature, and they managed its expression through a system of double values by which the same language served for their worship in both aspects. But the psychological sense predominates and is more pervading, close-knit and coherent than the physical. The Veda is primarily intended to serve for spiritual enlightenment and self-culture. It is, therefore, this sense which has first to be restored.

To this task each of the ancient and modern systems of interpretation brings an indispensable assistance. Sayana and Yaska supply the ritualistic framework of outward symbols and their large store of traditional significances and explanations. The Upanishads give their clue to the psychological and philosophical ideas of the earlier Rishis and hand down to us their method of spiritual experience and intuition. European scholarship supplies a critical method of comparative research, yet to be perfected, but capable of immensely increasing the materials available and sure eventually to give a scientific certainty and firm intellectual basis which has hitherto been lacking. Dayananda has given the clue to the linguistic secret of the Rishis and reemphasised one central idea of the Vedic religion, the idea of the One Being with the Devas expressing in numerous names and forms the many-sidedness of His unity.

With so much help from the intermediate past we may yet succeed in reconstituting this remoter antiquity and enter by the gate of the Veda into the thoughts and realities of a prehistoric wisdom.
Chapter IV

The Foundations of the Psychological Theory

A HYPOTHESIS of the sense of Veda must always proceed, to be sure and sound, from a basis that clearly emerges in the language of the Veda itself. Even if the bulk of its substance be an arrangement of symbols and figures, the sense of which has to be discovered, yet there should be clear indications in the explicit language of the hymns which will guide us to that sense. Otherwise, the symbols being themselves ambiguous, we shall be in danger of manufacturing a system out of our own imaginations and preferences instead of discovering the real purport of the figures chosen by the Rishis. In that case, however ingenious and complete our theory, it is likely to be a building in the air, brilliant, but without reality or solidity.

Our first duty, therefore, is to determine whether there is, apart from figure and symbol, in the clear language of the hymns a sufficient kernel of psychological notions to justify us in supposing at all a higher than the barbarous and primitive sense of the Veda. And afterwards we have to find, as far as possible from the internal evidence of the Sukta themselves, the interpretation of each symbol and image and the right psychological function of each of the gods. A firm and not a fluctuating sense, founded on good philological justification and fitting naturally into the context wherever it occurs, must be found for each of the fixed terms of the Veda. For, as has already been said, the language of the hymns is a language fixed and invariable; it is the carefully preserved and scrupulously respected diction consistently expressing either a formal creed and ritual or a traditional doctrine and constant experience. If the language of the Vedic Rishis were free and variable, if their ideas were evidently in a state of flux, shifting and uncertain, a convenient licence and incoherence in
the sense we attach to their terminology and the relation we
find between their ideas, might be justified or tolerated. But the
hymns themselves on the very face of them bear exactly the con-
trary testimony. We have the right therefore to demand the same
fidelity and scrupulousness in the interpreter as in the original
he interprets. There is obviously a constant relation between
the different notions and cherished terms of the Vedic religion;
incoherence and uncertainty in the interpretation will prove, not
that the face evidence of the Veda is misleading, but simply that
the interpreter has failed to discover the right relations.

If, after this initial labour has been scrupulously and care-
fully done, it can be shown by a translation of the hymns that
the interpretations we had fixed fit in naturally and easily in
whatever context, if they are found to illuminate what seemed
obscure and to create intelligible and clear coherence where there
seemed to be only confusion; if the hymns in their entirety give
thus a clear and connected sense and the successive verses show a
logical succession of related thoughts, and if the result as a whole
be a profound, consistent and antique body of doctrines, then
our hypothesis will have a right to stand besides others, to chal-
lege them where they contradict it or to complete them where
they are consistent with its findings. Nor will the probability of
our hypothesis be lessened, but rather its validity confirmed if it
be found that the body of ideas and doctrines thus revealed in the
Veda are a more antique form of subsequent Indian thought and
religious experience, the natural parent of Vedanta and Purana.

So considerable and minute a labour is beyond the scope
of these brief and summary chapters. Their object is only to
indicate for those who care to follow the clue I have myself
received, the path and its principal turnings, — the results I have
arrived at and the main indications by which the Veda itself
helps us to arrive at them. And, first, it seems to me advisable
to explain the genesis of the theory in my own mind so that
the reader may the better understand the line I have taken or,
if he chooses, check any prepossessions or personal preferences
which may have influenced or limited the right application of
reasoning to this difficult problem.
Like the majority of educated Indians I had passively accepted without examination, before myself reading the Veda, the conclusions of European Scholarship both as to the religious and as to the historical and ethnical sense of the ancient hymns. In consequence, following again the ordinary line taken by modernised Hindu opinion, I regarded the Upanishads as the most ancient source of Indian thought and religion, the true Veda, the first Book of Knowledge. The Rig Veda in the modern translations which were all I knew of this profound Scripture, represented for me an important document of our national history, but seemed of small value or importance for the history of thought or for a living spiritual experience.

My first contact with Vedic thought came indirectly while pursuing certain lines of self-development in the way of Indian Yoga, which, without my knowing it, were spontaneously converging towards the ancient and now unfrequented paths followed by our forefathers. At this time there began to arise in my mind an arrangement of symbolic names attached to certain psychological experiences which had begun to regularise themselves; and among them there came the figures of three female energies, Ila, Saraswati, Sarama, representing severally three out of the four faculties of the intuitive reason,—revelation, inspiration and intuition. Two of these names were not well known to me as names of Vedic goddesses, but were connected rather with the current Hindu religion or with old Puranic legend, Saraswati, goddess of learning and Ila, mother of the Lunar dynasty. But Sarama was familiar enough. I was unable, however, to establish any connection between the figure that rose in my mind and the Vedic hound of heaven, who was associated in my memory with the Argive Helen and represented only an image of the physical Dawn entering in its pursuit of the vanished herds of Light into the cave of the Powers of darkness. When once the clue is found, the clue of the physical Light imaging the subjective, it is easy to see that the hound of heaven may be the intuition entering into the dark caverns of the subconscious mind to prepare the delivery and out-flashing of the bright illuminations of knowledge which have there been imprisoned. But the clue was wanting
and I was obliged to suppose an identity of name without any identity of the symbol.

It was my stay in Southern India which first seriously turned my thoughts to the Veda. Two observations that were forced on my mind, gave a serious shock to my second-hand belief in the racial division between Northern Aryans and Southern Dravidians. The distinction had always rested for me on a supposed difference between the physical types of Aryan and Dravidian and a more definite incompatibility between the northern Sanskritic and the southern non-Sanskritic tongues. I knew indeed of the later theories which suppose that a single homogeneous race, Dravidian or Indo-Afghan, inhabits the Indian peninsula; but hitherto I had not attached much importance to these speculations. I could not, however, be long in Southern India without being impressed by the general recurrence of northern or “Aryan” types in the Tamil race. Wherever I turned, I seemed to recognise with a startling distinctness, not only among the Brahmins but in all castes and classes, the old familiar faces, features, figures of my friends of Maharashtra, Gujerat, Hindustan, even, though this similarity was less widely spread, of my own province Bengal. The impression I received was as if an army of all the tribes of the North had descended on the South and submerged any previous populations that may have occupied it. A general impression of a Southern type survived, but it was impossible to fix it rigidly while studying the physiognomy of individuals. And in the end I could not but perceive that whatever admixtures might have taken place, whatever regional differences might have been evolved, there remains, behind all variations, a unity of physical as well as of cultural type\(^1\) throughout India. For the rest, this is a conclusion to which ethnological speculation\(^2\) itself has an increasing tendency.

\(^1\) I prefer not to use the term race, for race is a thing much more obscure and difficult to determine than is usually imagined. In dealing with it the trenchant distinctions current in the popular mind are wholly out of place.

\(^2\) Always supposing that ethnological speculations have at all any validity. The only firm basis of ethnology is the theory of the hereditary invariability of the human skull which is now being challenged. If it disappears, the whole science disappears with it.
But what then of the sharp distinction between Aryan and Dravidian races created by the philologists? It disappears. If at all an Aryan invasion is admitted, we have either to suppose that it flooded India and determined the physical type of the people, with whatever modifications, or that it was the incursion of small bands of a less civilised race who melted away into the original population. We have then to suppose that entering a vast peninsula occupied by a civilised people, builders of great cities, extensive traders, not without mental and spiritual culture, they were yet able to impose on them their own language, religion, ideas and manners. Such a miracle would be just possible if the invaders possessed a very highly organised language, a greater force of creative mind and a more dynamic religious form and spirit.

And there was always the difference of language to support the theory of a meeting of races. But here also my preconceived ideas were disturbed and confounded. For on examining the vocables of the Tamil language, in appearance so foreign to the Sanskrit form and character, I yet found myself continually guided by words or by families of words supposed to be pure Tamil in establishing new relations between Sanskrit and its distant sister, Latin, and occasionally, between the Greek and the Sanskrit. Sometimes the Tamil vocable not only suggested the connection, but proved the missing link in a family of connected words. And it was through this Dravidian language that I came first to perceive what seems to me now the true law, origins and, as it were, the embryology of the Aryan tongues. I was unable to pursue my examination far enough to establish any definite conclusion, but it certainly seems to me that the original connection between the Dravidian and Aryan tongues was far closer and more extensive than is usually supposed and the possibility suggests itself that they may even have been two divergent families derived from one lost primitive tongue. If so, the sole remaining evidence of an Aryan invasion of Dravidian India would be the indications to be found in the Vedic hymns.

It was, therefore, with a double interest that for the first time I took up the Veda in the original, though without any
The immediate intention of a close or serious study. It did not take long to see that the Vedic indications of a racial division between Aryans and Dasyus and the identification of the latter with the indigenous Indians were of a far flimsier character than I had supposed. But far more interesting to me was the discovery of a considerable body of profound psychological thought and experience lying neglected in these ancient hymns. And the importance of this element increased in my eyes when I found, first, that the mantras of the Veda illuminated with a clear and exact light psychological experiences of my own for which I had found no sufficient explanation either in European psychology or in the teachings of Yoga or of Vedanta, so far as I was acquainted with them, and, secondly, that they shed light on obscure passages and ideas of the Upanishads to which, previously, I could attach no exact meaning and gave at the same time a new sense to much in the Puranas.

I was helped in arriving at this result by my fortunate ignorance of the commentary of Sayana. For I was left free to attribute their natural psychological significance to many ordinary and current words of the Veda, such as dhī, thought or understanding, manas, mind, mati, thought, feeling or mental state, maniṣā, intellect, rītam, truth; to give their exact shades of sense to kavi, seer, maniṣī, thinker, vipra, vipaścīt, enlightened in mind, and a number of similar words; and to hazard a psychological sense, justified by more extensive study, for words like daksā which for Sayana means strength and śravas which he renders as wealth, food or fame. The psychological theory of the Veda rests upon our right to concede their natural significance to these vocables.

Sayana gives to the words dhī, rītam, etc., very variable significances. Rītam, which is almost the key-word of any psychological or spiritual interpretation, is rendered by him sometimes as “truth”, more often “sacrifice”, occasionally in the sense of water. The psychological interpretation gives it invariably the sense of Truth. Dhī is rendered by Sayana variously “thought”, “prayer”, “action”, “food”, etc. The psychological interpretation gives it consistently the sense of thought or understanding.
And so with the other fixed terms of Veda. Moreover, Sayana’s tendency, is to obliterate all fine shades and distinctions between words and to give them their vaguest general significance. All epithets conveying ideas of mental activity mean for him simply “intelligent”, all words suggesting various ideas of force, and the Veda overflows with them, are reduced to the broad idea of strength. I found myself on the contrary impressed by the great importance of fixing and preserving the right shade of meaning and precise association to be given to different words, however close they may be to each other in their general sense. I do not see indeed why we should suppose that the Vedic Rishis, unlike all other masters of poetic style, used words pell-mell and indiscriminately without feeling their just associations and giving them their right and exact force in the verbal combination.

By following this principle I found that without departing from the simple natural and straightforward sense of words and clauses an extraordinarily large body not only of separate verses but of entire passages came at once into evidence which entirely altered the whole character of the Veda. For this Scripture then appeared to have a constant vein of the richest gold of thought and spiritual experience running all through it and appearing sometimes in small streaks, sometimes in larger bands, in the majority of its hymns. Moreover, besides the words that in their plain and ordinary sense give at once a wealth of psychological significance to their context, the Veda is full of others to which it is possible to give either an external and material or an internal and psychological value according to our conception of the general purport of Veda. For instance such words as rāye, rayi, rādhas, ratna, may mean either merely material prosperity and riches or internal felicity and plenitude applying itself equally to the subjective and the objective world; dhana, vāja, posa may mean either objective wealth, plenty and increase or all possessions internal or external, their plenitude and their growth in the life of the individual. Rāye is used in the Upanishads, in a quotation from the Rig Veda, to mean spiritual felicity; why should it be incapable of bearing that sense in the original text? Vāja occurs frequently in a context in which every other word has
a psychological significance and the mention of physical plenty comes in with a violent jar of incoherency into the homogeneous totality of the thought. Commonsense, therefore, demands that the use of these words with a psychological import should be admitted in the Veda.

But if this is done consistently, not only whole verses and passages, but whole hymns assume at once the psychological complexion. On one condition this transformation is frequently complete, leaving no word or phrase unaffected,—the condition that we should admit the symbolic character of the Vedic sacrifice. We find in the Gita the word \( \text{yaj\text{"na}} \), sacrifice, used in a symbolic sense for all action, whether internal or external, that is consecrated to the gods or to the Supreme. Was such symbolic use of the word born of a later philosophical intellectuality, or was it inherent in the Vedic idea of sacrifice? I found that in the Veda itself there were hymns in which the idea of the \( \text{yaj\text{"na}} \) or of the victim is openly symbolical, others in which the veil is quite transparent. The question then arose whether these were later compositions developing an incipient symbolism out of old superstitious practices or rather the occasional plainer statement of a sense which is in most hymns more or less carefully veiled by the figure. If there were no constant recurrence of psychological passages in the Veda, the former explanation would, no doubt, have to be accepted. But on the contrary whole hymns took naturally a psychological sense proceeding with a perfect and luminous coherency from verse to verse, where the only points of obscurity were the mention of the sacrifice or of the offering or sometimes of the officiating priest, who might be either a man or a god. If these words could be interpreted symbolically, I found always that the progression of thought became more perfect, more luminous, more coherent and the sense of the hymn in its entirety was victoriously completed. I felt therefore justified by every canon of sound criticism in pursuing my hypothesis farther and including in it the symbolic sense of the Vedic ritual.

Nevertheless here intervenes the first real difficulty of the psychological interpretation. Hitherto I had been proceeding by a perfectly straightforward and natural method of interpretation.
based on the surface meaning of the words and sentences. Now I came to an element in which the surface meaning had, in a sense, to be overridden, and this is a process in which every critical and conscientious mind must find itself beset by continual scruples. Nor can one always be sure, even with the utmost care, of having hit on the right clue and the just interpretation.

The Vedic sacrifice consists of three features, — omitting for the moment the god and the mantra, — the persons who offer, the offering and the fruits of the offering. If the yajña is the action consecrated to the gods, I could not but take the yajamāna, the giver of the sacrifice, as the doer of the action. Yajña is works, internal or external, the yajamāna must be the soul or the personality as the doer. But there were also the officiating priests, hotā, rtvij, purohita, brahma, adhvaryu etc. What was their part in the symbolism? For if we once suppose a symbolic sense for the sacrifice, we must suppose also a symbolic value for each feature of the ceremony. I found that the gods were continually spoken of as priests of the offering and in many passages it was undisguisedly a non-human power or energy which presided over the sacrifice. I perceived also that throughout Veda the elements of our personality are themselves continually personified. I had only to apply this rule inversely and to suppose that the person of the priest in the external figure represented in the internal activities figured a non-human power or energy or an element of our personality. It remained to fix the psychological sense of the different priestly offices. Here I found that the Veda itself presented a clue by its philological indications and insistences, such as the use of the word purohita in its separated form with the sense of the representative “put in front” and a frequent reference to the god Agni who symbolises the divine Will or Force in humanity that takes up the action in all consecration of works.

The offerings were more difficult to understand. Even if the Soma-wine by the context in which it occurred, its use and effect and the philological indication of its synonyms, suggested its own interpretation, what could possibly be indicated by the “ghritam”, the clarified butter in the sacrifice? And yet the word
as used in the Veda was constantly insisting on its own symbolical significance. What for instance could be made of clarified butter dropping from heaven or dripping from the horses of Indra or dripping from the mind? Obviously, this was grotesque nonsense, if the sense of ghṛta as clarified butter was anything more than a symbol used with great looseness, so that often the external sense was wholly or partly put aside in the mind of the thinker. It was possible of course to vary conveniently the sense of the words, to take ghṛta sometimes as butter and sometimes as water and manas sometimes as the mind, sometimes as food or a cake. But I found that ghṛta was constantly used in connection with the thought or the mind, that heaven in Veda was a symbol of the mind, that Indra represented the illuminated mentality and his two horses double energies of that mentality and even that the Veda sometimes speaks plainly of offering the intellect (manīṣa) as purified ghṛta to the gods, ghṛtam na pūtan maṇīṣam.¹ The word ghṛta counts also among its philological significances the sense of a rich or warm brightness. It was by this concurrence of indications that I felt justified in fixing a certain psychological significance for the figure of the clarified butter. And I found the same rule and the same method applicable to other features of the sacrifice.

The fruits of the offering were in appearance purely material — cows, horses, gold, offspring, men, physical strength, victory in battle. Here the difficulty thickened. But I had already found that the Vedic cow was an exceedingly enigmatical animal and came from no earthly herd. The word go means both cow and light and in a number of passages evidently meant light even while putting forward the image of the cow. This is clear enough when we have to do with the cows of the sun — the Homeric kine of Helios — and the cows of the Dawn. Psychologically, the physical Light might well be used as a symbol of knowledge and especially of the divine knowledge. But how could this mere possibility be tested and established? I found that passages occurred in which all the surrounding context was psychological

¹ See Rig Veda I.110.6 and III.2.1. — Ed.

www.holybooks.com
and only the image of the cow interfered with its obtrusive material suggestion. Indra is invoked as the maker of perfect forms to drink the wine of Soma; drinking he becomes full of ecstasy and a “giver of cows”; then we can attain to his most intimate or his most ultimate right thoughts, then we question him and his clear discernment brings us our highest good. It is obvious that in such a passage these cows cannot be material herds nor would the giving of physical Light carry any sense in the context. In one instance at least the psychological symbolism of the Vedic cow was established with certainty to my mind. I then applied it to other passages in which the word occurred and always I saw that it resulted in the best sense and the greatest possible coherency in the context.

The cow and horse, go and aśva, are constantly associated. Usha, the Dawn, is described as gomati aśvavatī; Dawn gives to the sacrificer horses and cows. As applied to the physical dawn gomati means accompanied by or bringing the rays of light and is an image of the dawn of illumination in the human mind. Therefore aśvavatī also cannot refer merely to the physical steed; it must have a psychological significance as well. A study of the Vedic horse led me to the conclusion that go and aśva represent the two companion ideas of Light and Energy, Consciousness and Force, which to the Vedic and Vedantic mind were the double or twin aspect of all the activities of existence.

It was apparent, therefore, that the two chief fruits of the Vedic sacrifice, wealth of cows and wealth of horses, were symbolic of richness of mental illumination and abundance of vital energy. It followed that the other fruits continually associated with these two chief results of the Vedic karma must also be capable of a psychological significance. It remained only to fix their exact purport.

Another all-important feature of Vedic symbolism is the system of the worlds and the functions of the gods. I found the clue to the symbolism of the worlds in the Vedic conception of the vyāhṛtis, the three symbolic words of the mantra, “OM Bhur Bhuvah Swah”, and in the connection of the fourth Vyahriti, Mahas, with the psychological term “Ritam”. The Rishis speak
of three cosmic divisions, Earth, the Antariksha or middle region and Heaven (Dyaus); but there is also a greater Heaven (Brihad Dyaus) called also the Wide World, the Vast (Brihat), and typified sometimes as the Great Water, Maho Arnas. This “Brihat” is again described as “Ritam Brihat” or in a triple term “Satyam Ritam Brihat”. And as the three worlds correspond to the Vyahritis, so this fourth world of the Vastness and the Truth seems to correspond to the fourth Vyahriti mentioned in the Upanishads, Mahas. In the Puranic formula the four are completed by three others, Jana, Tapas and Satya, the three supreme worlds of the Hindu cosmology. In the Veda also we have three supreme worlds whose names are not given. But in the Vedantic and Puranic system the seven worlds correspond to seven psychological principles or forms of existence, Sat, Chit, Ananda, Vijnana, Manas, Prana and Anna. Now Vijnana, the central principle, the principle of Mahas, the great world, is the Truth of things, identical with the Vedic Ritam which is the principle of Brihat, the Vast, and while in the Puranic system Mahas is followed in the ascending order by Jana, the world of Ananda, of the divine Bliss, in the Veda also Ritam, the Truth, leads upward to Mayas, Bliss. We may, therefore, be fairly sure that the two systems are identical and that both depend on the same idea of seven principles of subjective consciousness formulating themselves in seven objective worlds. On this principle I was able to identify the Vedic worlds with the corresponding psychological planes of consciousness and the whole Vedic system became clear to my mind.

With so much established the rest followed naturally and inevitably. I had already seen that the central idea of the Vedic Rishis was the transition of the human soul from a state of death to a state of immortality by the exchange of the Falsehood for the Truth, of divided and limited being for integrality and infinity. Death is the mortal state of Matter with Mind and Life involved in it; Immortality is a state of infinite being, consciousness and bliss. Man rises beyond the two firmaments, Rodasi, Heaven and Earth, mind and body, to the infinity of the Truth, Mahas,
and so to the divine Bliss. This is the “great passage” discovered by the Ancestors, the ancient Rishis.

The gods I found to be described as children of Light, sons of Aditi, of Infinity; and without exception they are described as increasing man, bringing him light, pouring on him the fullness of the waters, the abundance of the heavens, increasing the truth in him, building up the divine worlds, leading him against all attacks to the great goal, the integral felicity, the perfect bliss. Their separate functions emerged by means of their activities, their epithets, the psychological sense of the legends connected with them, the indications of the Upanishads and Puranas, the occasional side-lights from Greek myth. On the other hand the demons who opposed them, are all powers of division and limitation, Coverers, Tearers, Devourers, Confiners, Dualisers, Obstructers, as their names indicate, powers that work against the free and unified integrality of the being. These Vritras, Panis, Atris, Rakshasas, Sambara, Vala, Namuchi, are not Dravidian kings and gods, as the modern mind with its exaggerated historic sense would like them to be; they represent a more antique idea better suited to the religious and ethical preoccupations of our forefathers. They represent the struggle between the powers of the higher Good and the lower desire, and this conception of the Rig Veda and the same opposition of good and evil otherwise expressed, with less psychological subtlety, with more ethical directness in the scriptures of the Zoroastrians, our ancient neighbours and kindred, proceeded probably from a common original discipline of the Aryan culture.

Finally, I found that the systematic symbolism of the Veda was extended to the legends related of the gods and of their dealings with the ancient seers. Some of these myths, if not all, may have had, in all probability had, a naturalistic and astronomical origin; but, if so, their original sense had been supplemented by a psychological symbolism. Once the sense of the Vedic symbols is known, the spiritual intention of these legends becomes apparent and inevitable. Every element of the Veda is inextricably bound up with every other and the very nature of these compositions compels us, once we have adopted a principle of interpretation,
to carry it to its farthest rational limits. Their materials have been skilfully welded together by firm hands and any inconsistency in our handling of them shatters the whole fabric of their sense and their coherent thinking.

Thus there emerged in my mind, revealing itself as it were out of the ancient verses, a Veda which was throughout the Scripture of a great and antique religion already equipped with a profound psychological discipline, — a Scripture not confused in thought or primitive in its substance, not a medley of heterogeneous or barbarous elements, but one, complete and self-conscious in its purpose and in its purport, veiled indeed by the cover, sometimes thick, sometimes transparent, of another and material sense, but never losing sight even for a single moment of its high spiritual aim and tendency.
NO INTERPRETATION of the Veda can be sound which does not rest on a sound and secure philological basis; and yet this scripture with its obscure and antique tongue of which it is the sole remaining document offers unique philological difficulties. To rely entirely on the traditional and often imaginative renderings of the Indian scholars is impossible for any critical mind. Modern philology strives after a more secure and scientific basis, but has not yet found it.

In the psychological interpretation of the Veda there are, especially, two difficulties which can only be met by a satisfactory philological justification. This interpretation necessitates the acceptance of several new senses for a fair number of fixed technical terms of the Veda, — terms, for example like ātī, avaś, vayaś. These new renderings satisfy one test we may fairly demand; they fit into every context, clarify the sense and free us from the necessity of attributing quite different significances to the same term in a work of so fixed a form as the Veda. But this test is not sufficient. We must have, besides, a philological basis which will not only account for the new sense, but also explain how a single word came to be capable of so many different meanings, the sense attached to it by the psychological interpretation, those given to it by the old grammarians and those, if any, which are attached to it in later Sanskrit. But this is not easily possible unless we find a more scientific basis for our philological deductions than our present knowledge affords.

Secondly, the theory of the psychological interpretation depends very often on the use of a double meaning for important words, — the key-words of the secret teaching. The figure is one that is traditional in Sanskrit literature and sometimes employed with an excess of artifice in the later classical works; it is the śleṣa or rhetorical figure of double entendre. But its very artificiality
predisposes us to believe that this poetical device must belong necessarily to a later and more sophisticated culture. How are we to account for its constant presence in a work of the remotest antiquity? Moreover, there is a peculiar extension of it in the Vedic use, a deliberate employment of the “multi-significance” of Sanskrit roots in order to pack as much meaning as possible into a single word, which at first sight enhances the difficulty of the problem to an extraordinary degree. For instance, the word, aśva, usually signifying a horse, is used as a figure of the Prana, the nervous energy, the vital breath, the half-mental, half-material dynamism which links mind and matter. Its root is capable, among other senses, of the ideas of impulsion, force, possession, enjoyment, and we find all these meanings united in this figure of the Steed of Life to indicate the essential tendencies of the Pranic energy. Such a use of language would not be possible if the tongue of the Aryan forefathers obeyed the same conventions as our modern speech or were in the same stage of development. But if we can suppose that there was some peculiarity in the old Aryan tongue as it was used by the Vedic Rishis by which words were felt to be more alive, less merely conventional symbols of ideas, more free in their transitions of meaning than in our later use of speech, then we shall find that these devices were not at all artificial or far-fetched to their employers, but were rather the first natural means which would suggest themselves to men anxious at once to find new, brief and adequate formulae of speech for psychological conceptions not understood by the vulgar and to conceal the ideas contained in their formulae from a profane intelligence. I believe that this is the true explanation; it can be established, I think, by a study of the development of Aryan speech that language did pass through a stage peculiarly favourable to this cryptic and psychological use of words which in their popular handling have a plain, precise and physical significance.

I have already indicated that my first study of Tamil words had brought me to what seemed a clue to the very origins and structure of the ancient Sanskrit tongue; and so far did this clue lead that I lost sight entirely of my original subject of interest, the

www.holybooks.com
connections between Aryan and Dravidian speech, and plunged into the far more interesting research of the origins and laws of development of human language itself. It seems to me that this great inquiry and not the ordinary preoccupations of linguistic scholars should be the first and central aim of any true science of Philology.

Owing to the failure of the first hopes which attended the birth of modern Philology, its meagre results, its crystallisation into the character of a “petty conjectural science”, the idea of a Science of Language is now discredited and its very possibility, on quite insufficient reasoning, entirely denied. It seems to me impossible to acquiesce in such a final negation. If there is one thing that Modern Science has triumphantly established, it is the reign of law and process of evolution in the history of all earthly things. Whatever may be the deeper nature of Speech, in its outward manifestation as human language it is an organism, a growth, a terrestrial evolution. It contains indeed a constant psychological element and is therefore more free, flexible, consciously self-adaptive than purely physical organisms; its secret is more difficult to seize, its constituents yield themselves only to more subtle and less trenchant methods of analysis. But law and process exist in mental no less than in material phenomena in spite of their more volatile and variable appearances. Law and process must have governed the origins and developments of language. Given the necessary clue and sufficient data, they must be discoverable. It seems to me that in the Sanskrit language the clue can be found, the data lie ready for investigation.

The error of Philology which prevented it from arriving at a more satisfactory result in this direction, was its preoccupation in the physical parts of speech with the exterior morphology of language and in its psychological parts with the equally external connections of formed vocables and of grammatical inflexions in kindred languages. But the true method of Science is to go back to the origins, the embryology, the elements and more obscure processes of things. From the obvious only the obvious and superficial results. The profundities of things, their real truth, can best be discovered by penetration into the hidden things that
the surface of phenomena conceals, into that past development of which the finished forms present only secret and dispersed indications or into the possibilities from which the actualities we see are only a narrow selection. A similar method applied to the earlier forms of human speech can alone give us a real Science of Language.

It is not in a short chapter of a treatise itself brief and devoted to another subject that it is at all possible to present the results of the work that I have attempted on these lines. I can only briefly indicate the one or two features which bear directly on the subject of Vedic interpretation. And I mention them here solely to avoid any supposition in the minds of my readers that in departing from the received senses of certain Vedic words I have simply taken advantage of that freedom of ingenious conjecture which is at once one of the great attractions and one of the most serious weaknesses of modern Philology.

My researches first convinced me that words, like plants, like animals, are in no sense artificial products, but growths, — living growths of sound with certain seed-sounds as their basis. Out of these seed-sounds develop a small number of primitive root-words with an immense progeny which have their successive generations and arrange themselves in tribes, clans, families, selective groups each having a common stock and a common psychological history. For the factor which presided over the development of language was the association, by the nervous mind of primitive man, of certain general significances or rather of certain general utilities and sense-values with articulate sounds. The process of this association was also in no sense artificial but natural, governed by simple and definite psychological laws.

In their beginnings language-sounds were not used to express what we should call ideas; they were rather the vocal equivalents of certain general sensations and emotion-values. It was the nerves and not the intellect which created speech. To

1 I propose to deal with them in a separate work on “The Origins of Aryan Speech”. [See Vedic Studies with Writings on Philology, volume 14 of THE COMPLETE WORKS OF SRI AUROBINDO.]
use Vedic symbols, Agni and Vayu, not Indra, were the original artificers of human language. Mind has emerged out of vital and sensational activities; intellect in man has built itself upon a basis of sense-associations and sense-reactions. By a similar process the intellectual use of language has developed by a natural law out of the sensational and emotional. Words, which were originally vital ejections full of a vague sense-potentiality, have evolved into fixed symbols of precise intellectual significances.

In consequence, the word originally was not fixed to any precise idea. It had a general character or quality (guna), which was capable of a great number of applications and therefore of a great number of possible significances. And this guna and its results it shared with many kindred sounds. At first, therefore, word-clans, word-families started life on the communal system with a common stock of possible and realised significances and a common right to all of them; their individuality lay rather in shades of expression of the same ideas than in any exclusive right to the expression of a single idea. The early history of language was a development from this communal life of words to a system of individual property in one or more intellectual significances. The principle of partition was at first fluid, then increased in rigidity, until word-families and finally single words were able to start life on their own account. The last stage of the entirely natural growth of language comes when the life of the word is entirely subjected to the life of the idea which it represents. For in the first state of language the word is as living or even a more living force than its idea; sound determines sense. In its last state the positions have been reversed; the idea becomes all-important, the sound secondary.

Another feature of the early history of language is that it expresses at first a remarkably small stock of ideas and these are the most general notions possible and generally the most concrete, such as light, motion, touch, substance, extension, force, speed, etc. Afterwards there is a gradual increase in variety of idea and precision of idea. The progression is from the general to the particular, from the vague to the precise, from the physical to the mental, from the concrete to the abstract, from the
expression of an abundant variety of sensations about similar things to the expression of precise difference between similar things, feelings and actions. This progression is worked out by processes of association in ideas which are always the same, always recurrent and, although no doubt due to the environments and actual experiences of the men who spoke the language, wear the appearance of fixed natural laws of development. And after all what is a law but a process which has been worked out by the nature of things in response to the necessities of their environment and has become the fixed habit of their action?

From this past history of language certain consequences derive which are of considerable importance in Vedic interpretation. In the first place by a knowledge of the laws under which the relations of sound and sense formed themselves in the Sanskrit tongue and by a careful and minute study of its word-families it is possible to a great extent to restore the past history of individual words. It is possible to account for the meanings actually possessed by them, to show how they were worked out through the various stages of language-development, to establish the mutual relations of different significances and to explain how they came to be attached to the same word in spite of the wide difference and sometimes even the direct contrariety of their sense-values. It is possible also to restore lost senses of words on a sure and scientific basis and to justify them by an appeal to the observed laws of association which governed the development of the old Aryan tongues, to the secret evidence of the word itself and to the corroborative evidence of its immediate kindred. Thus instead of having a purely floating and conjectural basis for our dealings with the vocables of the Vedic language, we can work with confidence upon a solid and reliable foundation.

Naturally, it does not follow that because a Vedic word may or must have had at one time a particular significance, that significance can be safely applied to the actual text of the Veda. But we do establish a sound sense and a clear possibility of its being the right sense for the Veda. The rest is a matter of comparative study of the passages in which the word occurs and of constant fitness in the context. I have continually found that
The Secret of the Veda

a sense thus restored illumines always the context wherever it is applied and on the other hand that a sense demanded always by the context is precisely that to which we are led by the history of the word. This is a sufficient basis for a moral, if not for an absolute certainty.

Secondly, one remarkable feature of language in its inception is the enormous number of different meanings of which a single word was capable and also the enormous number of words which could be used to represent a single idea. Afterwards this tropical luxuriance came to be cut down. The intellect intervened with its growing need of precision, its growing sense of economy. The bearing capacity of words progressively diminished; and it became less and less tolerable to be burdened with a superfluous number of words for the same idea, a redundant variety of ideas for the same word. A considerable, though not too rigid economy in these respects, modified by a demand for a temperate richness of variation, became the final law of language. But the Sanskrit tongue never quite reached the final stages of this development; it dissolved too early into the Prakrit dialects. Even in its latest and most literary form it is lavish of varieties of meanings for the same word; it overflows with a redundant wealth of synonyms. Hence its extraordinary capacity for rhetorical devices which in any other language would be difficult, forced and hopelessly artificial, and especially for the figure of double sense, of ślesa.

The Vedic Sanskrit represents a still earlier stratum in the development of language. Even in its outward features it is less fixed than any classical tongue; it abounds in a variety of forms and inflexions; it is fluid and vague, yet richly subtle in its use of cases and tenses. And on its psychological side it has not yet crystallised, is not entirely hardened into the rigid forms of intellectual precision. The word for the Vedic Rishi is still a living thing, a thing of power, creative, formative. It is not yet a conventional symbol for an idea, but itself the parent and former of ideas. It carries within it the memory of its roots, is still conscient of its own history.

The Rishis’ use of language was governed by this ancient
psychology of the Word. When in English we use the word “wolf” or “cow”, we mean by it simply the animal designated; we are not conscious of any reason why we should use that particular sound for the idea except the immemorial custom of the language; and we cannot use it for any other sense or purpose except by an artificial device of style. But for the Vedic Rishi “vrika” meant the tearer and therefore, among other applications of the sense, a wolf; “dhenu” meant the fosterer, nourisher, and therefore a cow. But the original and general sense predominates, the derived and particular is secondary. Therefore, it was possible for the fashioner of the hymn to use these common words with a great pliability, sometimes putting forward the image of the wolf or the cow, sometimes using it to colour the more general sense, sometimes keeping it merely as a conventional figure for the psychological conception on which his mind was dwelling, sometimes losing sight of the image altogether. It is in the light of this psychology of the old language that we have to understand the peculiar figures of Vedic symbolism as handled by the Rishis, even to the most apparently common and concrete. It is so that words like “ghritam”, the clarified butter, “soma”, the sacred wine, and a host of others are used.

Moreover, the partitions made by the thought between different senses of the same word were much less separative than in modern speech. In English “fleet” meaning a number of ships and “fleet” meaning swift are two different words; when we use “fleet” in the first sense we do not think of the swiftness of the ship’s motion, nor when we use it in the second, do we recall the image of ships gliding rapidly over the ocean. But this was precisely what was apt to occur in the Vedic use of language. “Bhaga”, enjoyment, and “bhaga”, share, were for the Vedic mind not different words, but one word which had developed two different uses. Therefore it was easy for the Rishis to employ it in one of the two senses with the other at the back of the mind colouring its overt connotation or even to use it equally in both senses at a time by a sort of figure of cumulative significance. “Chanas” meant food but also it meant “enjoyment, pleasure”; therefore it could be used by the Rishi to suggest to the profane
mind only the food given at the sacrifice to the gods, but for the initiated it meant the Ananda, the joy of the divine bliss entering into the physical consciousness and at the same time suggested the image of the Soma-wine, at once the food of the gods and the Vedic symbol of the Ananda.

We see everywhere this use of language dominating the Word of the Vedic hymns. It was the great device by which the ancient Mystics overcame the difficulty of their task. Agni for the ordinary worshipper may have meant simply the god of the Vedic fire, or it may have meant the principle of Heat and Light in physical Nature, or to the most ignorant it may have meant simply a superhuman personage, one of the many “givers of wealth”, satisfiers of human desire. How suggest to those capable of a deeper conception the psychological functions of the God? The word itself fulfilled that service. For Agni meant the Strong, it meant the Bright, or even Force, Brilliance. So it could easily recall to the initiated, wherever it occurred, the idea of the illumined Energy which builds up the worlds and which exalts man to the Highest, the doer of the great work, the Purohit of the human sacrifice.

Or how keep it in the mind of the hearer that all these gods are personalities of the one universal Deva? The names of the gods in their very meaning recall that they are only epithets, significant names, descriptions, not personal appellations. Mitra is the Deva as the Lord of love and harmony, Bhaga as the Lord of enjoyment, Surya as the Lord of illumination, Varuna as the all-pervading Vastness and purity of the Divine supporting and perfecting the world. “The Existent is One,” says the Rishi Dirghatamas, “but the sages express It variously; they say Indra, Varuna, Mitra, Agni; they call It Agni, Yama, Matarishwan.” The initiate in the earlier days of the Vedic knowledge had no need of this express statement. The names of the gods carried to him their own significance and recalled the great fundamental truth which remained with him always.

But in the later ages the very device used by the Rishis turned against the preservation of the knowledge. For language changed its character, rejected its earlier pliability, shed off old
familiar senses; the word contracted and shrank into its outer and concrete significance. The ambrosial wine of the Ananda was forgotten in the physical offering; the image of the clarified butter recalled only the gross libation to mythological deities, lords of the fire and the cloud and the storm-blast, godheads void of any but a material energy and an external lustre. The letter lived on when the spirit was forgotten; the symbol, the body of the doctrine, remained, but the soul of knowledge had fled from its coverings.
Chapter VI

Agni and the Truth

The Rig Veda is one in all its parts. Whichever of its ten Mandalas we choose, we find the same substance, the same ideas, the same images, the same phrases. The Rishis are the seers of a single truth and use in its expression a common language. They differ in temperament and personality; some are inclined to a more rich, subtle and profound use of Vedic symbolism; others give voice to their spiritual experience in a barer and simpler diction, with less fertility of thought, richness of poetical image or depth and fullness of suggestion. Often the songs of one seer vary in their manner, range from the utmost simplicity to the most curious richness. Or there are risings and fallings in the same hymn; it proceeds from the most ordinary conventions of the general symbol of sacrifice to a movement of packed and complex thought. Some of the Suktas are plain and almost modern in their language; others baffle us at first by their semblance of antique obscurity. But these differences of manner take nothing from the unity of spiritual experience, nor are they complicated by any variation of the fixed terms and the common formulae. In the deep and mystic style of Dirghatamas Aucathya as in the melodious lucidity of Medhatithi Kanwa, in the puissant and energetic hymns of Vishwamitra as in Vasishtha’s even harmonies we have the same firm foundation of knowledge and the same scrupulous adherence to the sacred conventions of the Initiates.

From this peculiarity of the Vedic compositions it results that the method of interpretation which I have described can be equally well illustrated from a number of scattered Suktas selected from the ten Mandalas or from any small block of hymns by a single Rishi. If my purpose were to establish beyond all possibility of objection the interpretation which I am now offering, a much more detailed and considerable work would
be necessary. A critical scrutiny covering the whole of the ten Mandalas would be indispensable. To justify for instance the idea I attach to the Vedic term Ritam, the Truth, or my explanation of the symbol of the Cow of Light, I should have to cite all passages of any importance in which the idea of the Truth or the image of the Cow are introduced and establish my thesis by an examination of their sense and context. Or if I wish to prove that Indra in the Veda is really in his psychological functions the master of luminous mind typified by Dyaus, or Heaven, with its three shining realms, Rochana, I should have to examine similarly the hymns addressed to Indra and the passages in which there is a clear mention of the Vedic system of worlds. Nor could this be sufficient, so intertwined and interdependent are the notions of the Veda, without some scrutiny of the other Gods and of other important psychological terms connected with the idea of the Truth and of the mental illumination through which man arrives at it. I recognise the necessity of such a work of justification and hope to follow it out in other studies on the Vedic Truth, on the Gods of the Veda and on Vedic symbols. But a labour of this scope would be beyond the range of the present work, which is confined merely to an illustration of my method and to a brief statement of the results of my theory.

In order to illustrate the method I propose to take the first eleven Suktas of the first Mandala and to show how some of the central ideas of a psychological interpretation arise out of certain important passages or single hymns and how the surrounding context of the passages and the general thought of the hymns assume an entirely new appearance in the light of this profounder thinking.

The Sanhita of the Rig Veda, as we possess it, is arranged in ten books or Mandalas. A double principle is observed in the arrangement. Six of the Mandalas are given each to the hymns of a single Rishi or family of Rishis. Thus the second is devoted chiefly to the Suktas of the Rishi Gritsamada, the third and the seventh similarly to the great names of Vishwamitra and Vasishtha respectively, the fourth to Vamadeva, the sixth to
Bharadwaja. The fifth is occupied by the hymns of the house of Atri. In each of these Mandalas the Suktas addressed to Agni are first collected together and followed by those of which Indra is the deity; the invocations of other gods, Brihaspati, Surya, the Ribhus, Usha etc. close the Mandala. A whole book, the ninth, is given to a single god, Soma. The first, eighth and tenth Mandalas are collections of Suktas by various Rishis, but the hymns of each seer are ordinarily placed together in the order of their deities, Agni leading, Indra following, the other gods succeeding. Thus the first Mandala opens with ten hymns of the seer Madhuchchhandas, son of Vishwamitra, and an eleventh ascribed to Jetri, son of Madhuchchhandas. This last Sukta, however, is identical in style, manner and spirit with the ten that precede it and they can all be taken together as a single block of hymns one in intention and diction.

A certain principle of thought-development also has not been absent from the arrangement of these Vedic hymns. The opening Mandala seems to have been so designed that the general thought of the Veda in its various elements should gradually unroll itself under the cover of the established symbols by the voices of a certain number of Rishis who almost all rank high as thinkers and sacred singers and are, some of them, among the most famous names of Vedic tradition. Nor can it be by accident that the tenth or closing Mandala gives us, with an even greater miscellaneity of authors, the last developments of the thought of the Veda and some of the most modern in language of its Suktas. It is here that we find the Sacrifice of the Purusha and the great Hymn of the Creation. It is here also that modern scholars think they discover the first origins of the Vedantic philosophy, the Brahmavada.

In any case, the hymns of the son and grandson of Vishwamitra with which the Rig Veda opens strike admirably the first essential notes of the Vedic harmony. The first hymn, addressed to Agni, suggests the central conception of the Truth which is confirmed in the second and third Suktas invoking Indra in company with other gods. In the remaining eight hymns with Indra as the sole deity, except for one which he shares with the Maruts,
we find the symbols of the Soma and the Cow, the obstructor Vritra and the great role played by Indra in leading man to the Light and overthrowing the barriers to his progress. These hymns are therefore of crucial importance to the psychological interpretation of the Veda.

There are four verses in the Hymn to Agni, the fifth to the eighth, in which the psychological sense comes out with a great force and clearness, escaping from the veil of the symbol.

*Agni hotā kavikratuḥ, satyaś citraśravastamaḥ; devo devebhir ā gamat.*

*Yad aṅga dāśuṣe tvam, agne bhadram karīṣyasi; tavit tat satyam angiraḥ.*

*Upa tvāgne dive dive, doṣāvastar dhiyā vayam; namely bharanta emasi.*

*Rājantam adhvarāṇām, gopām ṛṭasya divivim; vardhamānam sve dame.*

In this passage we have a series of terms plainly bearing or obviously capable of a psychological sense and giving their colour to the whole context. Sayana, however, insists on a purely ritual interpretation and it is interesting to see how he arrives at it. In the first phrase we have the word *kavi* meaning a seer and, even if we take *kratu* to mean work of the sacrifice, we shall have as a result, “Agni, the priest whose work or rite is that of the seer”, a turn which at once gives a symbolic character to the sacrifice and is in itself sufficient to serve as the seed of a deeper understanding of the Veda. Sayana feels that he has to turn the difficulty at any cost and therefore he gets rid of the sense of seer for *kavi* and gives it another and unusual significance. He then explains that Agni is *satya*, true, because he brings about the true fruit of the sacrifice. *Sravas* Sayana renders “fame”, Agni has an exceedingly various renown. It would have been surely better to take the word in the sense of wealth so as to avoid the incoherency of this last rendering. We shall then have this result for the fifth verse, “Agni the priest, active in the ritual, who is true (in its fruit) — for his is the most varied wealth, — let him come, a god with the gods.”
To the sixth Rik the commentator gives a very awkward and abrupt construction and trivial turn of thought which breaks entirely the flow of the verse. “That good (in the shape of varied wealth) which thou shalt effect for the giver, thine is that. This is true, O Angiras,” that is to say, there can be no doubt about this fact, for if Agni does good to the giver by providing him with wealth, he in turn will perform fresh sacrifices to Agni, and thus the good of the sacrificer becomes the good of the god. Here again it would be better to render, “The good that thou wilt do for the giver, that is that truth of thee, O Angiras,” for we thus get at once a simpler sense and construction and an explanation of the epithet, satya, true, as applied to the god of the sacrificial fire. This is the truth of Agni that to the giver of the sacrifice he surely gives good in return.

The seventh verse offers no difficulty to the ritualistic interpretation except the curious phrase, “we come bearing the prostration.” Sayana explains that bearing here means simply doing and he renders, “To thee day by day we, by night and by day, come with the thought performing the prostration.” In the eighth verse he takes r̄tasya in the sense of truth and explains it as the true fruit of the ritual. “To thee shining, the protector of the sacrifices, manifesting always their truth (that is, their inevitable fruit), increasing in thy own house.” Again, it would be simpler and better to take r̄tam in the sense of sacrifice and to render, “To thee shining out in the sacrifices, protector of the rite, ever luminous, increasing in thy own house.” The “own house” of Agni, says the commentator, is the place of sacrifice and this is indeed called frequently enough in Sanskrit, “the house of Agni”.

We see, therefore, that with a little managing we can work out a purely ritual sense quite empty of thought even for a passage which at first sight offers a considerable wealth of psychological significance. Nevertheless, however ingeniously it is effected, flaws and cracks remain which betray the artificiality of the work. We have had to throw overboard the plain sense of kavi which adheres to it throughout the Veda and foist in an unreal rendering. We have either to divorce the two words
satya and ṛta which are closely associated in the Veda or to give a forced sense to ṛta. And throughout we have avoided the natural suggestions pressed on us by the language of the Rishi.

Let us now follow instead the opposite principle and give their full psychological value to the words of the inspired text. Kratu means in Sanskrit work or action and especially work in the sense of the sacrifice; but it means also power or strength (the Greek kratos) effective of action. Psychologically this power effective of action is the will. The word may also mean mind or intellect and Sayana admits thought or knowledge as a possible sense for kratu. Śravas means literally hearing and from this primary significance is derived its secondary sense, “fame”. But, psychologically, the idea of hearing leads up in Sanskrit to another sense which we find in śravaṇa, śruti, śruta, — revealed knowledge, the knowledge which comes by inspiration. Drṣṭi and śruti, sight and hearing, revelation and inspiration are the two chief powers of that supra-mental faculty which belongs to the old Vedic idea of the Truth, the Ritam. The word śravas is not recognised by the lexicographers in this sense, but it is accepted in the sense of a hymn, — the inspired word of the Veda. This indicates clearly that at one time it conveyed the idea of inspiration or of something inspired, whether word or knowledge. This significance, then, we are entitled to give it, provisionally at least, in the present passage; for the other sense of fame is entirely incoherent and meaningless in the context. Again the word namas is also capable of a psychological sense; for it means literally “bending down” and is applied to the act of adoring submission to the deity rendered physically by the prostration of the body. When therefore the Rishi speaks of “bearing obeisance to Agni by the thought” we can hardly doubt that he gives to namas the psychological sense of the inward prostration, the act of submission or surrender to the deity.

We get then this rendering of the four verses: —

“May Agni, priest of the offering whose will towards action is that of the seer, who is true, most rich in varied inspiration, come, a god with the gods.”
"The good that thou wilt create for the giver, that is that truth of thee, O Angiras.

"To thee day by day, O Agni, in the night and in the light we by the thought come bearing our submission, —

"To thee who shinest out from the sacrifices (or, who governest the sacrifices), guardian of the Truth and its illumination, increasing in thy own home."

The defect of the translation is that we have had to employ one and the same word for \textit{satyam} and \textit{r̃tam} whereas, as we see in the formula \textit{satyam r̃tam br̃hat}, there was a distinction in the Vedic mind between the precise significances of the two words.

Who, then, is this god Agni to whom language of so mystic a fervour is addressed, to whom functions so vast and profound are ascribed? Who is this guardian of the Truth, who is in his act its illumination, whose will in the act is the will of a seer possessed of a divine wisdom governing his richly varied inspiration? What is the Truth that he guards? And what is this good that he creates for the giver who comes always to him in thought day and night bearing as his sacrifice submission and self-surrender? Is it gold and horses and cattle that he brings or is it some diviner riches?

It is not the sacrificial Fire that is capable of these functions, nor can it be any material flame or principle of physical heat and light. Yet throughout the symbol of the sacrificial Fire is maintained. It is evident that we are in the presence of a mystic symbolism to which the fire, the sacrifice, the priest are only outward figures of a deeper teaching and yet figures which it was thought necessary to maintain and to hold constantly in front.

In the early Vedantic teaching of the Upanishads we come across a conception of the Truth which is often expressed by formulas taken from the hymns of the Veda, such as the expression already quoted, \textit{satyam r̃tam br̃hat}, — the truth, the right, the vast. This Truth is spoken of in the Veda as a path leading to felicity, leading to immortality. In the Upanishads also it is by the path of the Truth that the sage or seer, Rishi or Kavi, passes beyond. He passes out of the falsehood, out of the mortal
state into an immortal existence. We have the right therefore to assume that the same conception is in question in both Veda and Vedanta.

This psychological conception is that of a truth which is truth of divine essence, not truth of mortal sensation and appearance. It is satyam, truth of being; it is in its action ṛtam, right,— truth of divine being regulating right activity both of mind and body; it is brhat, the universal truth proceeding direct and undeformed out of the Infinite. The consciousness that corresponds to it is also infinite, brhat, large as opposed to the consciousness of the sense-mind which is founded upon limitation. The one is described as bhūmā, the large, the other as alpa, the little. Another name for this supramental or truth consciousness is Mahas which also means the great, the vast. And as for the facts of sensation and appearance which are full of falsehoods (anṛtam, not-truth or wrong application of the satyam in mental and bodily activity), we have for instruments the senses, the sense-mind (manas) and the intellect working upon their evidence, so for the truth-consciousness there are corresponding faculties,— drṣṭi, śruti, viveka, the direct vision of the truth, the direct hearing of its word, the direct discrimination of the right. Whoever is in possession of this truth-consciousness or open to the action of these faculties, is the Rishi or Kavi, sage or seer. It is these conceptions of the truth, satyam and ṛtam, that we have to apply in this opening hymn of the Veda.

Agni in the Veda is always presented in the double aspect of force and light. He is the divine power that builds up the worlds, a power which acts always with a perfect knowledge, for it is jātavedas, knower of all births, viśvāni vayunāni vidvān,— it knows all manifestations or phenomena or it possesses all forms and activities of the divine wisdom. Moreover it is repeatedly said that the gods have established Agni as the immortal in mortals, the divine power in man, the energy of fulfilment through which they do their work in him. It is this work which is symbolised by the sacrifice.

Psychologically, then, we may take Agni to be the divine will perfectly inspired by divine Wisdom, and indeed one with it,
which is the active or effective power of the Truth-consciousness. This is the obvious sense of the word kavikratuh, he whose active will or power of effectivity is that of the seer, — works, that is to say, with the knowledge which comes by the truth-consciousness and in which there is no misapplication or error. The epithets that follow confirm this interpretation. Agni is satya, true in his being; perfect possession of his own truth and the essential truth of things gives him the power to apply it perfectly in all act and movement of force. He has both the satyam and the r̄tam. Moreover, he is citraśravastamah; from the Ritam there proceeds a fullness of richly luminous and varied inspirations which give the capacity for doing the perfect work. For all these are epithets of Agni as the hotṛ, the priest of the sacrifice, he who performs the offering. Therefore it is the power of Agni to apply the Truth in the work (karma or apas) symbolised by the sacrifice, that makes him the object of human invocation. The importance of the sacrificial fire in the outward ritual corresponds to the importance of this inward force of unified Light and Power in the inward rite by which there is communication and interchange between the mortal and the Immortal. Agni is elsewhere frequently described as the envoy, dūta, the medium of that communication and interchange.

We see, then, in what capacity Agni is called to the sacrifice. “Let him come, a god with the gods.” The emphasis given to the idea of divinity by this repetition, devo devebhir, becomes intelligible when we recall the standing description of Agni as the god in human beings, the immortal in mortals, the divine guest. We may give the full psychological sense by translating, “Let him come, a divine power with the divine powers.” For in the external sense of the Veda the Gods are universal powers of physical Nature personified; in any inner sense they must be universal powers of Nature in her subjective activities, Will, Mind, etc. But in the Veda there is always a distinction between the ordinary human or mental action of these puissances, manuṣṭvat, and the divine. It is supposed that man by the right use of their mental action in the inner sacrifice to the gods can convert them into their true or divine nature, the mortal can
become immortal. Thus the Ribhus, who were at first human beings or represented human faculties, became divine and immortal powers by perfection in the work, suktayā, svapasyayā. It is a continual self-offering of the human to the divine and a continual descent of the divine into the human which seems to be symbolised in the sacrifice.

The state of immortality thus attained is conceived as a state of felicity or bliss founded on a perfect Truth and Right, satyam ṛtam. We must, I think, understand in this sense the verse that follows. “The good (happiness) which thou wilt create for the giver, that is that truth of thee, O Agni.” In other words, the essence of this truth, which is the nature of Agni, is the freedom from evil, the state of perfect good and happiness which the Ritam carries in itself and which is sure to be created in the mortal when he offers the sacrifice by the action of Agni as the divine priest. Bhadram means anything good, auspicious, happy and by itself need not carry any deep significance. But we find it in the Veda used, like ṛtam, in a special sense. It is described in one of the hymns (V.82) as the opposite of the evil dream (duḥṣapnyam), the false consciousness of that which is not the Ritam, and of duritam, false going, which means all evil and suffering. Bhadram is therefore equivalent to suvitam, right going, which means all good and felicity belonging to the state of the Truth, the Ritam. It is Mayas, the felicity, and the gods who represent the Truth-consciousness are described as mayobhuvah, those who bring or carry in their being the felicity. Thus every part of the Veda, if properly understood, throws light upon every other part. It is only when we are misled by its veils that we find in it an incoherence.

In the next verse there seems to be stated the condition of the effective sacrifice. It is the continual resort day by day, in the night and in the light, of the thought in the human being with submission, adoration, self-surrender, to the divine Will and Wisdom represented by Agni. Night and Day, Naktosāsā, are also symbolical, like all the other gods in the Veda, and the sense seems to be that in all states of consciousness, whether
illumined or obscure, there must be a constant submission and reference of all activities to the divine control.

For whether by day or night Agni shines out in the sacrifices; he is the guardian of the Truth, of the Ritam in man and defends it from the powers of darkness; he is its constant illumination burning up even in obscure and besieged states of the mind. The ideas thus briefly indicated in the eighth verse are constantly found throughout the hymns to Agni in the Rig Veda.

Agni is finally described as increasing in his own home. We can no longer be satisfied with the explanation of the own home of Agni as the “fire-room” of the Vedic householder. We must seek in the Veda itself for another interpretation and we find it in the 75th hymn of the first Mandala.

\[
\text{Yaj\=a no mitr\=avarun\=a, yaj\=a dev\=a rt\=am b\=ihat; agne yaks\=i svam damam.}
\]

“Sacrifice for us to Mitra and Varuna, sacrifice to the gods, to the Truth, the Vast; O Agni, sacrifice to thy own home.”

Here \text{rt\=am b\=ihat} and \text{svam damam} seem to express the goal of the sacrifice and this is perfectly in consonance with the imagery of the Veda which frequently describes the sacrifice as travelling towards the gods and man himself as a traveller moving towards the truth, the light or the felicity. It is evident, therefore, that the Truth, the Vast and Agni’s own home are identical. Agni and other gods are frequently spoken of as being born in the truth, dwelling in the wide or vast. The sense, then, will be in our passage that Agni the divine will and power in man increases in the truth-consciousness, its proper sphere, where false limitations are broken down, \text{ur\=av anib\=adhe}, in the wide and the limitless.

Thus in these four verses of the opening hymn of the Veda we get the first indications of the principal ideas of the Vedic Rishis,—the conception of a Truth-consciousness supramental and divine, the invocation of the gods as powers of the Truth to raise man out of the falsehoods of the mortal mind, the attainment in and by this Truth of an immortal state of perfect good and felicity and the inner sacrifice and offering of what
one has and is by the mortal to the Immortal as the means of the divine consummation. All the rest of Vedic thought in its spiritual aspects is grouped around these central conceptions.
Chapter VII

Varuna-Mitra and the Truth

IF THE idea of the Truth that we have found in the very opening hymn of the Veda really carries in itself the contents we have supposed and amounts to the conception of a supramental consciousness which is the condition of the state of immortality or beatitude and if this be the leading conception of the Vedic Rishis, we are bound to find it recurring throughout the hymns as a centre for other and dependent psychological realisations. In the very next Sukta, the second hymn of Madhuchchhandas addressed to Indra and Vayu, we find another passage full of clear and this time quite invincible psychological suggestions in which the idea of the Ritam is insisted upon with an even greater force than in the hymn to Agni. The passage comprises the last three Riks of the Sukta.

Mitraṁ huve pūtadakṣaṁ, varūṇaṁ ca riśādasam;
    dhiyaṁ ghuṭtāciṁ sādhantā.
Ṛtena mitrāvaruṇā, ṛtāvydhāv ṛtasprśā;
    kratum bhantam āśāthe.
Kaviṁ no mitrāvaruṇā, tuvijātā uruksaye;
    dakṣaṁ dadvāte apasam.

In the first Rik of this passage we have the word daḵṣa usually explained by Sayana as strength, but capable of a psychological significance, the important word ṛṣṭa in the adjectival form ghuṭtāci and the remarkable phrase dhiyaṁ ghuṭtāciṁ. The verse may be translated literally “I invoke Mitra of purified strength (or, purified discernment) and Varuna destroyer of our foes perfecting (or accomplishing) a bright understanding.”

In the second Rik we have Ritam thrice repeated and the words bhṛta and kratu, to both of which we have attached a considerable importance in the psychological interpretation of the Veda. Kratu here may mean either work of sacrifice or effective
power. In favour of the former sense we have a similar passage in the Veda in which Varuna and Mitra are said to attain to or enjoy by the Truth a mighty sacrifice, *yajñam bhrantam āṣāthe*. But this parallel is not conclusive; for while in one expression it is the sacrifice itself that is spoken of, in the other it may be the power or strength which effects the sacrifice. The verse may be translated, literally, “By Truth Mitra and Varuna, truth-increasing, truth-touching, enjoy (or, attain) a mighty work” or “a vast (effective) power.”

Finally in the third Rik we have again *dakṣa*; we have the word *kavi*, seer, already associated by Madhuchchhandas with *kratu*, work or will; we have the idea of the Truth, and we have the expression *urukṣaya*, where *uru*, wide or vast, may be an equivalent for *bhrat*, the vast, which is used to describe the world or plane of the truth-consciousness, the “own home” of Agni. I translate the verse, literally, “For us Mitra and Varuna, seers, multiply-born, wide-housed, uphold the strength (or, discernment) that does the work.”

It will at once be evident that we have in this passage of the second hymn precisely the same order of ideas and many of the same expressions as those on which we founded ourselves in the first Sukta. But the application is different and the conceptions of the purified discernment, the richly-bright understanding, *dhiyam gṛtācim*, and the action of the Truth in the work of the sacrifice, *apas*, introduce certain fresh precisions which throw further light on the central ideas of the Rishis.

The word *dakṣa*, which alone in this passage admits of some real doubt as to its sense, is usually rendered by Sayana strength. It comes from a root which, like most of its congeners, e.g. *daś*, *diś*, *dah*, suggested originally as one of its characteristic significances an aggressive pressure and hence any form of injury, but especially dividing, cutting, crushing or sometimes burning. Many of the words for strength had originally this idea of a force for injury, the aggressive strength of the fighter and slayer, the kind of force most highly prized by primitive man making a place for himself by violence on the earth he had come to inherit. We see this connection in the ordinary Sanskrit word for
strength, *balam*, which is of the same family as the Greek *ballō*, I strike, and *belos*, a weapon. The sense, strength, for *dakṣa* has the same origin.

But this idea of division led up also in the psychology of language-development to quite another order of ideas, for when man wished to have words for mental conceptions, his readiest method was to apply the figures of physical action to the mental movement. The idea of physical division or separation was thus used and converted into that of distinction. It seems to have been first applied to distinguishing by the ocular sense and then to the act of mental separation, — discernment, judgment. Thus the root *vid*, which means in Sanskrit to find or know, signifies in Greek and Latin to see. *Drṣ*, to see, meant originally to rend, tear apart, separate; *paṣ*, to see, has a similar origin. We have three almost identical roots which are very instructive in this respect, — *piṣ*, to hurt, injure, be strong; *piṣ*, to hurt, injure, be strong, crush, pound; and *piṣ*, to form, shape, organise, be reduced to the constituent parts, — all these senses betraying the original idea of separation, division, cutting apart, — with derivatives, *piṣāca*, a devil, and *piṣūna*, which means on one side harsh, cruel, wicked, treacherous, slanderous, all from the idea of injury, and at the same time “indicatory, manifesting, displaying, making clear” from the other sense of distinction. So *kṝ*, to injure, divide, scatter appears in Greek *krin̄o*, I sift, choose, judge, determine. *Dakṣa* has a similar history. It is kin to the root *daś* which in Latin gives us *doceo*, I teach and in Greek *dokeō*, I think, judge, reckon, and *dokaz̄o*, I observe, am of opinion. So also we have the kindred root *diś* meaning to point out or teach, Greek *deiknumi*. Almost identical with *dakṣa* itself is the Greek *doxa*, opinion, judgment, and *dexios*, clever, dexterous, right-hand. In Sanskrit the root *dakṣ* means to hurt, kill and also to be competent, able, the adjective *dakṣa* means clever, skilful, competent, fit, careful, attentive; *dakṣina* means clever, skilful, right-hand, like *dexios*, and the noun *dakṣa* means, besides strength and also wickedness from the sense of hurting, mental ability or fitness like other words of the family. We may compare also the word *daśā* in the sense of
mind, understanding. All this evidence taken together seems to indicate clearly enough that *dakṣa* must have meant at one time discernment, judgment, discriminative thought-power and that its sense of mental capacity is derived from this sense of mental division and not by transference of the idea of physical strength to power of mind.

We have therefore three possible senses for *dakṣa* in the Veda, strength generally, mental power or especially the power of judgment, discernment. *Dakṣa* is continually associated with *kratu*; the Rishis aspire to them together, *dakṣāya kratve*, which may mean simply, “capacity and effective power” or “will and discernment”. Continually we find the word occurring in passages where the whole context relates to mental activities. Finally, we have the goddess Dakshina who may well be a female form of Daksha, himself a god and afterwards in the Purana one of the Prajapatis, the original progenitors,—we have Dakshina associated with the manifestation of knowledge and sometimes almost identified with Usha, the divine Dawn, who is the bringer of illumination. I shall suggest that Dakshina like the more famous Ila, Saraswati and Sarama, is one of four goddesses representing the four faculties of the Ritam or Truth-consciousness,—Ila representing truth-vision or revelation, Saraswati truth-audition, inspiration, the divine word, Sarama intuition, Dakshina the separative intuitional discrimination. Daksha then will mean this discrimination whether as mental judgment on the mind-plane or as intuitional discernment on the plane of the Ritam.

The three riks with which we are dealing occur as the closing passage of a hymn of which the first three verses are addressed to Vayu alone and the next three to Indra and Vayu. Indra in the psychological interpretation of the hymns represents, as we shall see, Mind-Power. The word for the sense-faculties, *indriya*, is derived from his name. His special realm is Swar, a word which means sun or luminous, being akin to *sūra* and *sūrya*, the sun, and is used to indicate the third of the Vedic *vyāhrtis* and the third of the Vedic worlds corresponding to the principle of the pure or unobscured Mind. Surya represents the illumination
of the Ritam rising upon the mind; Swar is that plane of mental consciousness which directly receives the illumination. Vayu on the other hand is always associated with the Prana or Life-Energy which contributes to the system all the ensemble of those nervous activities that in man are the support of the mental energies governed by Indra. Their combination constitutes the normal mentality of man. These two gods are invited in the hymn to come and partake together of the Soma-wine. This wine of Soma represents, as we have abundant proof in the Veda and especially in the ninth book, a collection of more than a hundred hymns addressed to the deity Soma, the intoxication of the Ananda, the divine delight of being, inflowing upon the mind from the supramental consciousness through the Ritam or Truth. If we accept these interpretations, we can easily translate the hymn into its psychological significance.

Indra and Vayu awaken in consciousness (cetathah) to the flowings of the Soma-wine; that is to say, the mind-power and life-power working together in human mentality are to awaken to the inflowings of this Ananda, this Amrita, this delight and immortality from above. They receive them into the full plenitude of the mental and nervous energies, cetathāḥ sutānāṁ vājinīvasū. The Ananda thus received constitutes a new action preparing immortal consciousness in the mortal and Indra and Vayu are bidden to come and swiftly perfect these new workings by the participation of the thought, āyātam upa niṣkṛtam māksū dhiyā। For dhi is the thought-power, intellect or understanding. It is intermediate between the normal mentality represented by the combination of Indra and Vayu and the Ritam or truth-consciousness.

It is at this point that Varuna and Mitra intervene and our passage begins. Without the psychological clue the connection between the first part of the hymn and the close is not very clear, nor the relation between the couple Varuna-Mitra and the couple Indra-Vayu. With that clue both connections become obvious;

1 V. 5.
2 V. 6.
indeed they depend upon each other. For the earlier part of the
hymn has for its subject the preparation first of the vital forces
represented by Vayu who is alone invoked in the three opening
Riks, then of the mentality represented by the couple Indra-Vayu
for the activities of the Truth-consciousness in the human being;
the close has for its subject the working of the Truth on the
mentality so as to perfect the intellect and to enlarge the action.
Varuna and Mitra are two of the four gods who represent this
working of the Truth in the human mind and temperament.

In the style of the Veda when there is a transition of this
kind from one movement of thought to another developing out
of it, the link of connection is often indicated by the repetition in
the new movement of an important word which has already oc-
curred in the close of the movement that precedes. This principle
of suggestion by echo, as one may term it, pervades the hymns
and is a mannerism common to all the Rishis. The connecting
word here is ḍhī, thought or intellect. ḍhī differs from the more
general word, mati, which means mentality or mental action
generally and which indicates sometimes thought, sometimes
feeling, sometimes the whole mental state. ḍhī is the thought-
mind or intellect; as understanding it holds all that comes to
it, defines everything and puts it into the right place,³ or often
ḍhī indicates the activity of the intellect, particular thought or
thoughts. It is by the thought that Indra and Vayu have been
called upon to perfect the nervous mentality, niṣkṛtaṁ dhīyaṁ.
But this instrument, thought, has itself to be perfected, enriched,
clarified before the mind can become capable of free commu-
nication with the Truth-consciousness. Therefore Varuna and
Mitra, Powers of the Truth, are invoked “accomplishing a richly
luminous thought,” dhīyaṁ gṛṭkāṁ sādbantā.

This is the first occurrence in the Veda of the word gṛṭta, in a
modified adjectival form, and it is significant that it should occur
as an epithet of the Vedic word for the intellect, dhī. In other
passages also we find it continually in connection with the words
manas, maniṣā or in a context where some activity of thought is

³ The root ḍhī means to hold or to place.
The root *ghṛ* conveys the idea of a strong brightness or heat such as that of fire or the summer sun. It means also to sprinkle or anoint, Greek *chriō*. It is capable of being used to signify any liquid, but especially a bright, thick liquid. It is the ambiguity of these two possible senses of which the Vedic Rishis took advantage to indicate by the word outwardly the clarified butter in the sacrifice, inwardly a rich and bright state or activity of the brain-power, *medha*, as basis and substance of illuminated thought. By *dhiyām ghṛtācim* is meant, therefore, the intellect full of a rich and bright mental activity.

Varuna and Mitra who accomplish or perfect this state of the intellect, are distinguished by two several epithets. Mitra is *pūtadakṣa*, possessed of a purified judgment; Varuna is *riśādas*, he destroys all hurters or enemies. In the Veda there are no merely ornamental epithets. Every word is meant to tell, to add something to the sense and bear a strict relation to the thought of the sentence in which it occurs. There are two obstacles which prevent the intellect from being a perfect and luminous mirror of the truth-consciousness; first, impurity of the discernment or discriminative faculty which leads to confusion of the Truth, secondly the many causes or influences which interfere with the growth of the Truth by limiting its full application or by breaking up the connections and harmony of the thoughts that express it and which thus bring about poverty and falsification of its contents. Just as the Gods in the Veda represent universal powers descended from the Truth-consciousness which build up the harmony of the worlds and in man his progressive perfection, so the influences that work against these objects are represented by hostile agencies, Dasyus and Vritras, who seek to break up, to limit, to withhold and deny. Varuna in the Veda is always characterised as a power of wideness and purity; when, therefore, he is present in man as a conscious force of the Truth, all that limits and hurts the nature by introducing into it fault, sin and evil is destroyed by contact with him. He is *riśādas*, destroyer of the enemy, of all that seek to injure the growth. Mitra, a power like Varuna of Light and Truth, especially represents Love, Joy and Harmony, the foundations of Mayas, the Vedic beatitude.
Working with the purity of Varuna and imparting that purity to the discernment, he enables it to get rid of all discords and confusions and establish the right working of the strong and luminous intellect.

This progress enables the Truth-consciousness, the Ritam, to work in the human mentality. With the Ritam as the agency, ṛtena, increasing the action of the Truth in man, ṛāvṛdbā, touching or reaching the Truth, enabling, that is to say, the mental consciousness to come into successful contact with and possession of the Truth-consciousness, ṛtasprśā. Mitra and Varuna are able to enjoy the use of a vast effective will-power, kratuin bhantam āśābe. For it is the Will that is the chief effective agent of the inner sacrifice, but a will that is in harmony with the Truth, guided therefore by a purified discernment. The Will as it enters more and more into the wideness of the Truth-consciousness becomes itself wide and vast, free from limitation in its view and of hampering impediments in its effectivity. It works urāv amibādhe, in the wideness where there is no obstacle or wall of limitation.

Thus the two requisites on which the Vedic Rishis always insist are secured, Light and Power, the Light of the Truth working in the knowledge, dhiyaṁ ghṛtācim, the Power of the Truth working in the effective and enlightened Will, kratuin bhantam. As a result Varuna and Mitra are shown to us in the closing verse of the hymn working in the full sense of their Truth, kavi tuvijātā uruksayā. Kavi, we have seen, means possessed of the Truth-consciousness and using its faculties of vision, inspiration, intuition, discrimination. Tuvijāta is “multiply born”, for tuvi, meaning originally strength or force, is used like the French word “force” in the sense of many. But by the birth of the gods is meant always in the Veda their manifestation; thus tuvijāta signifies “manifested multiply”, in many forms and activities. Uruksaya means dwelling in the wideness, an idea which occurs frequently in the hymns; uru is equivalent to brhat, the Vast, and indicates the infinite freedom of the Truth-consciousness. Thus we have as the result of the increasing activities of the Ritam the manifestation in the human being of the Powers of wideness.
and purity, of joy and harmony, a manifestation rich in forms, seated in the wideness of the Ritam and using the faculties of the supra-mental consciousness.

This manifestation of the Powers of the Truth upholds or confirms the discernment while it does the work, *dakṣam dadhāte apasam*. The discernment, now purified and supported, works in the sense of the Truth, as a power of the Truth and accomplishes the perfection of the activities of Indra and Vayu by freeing the thought and the will from all defect and confusion in their working and results.

To confirm the interpretation we have put on the terms of this passage we may quote a Rik from the tenth Sukta of the fourth Mandala.

*Adhā hyagne krator bhadrasya dakṣasya sādhoḥ, rathīr ṛtasya bṛḥato babhūtha.*

“Then indeed, O Agni, thou becomest the charioteer of the happy will, the perfecting discernment, the Truth that is the Vast.” We have here the same idea as in the first hymn of the first Mandala, the effective will that is the nature of the Truth-consciousness, *kavikratuh*, and works out therefore in a state of beatitude the good, *bhadram*. We have in the phrase *dakṣasya sādhoḥ* at once a variant and explanation of the last phrase of the second hymn, *dakṣam apasam*, the discernment perfecting and accomplishing the inner work in man. We have the vast Truth as the consummation of these two activities of power and knowledge, Will and Discernment, *kratu* and *dakṣa*. Always the hymns of the Veda confirm each other by this reproduction of the same terms and ideas and the same relation of ideas. This would not be possible unless they were based on a coherent doctrine with a precise significance for standing terms such as *kavi, kratu, dakṣa, bhadram, ṛtam*, etc. The internal evidence of the Riks themselves establishes that this significance is psychological, as otherwise the terms lose their fixed value, their precise sense, their necessary connection, and their constant recurrence in relation to each other has to be regarded as fortuitous and void of reason or purpose.
We see then that in the second hymn we find again the same governing ideas as in the first. All is based on the central Vedic conception of the supra-mental or Truth-consciousness towards which the progressively perfected mentality of the human being labours as towards a consummation and a goal. In the first hymn this is merely stated as the aim of the sacrifice and the characteristic work of Agni. The second hymn indicates the preliminary work of preparation, by Indra and Vayu, by Mitra and Varuna, of the ordinary mentality of man through the force of the Ananda and the increasing growth of the Truth.

We shall find that the whole of the Rig Veda is practically a constant variation on this double theme, the preparation of the human being in mind and body and the fulfilment of the godhead or immortality in him by his attainment and development of the Truth and the Beatitude.
Chapter VIII

The Ashwins — Indra —
the Vishwadevas

The THIRD hymn of Madhuchchhandas is again a hymn of the Soma sacrifice. It is composed, like the second before it, in movements of three stanzas, the first addressed to the Ashwins, the second to Indra, the third to the Vishwadevas, the fourth to the goddess Saraswati. In this hymn also we have in the closing movement, in the invocation to Saraswati, a passage of clear psychological significance, of a far greater clarity indeed than those that have already helped us to understand the secret thought of the Veda.

But this whole hymn is full of psychological suggestions and we find in it the close connection and even identity which the Vedic Rishis sought to establish and perfect between the three main interests of the human soul, Thought and its final victorious illuminations, Action and its last supreme all-achieving puissances, Enjoyment and its highest spiritual ecstasies. The Soma wine symbolises the replacing of our ordinary sense-enjoyment by the divine Ananda. That substitution is brought about by divinising our thought-action, and as it progresses it helps in its turn the consummation of the movement which has brought it about. The Cow, the Horse, the Soma-Wine are the figures of this triple sacrifice. The offering of ghṛta, the clarified butter which is the yield of the cow, the offering of the horse, asvamedha, the offering of the wine of Soma are its three principal forms or elements. We have also, less prominent, the offering of the cake which is possibly symbolic of the body, of Matter.

We commence with an invocation of the two Ashwins, the two Riders on the Horse, Castor and Polydeuces of the old Mediterranean mythology. They are supposed by the comparative mythologists to represent twin stars in the heavens which
for some reason had a better fortune than the rest of the celestial host and attracted the special adoration of the Aryans. Let us, however, see how they are described in the hymn we are studying. They are first described as “Ashwins, swift-footed lords of bliss, much-enjoying, — ṛdavatpāṇi śubhaspatī purubhujā”. The word śubh, like the words ratna and candra, is capable of signifying either light or enjoyment; but in this passage it occurs in connection with the adjective purubhujā, “much-enjoying”, and the verb canasyatam, “take delight”, and must therefore be taken in the sense of weal or bliss.

Next, these twin gods are described as “Ashwins, divine souls many-actioned, thought-holding” who accept and rejoice in the words of the Mantra “with an energetic thought”, — purudāṁśasā nārā śāviraya dhiyā dhīṣnyā. Ṛ in the Veda is applicable both to gods and men and does not mean simply a man; it meant originally, I think, strong or active and then a male and is applied to the male gods, active divine souls or powers, puruṣas, opposed to the female deities, gnāh who are their energies. It still preserved in the minds of the Rishis much of its original sense, as we see from the word nṛṁna, strength, and the phrase nṛtama nṛṇām, strongest of the divine powers. Savas and its adjective śāvir gives the idea of energy, but always with an association of the farther idea of flame or light; śāvir is therefore a very appropriate epithet for dhī, thought full of a shining or flashing energy. Dhīṣnyā is connected with dhīṣanā, intellect or understanding, and is rendered by Sayana “intellectual”, buddhimantu.

Again the Ashwins are described as “effectual in action, powers of the movement, fierce-moving in their paths,” dasrā nāsatāy ārudravartani. The Vedic epithets dasra and dasma are rendered by Sayana indifferently “destroying” or “beautiful” or “bountiful” according to his caprice or convenience. I connect it with the root das not in the sense of cutting, dividing, from which it gets the two significances of destroying and giving, not in the sense of “discerning, seeing” from which it gets Sayana’s significance “beautiful”, darśaniya, but in the sense of doing, acting, shaping, accomplishing, as in purudāṁśasā in the second
Rik. Nāsatya is supposed by some to be a patronymic; the old grammarians ingeniously fabricated for it the sense of “true, not false”; but I take it from nas to move. We must remember that the Ashwins are riders on the horse, that they are described often by epithets of motion, “swift-footed”, “fierce-moving in their paths”; that Castor and Pollux in Graeco-Latin mythology protect sailors in their voyages and save them in storm and shipwreck and that in the Rig Veda also they are represented as powers that carry over the Rishis as in a ship or save them from drowning in the ocean. Nāsatyā may therefore very well mean lords of the voyage, journey, or powers of the movement. Rudravartani is rendered by modern scholars “red-pathed”, an epithet supposed to be well-suited to stars and they instance the parallel phrase, hiranyavartani, having a golden or shining path. Certainly, rudra must have meant at one time, “shining, deep-coloured, red” like the roots ruṣ and ruś, rudhira, “blood”, “red”, the Latin ruber, rutilus, rufus, all meaning red. Rodasi, the dual Vedic word for heaven and earth, meant probably, like rajas and rocana, other Vedic words for the heavenly and earthly worlds, “the shining”. On the other hand the sense of injury and violence is equally inherent in this family of words and is almost universal in the various roots which form it. “Fierce” or “violent” is therefore likely to be as good a sense for rudra as “red”. The Ashwins are both hiranyavartani and rudravartani, because they are both powers of Light and of nervous force; in the former aspect they have a bright gold movement, in the latter they are violent in their movement. In one hymn (V.75.3) we have the combination rudrā hiranyavartani, violent and moving in the paths of light; we can hardly with any respect for coherence of sense understand it to mean that the stars are red but their movement or their path is golden.

Here then, in these three verses, are an extraordinary series of psychological functions to apply to two stars of a heavenly constellation! It is evident that if this was the physical origin of the Ashwins, they have as in Greek mythology long lost their purely stellar nature; they have acquired like Athene, goddess of dawn, a psychological character and functions. They are riders
on the horse, the Ashwa, symbolic of force and especially of life-energy and nervous force, the Prana. Their common character is that they are gods of enjoyment, seekers of honey; they are physicians, they bring back youth to the old, health to the sick, wholeness to the maimed. Another characteristic is movement, swift, violent, irresistible; their rapid and indomitable chariot is a constant object of celebration and they are described here as swift-footed and violent in their paths. They are like birds in their swiftness, like the mind, like the wind (V.77.3 and 78.1). They bring in their chariot ripe or perfected satisfactions to man, they are creators of bliss, Mayas. These indications are perfectly clear. They show that the Ashwins are twin divine powers whose special function is to perfect the nervous or vital being in man in the sense of action and enjoyment. But they are also powers of Truth, of intelligent action, of right enjoyment. They are powers that appear with the Dawn, effective powers of action born out of the ocean of being who, because they are divine, are able to mentalise securely the felicities of the higher existence by a thought-faculty which finds or comes to know that true substance and true wealth:

\[ Yā dasrā sindhumātārā, manotārā rayiṇām; \\
    dhiyā devā vasvividā. (I.46.2) \]

They give that impelling energy for the great work which, having for its nature and substance the light of the Truth, carries man beyond the darkness:

\[ Yā naḥ pīparād aśvinā, jyotiṣmatī tamās tirah; \\
    tam asme rāṣṭham iṣām. (I.46.6) \]

They carry man in their ship to the other shore beyond the thoughts and states of the human mind, that is to say, to the supramental consciousness, —nāvā matinām pārāya (I.46.7). Suryā, daughter of the Sun, Lord of the Truth, mounts their car as their bride.

In the present hymn the Ashwins are invoked, as swift-moving lords of bliss who carry with them many enjoyments, to take delight in the impelling energies of the sacrifice, — yajvarīr
These impelling forces are born evidently of the drinking of the Soma wine, that is to say, of the inflow of the divine Ananda. For the expressive words, *girah*, that are to make new formations in the consciousness are already rising, the seat of the sacrifice has been piled, the vigorous juices of the Soma wine are pressed out. The Ashwins are to come as effective powers of action, *purudamisasā narā*, to take delight in the Words and to accept them into the intellect where they shall be retained for the action by a thought full of luminous energy.

They are to come to the offering of the Soma wine, in order to effect the action of the sacrifice, *dastrā*, as fulfillers of action, by giving to the delight of the action that violent movement of theirs, *rudravartani*, which carries them irresistibly on their path and overcomes all opposition. They come as powers of the Aryan journey, lords of the great human movement, *Nāsatyā*. We see throughout that it is energy which these Riders on the Horse are to give; they are to take delight in the sacrificial energies, to take up the word into an energetic thought, to bring to the sacrifice their own violent movement on the path. And it is effectiveness of action and swiftness in the great journey that is the object of this demand for energy. I would call the attention of the reader continually to the consistency of conception and coherence of structure, the easy clearness and precision of outline which the thought of the Rishis assumes by a psychological interpretation, so different from the tangled confusion and incoherent abruptness of the interpretations which ignore the supreme tradition of the Veda as a book of wisdom and deepest knowledge.

We have then this rendering for the first three verses:

“O Riders of the Steed, swift-footed, much-enjoying lords of bliss, take delight in the energies of the sacrifice.

“O Riders of the Steed, male souls effecting a manifold action, take joy of the words, O holders in the intellect, by a luminously energetic thought.

“I have piled the seat of sacrifice, I have pressed out the

1 *Yuvākavah sutā vykatabhirah*.
2 *Savitrayā dhīyā dhīṣeyā vanatam girah.*

www.holybooks.com
vigorous Soma juices; fulfillers of action, powers of the movement, come to them with your fierce speed on the path.”

As in the second hymn, so in the third the Rishi begins by invoking deities who act in the nervous or vital forces. But there he called Vayu who supplies the vital forces, brings his steeds of life; here he calls the Ashwins who use the vital forces, ride on the steed. As in the second hymn he proceeds from the vital or nervous action to the mental, he invokes in his second movement the might of Indra. The out-pressings of the wine of delight desire him, sūtā ime tvāyavah; they desire the luminous mind to take possession of them for its activities; they are purified, anvībhīs tanā, “by the fingers and the body” as Sayana explains it, by the subtle thought-powers of the pure mind and by extension in the physical consciousness as it seems to me to mean. For these “ten fingers”, if they are fingers at all, are the ten fingers of Suryā, daughter of the Sun, bride of the Ashwins. In the first hymn of the ninth Mandala this same Rishi Madhuchchhandas expands the idea which here he passes over so succinctly. He says, addressing the deity Soma, “The daughter of the Sun purifies thy Soma as it flows abroad in her straining-vessel by a continuous extension”, vāreṇa śaśvatā tanā. And immediately he adds, “The subtle ones seize it in their labour (or, in the great work, struggle, aspiration, samarye), the ten Brides, sisters in the heaven that has to be crossed”, a phrase that recalls at once the ship of the Ashwins that carries us over beyond the thoughts; for Heaven is the symbol of the pure mental consciousness in the Veda as is Earth of the physical consciousness. These sisters who dwell in the pure mind, the subtle ones, anvīḥ, the ten brides, dāsa yosānḥ, are elsewhere called the ten Časters, dāsa kṣipah, because they seize the Soma and speed it on its way. They are probably identical with the ten Rays, dāsa gāvah, sometimes spoken of in the Veda. They seem to be described as the grandchildren or descendants of the Sun, napitibhir vivasvataḥ (IX.14.5). They are aided in the task of purification by the seven forms of Thought-consciousness, sapta dhiyāyah. Again we are told that “Soma advances, heroic with his swift chariots, by the force of the subtle thought, dhiyā anvīyā, to the perfected activity
(or perfected field) of Indra and takes many forms of thought to arrive at that vast extension (or, formation) of the godhead where the Immortals are” (IX.15.1, 2).

_Eṣa puṟū dhiyāyate, bṛhate devatātaye; _
yatrāṁr̥tāsa āsate._

I have dwelt on this point in order to show how entirely symbolical is the Soma-wine of the Vedic Rishis and how richly surrounded with psychological conceptions, — as anyone will find who cares to go through the ninth Mandala with its almost overcharged splendour of symbolic imagery and overflowing psychological suggestions.

However that may be, the important point here is not the Soma and its purification but the psychological function of Indra. He is addressed as Indra of the richly-various lustres, _indra citrabhāno_. The Soma-juices desire him. He comes impelled by the thought, driven forward by the illumined thinker within, _dhiyēṣito viprajātah_, to the soul-thoughts of the Rishi who has pressed out the wine of delight and seeks to manifest them in speech, in the inspired mantras; _sutāvata upa brabhāṇī vāghataḥ_. He comes with the speed and force of the illumined mind-power, in possession of his brilliant horses to those thoughts, _tūṭujāna upa brabhāṇī harivalḥ_, and the Rishi prays to him to confirm or hold the delight in the Soma offering, _sute dadhisvā naś canah_. The Ashwins have brought and energised the pleasure of the vital system in the action of the Ananda. Indra is necessary to hold that pleasure firmly in the illuminated mind so that it may not fall away from the consciousness.

“Come, O Indra, with thy rich lustres, these Soma-juices desire thee; they are purified by the subtle powers and by extension in body.

“Come, O Indra, impelled by the mind, driven forward by the illumined thinker, to my soul-thoughts, I who have poured out the Soma-juice and seek to express them in speech.

“Come, O Indra, with forceful speed to my soul-thoughts, O lord of the bright horses; hold firm the delight in the Soma-juice.”
The Rishi next passes to the Vishwadevas, all the gods or the all-gods. It has been disputed whether these Vishwadevas form a class by themselves or are simply the gods in their generality. I take it that the phrase means the universal collectivity of the divine powers; for this sense seems to me best to correspond to the actual expressions of the hymns in which they are invoked. In this hymn they are called for a general action which supports and completes the functions of the Ashwins and Indra. They are to come to the sacrifice in their collectivity and divide among themselves, each evidently for the divine and joyous working of his proper activity, the Soma which the giver of the sacrifice distributes to them; viṣve devāsa ā gata, dāśvāmso dāśuṣaḥ sutam.

In the next Rik the call is repeated with greater insistence; they are to arrive swiftly, tuṁnayah, to the Soma offering or, it may mean, making their way through all the planes of consciousness, “waters”, which divide the physical nature of man from their godhead and are full of obstacles to communication between earth and heaven; aptuṁaḥ sutam ā gantā tuṁnayah. They are to come like cattle hastening to the stalls of their rest at evening-tide, usrā ivaivasarāṇī. Thus gladly arriving, they are gladly to accept and cleave to the sacrifice and support it, bearing it up in its journey to its goal, in its ascent to the gods or to the home of the gods, the Truth, the Vast; medhaṁ jūṣanta vāṁnayah.

And the epithets of the Vishwadevas, qualifying their character and the functions for which they are invited to the Soma-offering, have the same generality; they are common to all the gods and applied indifferently to any or all of them throughout the Veda. They are fosterers or increasers of man and upholders of his labour and effort in the work, the sacrifice,—omāsaś caraṇaṁdērito. Sayana renders these words protectors and sustainers of men. I need not enter here into a full justification of the significances which I prefer to give them; for I have already indicated the philological method which I follow. Sayana himself finds it impossible to attribute always the sense of protection to the words derived from the root av, avas, āti, īma, etc. which are so common in the hymns, and is obliged to give to the same word in different passages the most diverse and unconnected
significances. Similarly, while it is easy to attribute the sense of “man” to the two kindred words carṣaṇi and kṛṣṭi when they stand by themselves, this meaning seems unaccountably to disappear in compound forms like vicarṣaṇi, viśvacarṣaṇi, viśvakṛṣṭi. Sayana himself is obliged to render viśvacarṣaṇi “all-seeing” and not “all-man” or “all-human”. I do not admit the possibility of such abysmal variations in fixed Vedic terms. Av can mean to be, have, keep; contain, protect; become, create; foster, increase, thrive, prosper; gladden, be glad; but it is the sense of increasing or fostering which seems to me to prevail in the Veda. Carṣ and kṛṣ were originally derivate roots from car and kṛ, both meaning to do, and the sense of laborious action or movement still remains in kṛṣ, to drag, to plough. Carṣaṇi and kṛṣṭi mean therefore effort, laborious action or work or else the doers of such action. They are two among the many words, (karma, apas, kāra, kīri, duvas etc.), which are used to indicate the Vedic work, the sacrifice, the toil of aspiring humanity, the arati of the Aryan.

The fostering or increasing of man in all his substance and possessions, his continual enlargement towards the fullness and richness of the vast Truth-consciousness, the upholding of him in his great struggle and labour, this is the common preoccupation of the Vedic gods. Then, they are apturah, they who cross the waters, or as Sayana takes it, they who give the waters. This he understands in the sense of “rain-givers” and it is perfectly true that all the Vedic gods are givers of the rain, the abundance (for vrṣṭi, rain, has both senses) of heaven, sometimes described as the solar waters, svavatīr apah, or waters which carry in them the light of the luminous heaven, Svar. But the ocean and the waters in the Veda, as this phrase itself indicates, are the symbol of conscient being in its mass and in its movements. The gods pour the fullness of these waters, especially the upper waters, the waters of heaven, the streams of the Truth, ṛtasya dhārāḥ, across all obstacles into the human consciousness. In this sense they are all apturah. But man is also described as crossing the waters over to his home in the Truth-consciousness and the gods as carrying him over; it is doubtful whether this may not be the
true sense here, especially as we have the two words apturah . . . tūṃhayah close to each other in a connection that may well be significant.

Again the gods are all free from effective assailants, free from the harm of the hurtful or opposing powers and therefore the creative formations of their conscious knowledge, their Maya, move freely, pervasively, attain their right goal, — asridha ebhīmāyāsō adruhah. If we take into account the numerous passages of the Veda which indicate the general object of the sacrifice, of the work, of the journey, of the increase of the light and the abundance of the waters to be the attainment of the Truth-consciousness, Ritam, with the resultant Bliss, Mayas, and that these epithets commonly apply to powers of the infinite, integral Truth-consciousness we can see that it is this attainment of the Truth which is indicated in these three verses. The all-gods increase man, they uphold him in the great work, they bring him the abundance of the waters of Swar, the streams of the Truth, they communicate the unassailably integral and pervading action of the Truth-consciousness with its wide formations of knowledge, māyāḥ.

I have translated the phrase, usrā iva svasarāṇi, in the most external sense possible; but in the Veda even poetical similes are seldom or never employed for mere decoration; they too are utilised to deepen the psychological sense and with a figure of symbolic or double meaning. The word usra is always used in the Veda, like go, with the double sense of the concrete figure or symbol, the Bull or Cow, and at the same time the psychological indication of the bright or luminous ones, the illumined powers of the Truth in man. It is as such illumined powers that the all-gods have to come and they come to the Soma-juice, svasarāṇi, as if to seats or forms of peace or of bliss; for the root svas, like sas and many others, means both to rest and to enjoy. They are the powers of Truth entering into the outpourings of the Ananda in man as soon as that movement has been prepared by the vital and mental activity of the Ashwins and the pure mental activity of Indra.

www.holybooks.com
“O fosterers who uphold the doer in his work, O all-gods, come and divide the Soma-wine that I distribute.

“O all-gods who bring over to us the Waters, come passing through to my Soma-offerings as illumined powers to your places of bliss.

“O all-gods, you who are not assailed nor come to hurt, free-moving in your forms of knowledge, cleave to my sacrifice as its upbearers.”

And, finally, in the last movement of the hymn we have the clear and unmistakable indication of the Truth-consciousness as the goal of the sacrifice, the object of the Soma-offering, the culmination of the work of the Ashwins, Indra and the All-gods in the vitality and in the mind. For these are the three Riks devoted to Saraswati, the divine Word, who represents the stream of inspiration that descends from the Truth-consciousness, and thus limpidly runs their sense:

“May purifying Saraswati with all the plenitude of her forms of plenty, rich in substance by the thought, desire our sacrifice.

“She, the impeller to happy truths, the awakener in consciousness to right mentalisings, Saraswati, upholds the sacrifice.

“Saraswati by the perception awakens in consciousness the great flood (the vast movement of the Ritam) and illumines entirely all the thoughts.”

This clear and luminous finale throws back its light on all that has preceded it. It shows the intimate connection between the Vedic sacrifice and a certain state of mind and soul, the interdependence between the offering of the clarified butter and the Soma juice and luminous thought, richness of psychological content, right states of the mind and its awaking and impulsion to truth and light. It reveals the figure of Saraswati as the goddess of the inspiration, of śruti. And it establishes the connection between the Vedic rivers and psychological states of mind. The passage is one of those luminous hints which the Rishis have left scattered amidst the deliberate ambiguities of their symbolic style to guide us towards their secret.
Chapter IX
Saraswati and Her Consorts

The symbolism of the Veda betrays itself with the greatest clearness in the figure of the goddess Saraswati. In many of the other gods the balance of the internal sense and the external figure is carefully preserved. The veil sometimes becomes transparent or its corners are lifted even for the ordinary hearer of the Word; but it is never entirely removed. One may doubt whether Agni is anything more than the personification of the sacrificial Fire or of the physical principle of Light and Heat in things, or Indra anything more than the god of the sky and the rain or of physical Light, or Vayu anything more than the divinity in the Wind and Air or at most of the physical Life-breath. In the lesser gods the naturalistic interpretation has less ground for confidence; for it is obvious that Varuna is not merely a Vedic Uranus or Neptune, but a god with great and important moral functions; Mitra and Bhaga have the same psychological aspect; the Ribhus who form things by the mind and build up immortality by works can with difficulty be crushed into the Procrustean measure of a naturalistic mythology. Still by imputing a chaotic confusion of ideas to the poets of the Vedic hymns the difficulty can be trampled upon, if not overcome. But Saraswati will submit to no such treatment. She is, plainly and clearly, the goddess of the Word, the goddess of a divine Inspiration.

If that were all, this would not carry us much farther than the obvious fact that the Vedic Rishis were not mere naturalistic barbarians, but had their psychological ideas and were capable of creating mythical symbols which represent not only those obvious operations of physical Nature that interested their agricultural, pastoral and open-air life, but also the inner operations of the mind and soul. If we have to conceive the history of ancient religious thought as a progression from the physical to the
spiritual, from a purely naturalistic to an increasingly ethical and psychological view of Nature and the world and the gods — and this, though by no means certain, is for the present the accepted view,¹ — we must suppose that the Vedic poets were at least already advancing from the physical and naturalistic conception of the Gods to the ethical and the spiritual. But Saraswati is not only the goddess of Inspiration, she is at one and the same time one of the seven rivers of the early Aryan world. The question at once arises, whence came this extraordinary identification? And how does the connection of the two ideas present itself in the Vedic hymns? And there is more; for Saraswati is important not only in herself but by her connections. Before proceeding farther let us cast a rapid and cursory glance at them to see what they can teach us.

The association of a river with the poetical inspiration occurs also in the Greek mythology; but there the Muses are not conceived of as rivers; they are only connected in a not very intelligible fashion with a particular earthly stream. This stream is the river Hippocrene, the fountain of the Horse, and to account for its name we have a legend that it sprang from the hoof of the divine horse Pegasus; for he smote the rock with his hoof and the waters of inspiration gushed out where the mountain had been thus smitten. Was this legend merely a Greek fairy tale or had it any special meaning? And it is evident that if it had any meaning, it must, since it obviously refers to a psychological phenomenon, the birth of the waters of inspiration, have had a psychological meaning; it must have been an attempt to put into concrete figures certain psychological facts. We may note that the word Pegasus, if we transliterate it into the original Aryan phonetics, becomes Pâjasa and is obviously connected with the Sanskrit pâjas, which meant originally force,

¹ I do not think we have any real materials for determining the first origin and primitive history of religious ideas. What the facts really point to is an early teaching at once psychological and naturalistic, that is to say with two faces, of which the first came to be more or less obscured, but never entirely effaced even in the barbarous races, even in races like the tribes of North America. But this teaching, though prehistoric, was anything but primitive.
movement, or sometimes footing. In Greek itself it is connected with pêge, a stream. There is, therefore, in the terms of this legend a constant association with the image of a forceful movement of inspiration. If we turn to Vedic symbols we see that the Ashwa or Horse is an image of the great dynamic force of Life, of the vital and nervous energy, and is constantly coupled with other images that symbolise the consciousness. Adri, the hill or rock, is a symbol of formal existence and especially of the physical nature and it is out of this hill or rock that the herds of the Sun are released and the waters flow. The streams of the madhu, the honey, the Soma, are said also to be milked out of this Hill or Rock. The stroke of the Horse’s hoof on the rock releasing the waters of inspiration would thus become a very obvious psychological image. Nor is there any reason to suppose that the old Greeks and Indians were incapable either of such psychological observation or of putting it into the poetical and mystic imagery which was the very body of the ancient Mysteries.

We might indeed go farther and inquire whether there was not some original connection between the hero Bellerophon, slayer of Bellerus, who rides on the divine Horse, and Indra Valahan, the Vedic slayer of Vala, the enemy who keeps for himself the Light. But this would take us beyond the limits of our subject. Nor does this interpretation of the Pegasus legend carry us any farther than to indicate the natural turn of imagination of the Ancients and the way in which they came to figure the stream of inspiration as an actual stream of flowing water. Saraswati means, “she of the stream, the flowing movement”, and is therefore a natural name both for a river and for the goddess of inspiration. But by what process of thought or association does the general idea of the river of inspiration come to be associated with a particular earthly stream? And in the Veda it is not a question of one river which by its surroundings, natural and legendary, might seem more fitly associated with the idea of sacred inspiration than any other. For here it is a question not of one, but of seven rivers always associated together in the minds of the Rishis and all of them released together by
the stroke of the God Indra when he smote the Python who coiled across their fountains and sealed up their outflow. It seems impossible to suppose that one river only in all this sevenfold outflowing acquired a psychological significance while the rest were associated only with the annual coming of the rains in the Punjab. The psychological significance of Saraswati carries with it a psychological significance for the whole symbol of the Vedic waters.2

Saraswati is not only connected with other rivers but with other goddesses who are plainly psychological symbols and especially with Bharati and Ila. In the later Puranic forms of worship Saraswati is the goddess of speech, of learning and of poetry and Bharati is one of her names, but in the Veda Bharati and Saraswati are different deities. Bharati is also called Mahi, the Large, Great or Vast. The three, Ila, Mahi or Bharati and Saraswati are associated together in a constant formula in those hymns of invocation in which the gods are called by Agni to the Sacrifice.

Iḷā sarasvatī mahī, tisro devīr mayobhuvaḥ;
barhiḥ sidantvasridhah.

“May Ila, Saraswati and Mahi, three goddesses who give birth to the bliss, take their place on the sacrificial seat, they who stumble not,” or “who come not to hurt” or “do no hurt.” The epithet means, I think, they in whom there is no false movement with its evil consequences, duritam, no stumbling into pitfalls of sin and error. The formula is expanded in Hymn 110 of the tenth Mandala:

Ā no yajñāni bhārati tūyam etu,
iḷā manuṣvad iha cetayanti;
Tisro devīr bābhīr edām syonān,
sarasvatī svapasah sadantu.

2 The rivers have a symbolic sense in later Indian thought; as for instance Ganges, Yamuna and Saraswati and their confluence are in the Tantric imagery Yogic symbols, and they are used, though in a different way, in Yogic symbolism generally.
“May Bharati come speeding to our sacrifice and Ila hither awakening our consciousness (or, knowledge or perceptions) in human wise, and Saraswati, — three goddesses sit on this blissful seat, doing well the Work.”

It is clear and will become yet clearer that these three goddesses have closely connected functions akin to the inspirational power of Saraswati. Saraswati is the Word, the inspiration, as I suggest, that comes from the Ritam, the Truth-consciousness. Bharati and Ila must also be different forms of the same Word or knowledge. In the eighth hymn of Madhuchchhandas we have a Rik in which Bharati is mentioned under the name of Mahi.

Evā hyasya sūmrā, virāpsī gomati mahī;
pakvā śākhā na dāsuṇe.

“Thus Mahi for Indra full of the rays, overflowing in her abundance, in her nature a happy truth, becomes as if a ripe branch for the giver of the sacrifice.”

The rays in the Veda are the rays of Surya, the Sun. Are we to suppose that the goddess is a deity of the physical Light or are we to translate “go” by cow and suppose that Mahi is full of cows for the sacrificer? The psychological character of Saraswati comes to our rescue against the last absurd supposition, but it negatives equally the naturalistic interpretation. This characterisation of Mahi, Saraswati’s companion in the sacrifice, the sister of the goddess of inspiration, entirely identified with her in the later mythology, is one proof among a hundred others that light in the Veda is a symbol of knowledge, of spiritual illumination. Surya is the Lord of the supreme Sight, the vast Light, bṛhat jyotih, or, as it is sometimes called, the true Light, r̥tam jyotiḥ. And the connection between the words r̥tam and bṛhat is constant in the Veda.

It seems to me impossible to see in these expressions anything else than the indication of a state of illumined consciousness the nature of which is that it is wide or large, bṛhat, full of the truth of being, satyam, and of the truth of knowledge and action, r̥tam. The gods have this consciousness. Agni, for instance, is termed r̥tacit, he who has the truth-consciousness.
Mahi is full of the rays of this Surya; she carries in her this illumination. Moreover she is *sūṃṭā*, she is the word of a blissful Truth, even as it has been said of Saraswati that she is the impeller of happy truths, *codayitrī sūṃṭānām*. Finally, she is *virapṣī*, large or breaking out into abundance, a word which recalls to us that the Truth is also a Largeness, *ṛtam bṛhat*. And in another hymn, (I.22.10), she is described as *vārūṭrī dhiṣanā*, a widely covering or embracing Thought-power. Mahi, then, is the luminous vastness of the Truth, she represents the Largeness, *bṛhat*, of the superconscient in us containing in itself the Truth, *ṛtam*. She is, therefore, for the sacrificer like a branch covered with ripe fruit.

Ila is also the word of the truth; her name has become identical in a later confusion with the idea of speech. As Saraswati is an awakener of the consciousness to right thinkings or right states of mind, *cetānti sumanām*, so also Ila comes to the sacrifice awakening the consciousness to knowledge, *cetayānti*. She is full of energy, *suvirā*, and brings knowledge. She also is connected with Surya, the Sun, as when Agni, the Will is invoked (V.4.4) to labour by the rays of the Sun, Lord of the true Light, being of one mind with Ila, *ilayā sajoṣā yatamāno raṣmibhiḥ sūryasya*. She is the mother of the Rays, the herds of the Sun. Her name means she who seeks and attains and it contains the same association of ideas as the words Ritam and Rishi. Ila may therefore well be the vision of the seer which attains the truth.

As Saraswati represents the truth-audition, *śrutī*, which gives the inspired word, so Ila represents *drśṭī*, the truth-vision. If so, since *drśṭī* and *śrutī* are the two powers of the Rishi, the Kavi, the Seer of the Truth, we can understand the close connection of Ila and Saraswati. Bharati or Mahi is the largeness of the Truth-consciousness which, dawning on man’s limited mind, brings with it the two sister Puissances. We can also understand how these fine and living distinctions came afterwards to be neglected as the Vedic knowledge declined and Bharati, Saraswati, Ila melted into one.

We may note also that these three goddesses are said to
bring to birth for man the Bliss, Mayas. I have already insisted on the constant relation, as conceived by the Vedic seers, between the Truth and the Bliss or Ananda. It is by the dawning of the true or infinite consciousness in man that he arrives out of this evil dream of pain and suffering, this divided creation into the Bliss, the happy state variously described in Veda by the words bhadram, mayas (love and bliss), svasti (the good state of existence, right being) and by others less technically used such as váryam, rayih, ráyah. For the Vedic Rishi Truth is the passage and the antechamber, the Bliss of the divine existence is the goal, or else Truth is the foundation, Bliss the supreme result.

Such, then, is the character of Saraswati as a psychological principle, her peculiar function and her relation to her most immediate connections among the gods. How far do these shed any light on her relations as the Vedic river to her six sister streams? The number seven plays an exceedingly important part in the Vedic system, as in most very ancient schools of thought. We find it recurring constantly,—the seven delights, sapta ratnāṃ; the seven flames, tongues or rays of Agni, sapta arcīṣāḥ, sapta jvālāḥ; the seven forms of the Thought-principle, sapta dhītāyah; the seven Rays or Cows, forms of the Cow unslayable, Aditi, mother of the gods, sapta gāvah; the seven rivers, the seven mothers or fostering cows, sapta mātarah, sapta dhenaḥah, a term applied indifferently to the Rays and to the Rivers. All these sets of seven depend, it seems to me, upon the Vedic classification of the fundamental principles, the tattvas, of existence. The enquiry into the number of these tattvas greatly interested the speculative mind of the ancients and in Indian philosophy we find various answers ranging from the One upward and running into the twenties. In Vedic thought the basis chosen was the number of the psychological principles, because all existence was conceived by the Rishis as a movement of conscious being. However merely curious or barren these speculations and classifications may seem to the modern mind, they were no mere dry metaphysical distinctions, but closely connected with a living psychological practice of which they were to a great extent the thought-basis, and in any case we must understand them clearly
if we wish to form with any accuracy an idea of this ancient and far-off system.

In the Veda, then, we find the number of the principles variously stated. The One was recognised as the basis and continent; in this One there were the two principles divine and human, mortal and immortal. The dual number is also otherwise applied in the two principles, Heaven and Earth, Mind and Body, Soul and Nature, who are regarded as the father and mother of all beings. It is significant, however, that Heaven and Earth, when they symbolise two forms of natural energy, the mental and the physical consciousness, are no longer the father and mother, but the two mothers. The triple principle was doubly recognised, first in the threefold divine principle answering to the later Sachchidananda, the divine existence, consciousness and bliss, and secondly in the threefold mundane principle, Mind, Life, Body, upon which is built the triple world of the Veda and Puranas. But the full number ordinarily recognised is seven. This figure was arrived at by adding the three divine principles to the three mundane and interpolating a seventh or link-principle which is precisely that of the Truth-consciousness, Ritam Brihat, afterwards known as Vijnana or Mahas. The latter term means the Large and is therefore an equivalent of Brihat. There are other classifications of five, eight, nine and ten and even, as it would seem, twelve; but these do not immediately concern us.

All these principles, be it noted, are supposed to be really inseparable and omnipresent and therefore apply themselves to each separate formation of Nature. The seven Thoughts, for instance, are Mind applying itself to each of the seven planes as we would now call them and formulating Matter-mind, if we may so call it, nervous mind, pure mind, truth-mind and so on to the highest summit, paramārāvat. The seven rays or cows are Aditi the infinite Mother, the Cow unslayable, supreme Nature or infinite Consciousness, pristine source of the later idea of Prakriti or Shakti, — the Purusha is in this early pastoral imagery the Bull, Vrishabha, — the Mother of things taking form on the seven planes of her world-action as energy of conscious being. So also, the seven rivers are conscious currents corresponding to
the sevenfold substance of the ocean of being which appears to us formulated in the seven worlds enumerated by the Puranas. It is their full flow in the human consciousness which constitutes the entire activity of the being, his full treasure of substance, his full play of energy. In the Vedic image, his cows drink of the water of the seven rivers.

Should this imagery be admitted, and it is evident that if once such conceptions are supposed to exist, this would be the natural imagery for a people living the life and placed in the surroundings of the ancient Aryans,—quite as natural for them and inevitable as for us the image of the “planes” with which theosophical thought has familiarised us,—the place of Saraswati as one of the seven rivers becomes clear. She is the current which comes from the Truth-principle, from the Ritam or Mahas, and we actually find this principle spoken of in the Veda,—in the closing passage of our third hymn for instance,—as the Great Water, maho arṇas,—an expression which gives us at once the origin of the later term, Mahas,—or sometimes mahan arṇavah. We see in the third hymn the close connection between Saraswati and this great water. Let us examine a little more closely this connection before we proceed to the consideration of the Vedic cows and their relation to the god Indra and Saraswati’s close cousin the goddess Sarama. For it is necessary to define these relations before we can progress with the scrutiny of Madhuchchhandas’ other hymns addressed without exception to the great Vedic deity, King of Heaven, who, according to our hypothesis, symbolises the Power of Mind and especially the divine or self-luminous Mind in the human being.
The Image of the Oceans and the Rivers

THE THREE riks of the third hymn of Madhuchchhandas in which Saraswati has been invoked, run as follows, in the Sanskrit: —

Pāvakā naḥ sarasvatī, vājebhir vājinīvatī;  
yajñaṁ vaṣṭu dhiyāvasuḥ.  
Codayitri sūrṭānāṁ, cetantī sumatināṁ;  
yajñaṁ dadhe sarasvatī.  
Maho arṇaḥ sarasvatī, pra cetayati ketunā;  
dhiyo viśvā vi rājati.

The sense of the first two verses is clear enough when we know Saraswati to be that power of the Truth which we call inspiration. Inspiration from the Truth purifies by getting rid of all falsehood, for all sin according to the Indian idea is merely falsehood, wrongly inspired emotion, wrongly directed will and action. The central idea of life and ourselves from which we start is a falsehood and all else is falsified by it. Truth comes to us as a light, a voice, compelling a change of thought, imposing a new discernment of ourselves and all around us. Truth of thought creates truth of vision and truth of vision forms in us truth of being, and out of truth of being (satyam) flows naturally truth of emotion, will and action. This is indeed the central notion of the Veda.

Saraswati, the inspiration, is full of her luminous plenitudes, rich in substance of thought. She upholds the Sacrifice, the offering of the mortal being’s activities to the divine by awakening his consciousness so that it assumes right states of emotion and right movements of thought in accordance with the Truth from which she pours her illuminations and by impelling in it the rise
of those truths which, according to the Vedic Rishis, liberate the life and being from falsehood, weakness and limitation and open to it the doors of the supreme felicity.

By this constant awakening and impulsion, summed up in the word, perception, ketu, often called the divine perception, daivya ketu, to distinguish it from the false mortal vision of things,—Saraswati brings into active consciousness in the human being the great flood or great movement, the Truth-consciousness itself, and illumines with it all our thoughts. We must remember that this truth-consciousness of the Vedic Rishis is a supra-mental plane, a level of the hill of being (adreśā sāṇu) which is beyond our ordinary reach and to which we have to climb with difficulty. It is not part of our waking being, it is hidden from us in the sleep of the superconscient. We can then understand what Madhuchchhandas means when he says that Saraswati by the constant action of the inspiration awakens the Truth to consciousness in our thoughts.

But this line may, so far as the mere grammatical form of it goes, be quite otherwise translated; we may take maho arṇas in apposition to Saraswati and render the verse “Saraswati, the great river, awakens us to knowledge by the perception and shines in all our thoughts.” If we understand by this expression, “the great river”, as Sayana seems to understand, the physical river in the Punjab, we get an incoherence of thought and expression which is impossible except in a nightmare or a lunatic asylum. But it is possible to suppose that it means the great flood of inspiration and that there is no reference to the great ocean of the Truth-Consciousness. Elsewhere, however, there is repeated reference to the gods working by the vast power of the great flood (mahṇā mahato arṇavaṣya) where there is no reference to Saraswati and it is improbable that she should be meant. It is true that in the Vedic writings Saraswati is spoken of as the secret self of Indra,—an expression, we may observe, that is void of sense if Saraswati is only a northern river and Indra the god of the sky, but has a very profound and striking significance if Indra be the illumined Mind and Saraswati the inspiration that proceeds from the hidden plane of the supra-
mental Truth. But it is impossible to give Saraswati so important a place with regard to the other gods as would be implied by interpreting the phrase mahā mahato arṇavasya in the sense “by the greatness of Saraswati”. The gods act, it is continually stated, by the power of the Truth, rūna, but Saraswati is only one of the deities of the Truth and not even the most important or universal of them. The sense I have given is, therefore, the only rendering consistent with the general thought of the Veda and with the use of the phrase in other passages.

Let us then start from this decisive fact put beyond doubt by this passage — whether we take the great stream to be Saraswati itself or the Truth-ocean — that the Vedic Rishis used the image of water, a river or an ocean, in a figurative sense and as a psychological symbol, and let us see how far it takes us. We notice first that existence itself is constantly spoken of in the Hindu writings, in Veda, Purana and even philosophical reasoning and illustration as an ocean. The Veda speaks of two oceans, the upper and the lower waters. These are the ocean of the subconscient, dark and inexpressive, and the ocean of the superconscient, luminous and eternal expression but beyond the human mind. Vamadeva in the last hymn of the fourth Mandala speaks of these two oceans. He says that a honeyed wave climbs up from the ocean and by means of this mounting wave which is the Soma (aṃśu) one attains entirely to immortality; that wave or that Soma is the secret name of the clarity (ghṛtasya, the symbol of the clarified butter); it is the tongue of the gods; it is the nodus (nābhi) of immortality.

Samudrād urvīr madhumān udārad,  
upāṃśunā sam amṛtatvam ānaṭ;  
Ghṛtasya nāma guhyam yad asti,  
jihvā devānām amṛtasya nābhiḥ.

I presume there can be no doubt that the sea, the honey, the Soma, the clarified butter are in this passage at least psychological symbols. Certainly, Vamadeva does not mean that a wave or flood of wine came mounting up out of the salt water of the Indian Ocean or of the Bay of Bengal or even from the fresh
The Image of the Oceans and the Rivers

water of the river Indus or the Ganges and that this wine is a secret name for clarified butter. What he means to say is clearly that out of the subconscious depths in us arises a honeyed wave of Ananda or pure delight of existence, that it is by this Ananda that we can arrive at immortality; this Ananda is the secret being, the secret reality behind the action of the mind in its shining clarities. Soma, the god of the Ananda, the Vedanta also tells us, is that which has become mind or sensational perception; in other words, all mental sensation carries in it a hidden delight of existence and strives to express that secret of its own being. Therefore Ananda is the tongue of the gods with which they taste the delight of existence; it is the nodus in which all the activities of the immortal state or divine existence are bound together. Vamadeva goes on to say, “Let us give expression to this secret name of the clarity, — that is to say, let us bring out this Soma wine, this hidden delight of existence; let us hold it in this world-sacrifice by our surrenderings or submissions to Agni, the divine Will or Conscious-Power which is the Master of being. He is the four-horned Bull of the worlds and when he listens to the soul-thought of man in its self-expression, he ejects this secret name of delight from its hiding-place.”

Vayam nama pra bravam ghratasya,
asmin yajne dharyamnam namobhib;
Upa brahma srnavac chasyamanam,
catuhsrigo avamid gaura etat.

Let us note, in passing, that since the wine and the clarified butter are symbolic, the sacrifice also must be symbolic. In such hymns as this of Vamadeva’s the ritualistic veil so elaborately woven by the Vedic mystics vanishes like a dissolving mist before our eyes and there emerges the Vedantic truth, the secret of the Veda.

Vamadeva leaves us in no doubt as to the nature of the Ocean of which he speaks; for in the fifth verse he openly describes it as the ocean of the heart, hrdayat samudrāt, out of which rise the waters of the clarity, ghratasya dhārāḥ; they flow, he says, becoming progressively purified by the mind and the inner heart, antar hrdaya manasa puyamanāḥ. And in the closing
verse he speaks of the whole of existence being triply established, first in the seat of Agni — which we know from other riks to be the Truth-Consciousness, Agni’s own home, svam damam rtaṃ brhat, — secondly, in the heart, the sea, which is evidently the same as the heart-ocean, — thirdly, in the life of man.

Dhāman te viśvam bhuvanam abhi śritam, antah samudre hṛdyantar āyuśi.

The superconscient, the sea of the subconscient, the life of the living being between the two, — this is the Vedic idea of existence.

The sea of the superconscient is the goal of the rivers of clarity, of the honeyed wave, as the sea of the subconscient in the heart within is their place of rising. This upper sea is spoken of as the Sindhu, a word which may mean either river or ocean; but in this hymn it clearly means ocean. Let us observe the remarkable language in which Vamadeva speaks of these rivers of the clarity. He says first that the gods sought and found the clarity, the gṛtāṃ, triply placed and hidden by the Panis in the cow, gavi. It is beyond doubt that go is used in the Veda in the double sense of Cow and Light; the Cow is the outer symbol, the inner meaning is the Light. The figure of the cows stolen and hidden by the Panis is constant in the Veda. Here it is evident that as the sea is a psychological symbol — the heart-ocean, samudre hṛdi, — and the Soma is a psychological symbol and the clarified butter is a psychological symbol, the cow in which the gods find the clarified butter hidden by the Panis must also symbolise an inner illumination and not physical light. The cow is really Aditi, the infinite consciousness hidden in the subconscient, and the triple gṛtāṃ is the triple clarity of the liberated sensation finding its secret of delight, of the thought-mind attaining to light and intuition and of the truth itself, the ultimate supra-mental vision. This is clear from the second half of the verse in which it is said, “One Indra produced, one Surya, one the gods fashioned by natural development out of Vena”; for Indra is the Master of the thought-mind, Surya of the supra-mental light, Vena is Soma, the master of mental delight of existence, creator of the sense-mind.
We may observe also in passing that the Panis here must perforce be spiritual enemies, powers of darkness, and not Dravidian gods or Dravidian tribes or Dravidian merchants. In the next verse Vamadeva says of the streams of the ghṛtam that they move from the heart-ocean shut up in a hundred prisons (pens) by the enemy so that they are not seen. Certainly, this does not mean that rivers of ghee — or of water, either — rising from the heart-ocean or any ocean were caught on their way by the wicked and unconscionable Dravidians and shut up in a hundred pens so that the Aryans or the Aryan gods could not even catch a glimpse of them. We perceive at once that the enemy, Pani, Vritra of the hymns is a purely psychological conception and not an attempt of our forefathers to conceal the facts of early Indian history from their posterity in a cloud of tangled and inextricable myths. The Rishi Vamadeva would have stood aghast at such an unforeseen travesty of his ritual images. We are not even helped if we take ghṛta in the sense of water, hr̥dyā samudra in the sense of a delightful lake, and suppose that the Dravidians enclose the water of the rivers with a hundred dams so that the Aryans could not even get a glimpse of them. For even if the rivers of the Punjab all flow out of one heart-pleasing lake, yet their streams of water cannot even so have been triply placed in a cow and the cow hidden in a cave by the cleverest and most inventive Dravidians.

“These move” says Vamadeva “from the heart-ocean; penned by the enemy in a hundred enclosures they cannot be seen; I look towards the streams of the clarity, for in their midst is the Golden Reed. Entirely they stream like flowing rivers becoming purified by the heart within and the mind; these move, waves of the clarity, like animals under the mastery of their driver. As if on a path in front of the Ocean (sindhu, the upper ocean) the mighty ones move compact of forceful speed but limited by the vital force (vāta, vāyu), the streams of clarity; they are like a straining horse which breaks its limits, as it is nourished by the waves.” On the very face of it this is the poetry of a mystic concealing his sense from the profane under a veil of images which occasionally he suffers to grow

www.holybooks.com
transparent to the eye that chooses to see. What he means is that the divine knowledge is all the time flowing constantly behind our thoughts, but is kept from us by the internal enemies who limit our material of mind to the sense-action and sense-perception so that though the waves of our being beat on banks that border upon the superconscient, the infinite, they are limited by the nervous action of the sense-mind and cannot reveal their secret. They are like horses controlled and reined in; only when the waves of the light have nourished their strength to the full does the straining steed break these limits and they flow freely towards That from which the Soma-wine is pressed out and the sacrifice is born.

\[ Yatra somah sūyate yatra yajña, \]
\[ ghṛtasya dhārā abhi tat pavante. \]

This goal is, again, explained to be that which is all honey, — ghṛtasya dhārā madhumat pavante; it is the Ananda, the divine Beatitude. And that this goal is the Sindhu, the superconscient ocean, is made clear in the last rik, where Vamadeva says, “May we taste that honeyed wave of thine” — of Agni, the divine Purusha, the four-horned Bull of the worlds — “which is borne in the force of the Waters where they come together.”

\[ Apām anike samithe ya ābhṛtas, \]
\[ tam aśyāma madhumantam ta úrmim. \]

We find this fundamental idea of the Vedic Rishis brought out in the Hymn of Creation (X.129) where the subconscient is thus described. “Darkness hidden by darkness in the beginning was this all, an ocean without mental consciousness . . . out of it the One was born by the greatness of Its energy. It first moved in it as desire which was the first seed of mind. The Masters of Wisdom found out in the non-existent that which builds up the existent; in the heart they found it by purposeful impulsion and by the thought-mind. Their ray was extended horizontally; there was something above, there was something below.” In this passage the same ideas are brought out as in Vamadeva’s hymn but without the veil of images. Out of the subconscient ocean
the One arises in the heart first as desire; he moves there in the heart-ocean as an unexpressed desire of the delight of existence and this desire is the first seed of what afterwards appears as the sense-mind. The gods thus find out a means of building up the existent, the conscious being, out of the subconscious darkness; they find it in the heart and bring it out by the growth of thought and purposeful impulsion, pratiṣṭyā, by which is meant mental desire as distinguished from the first vague desire that arises out of the subconscious in the merely vital movements of nature. The conscious existence which they thus create is stretched out as it were horizontally between two other extensions; below is the dark sleep of the subconscious, above is the luminous secrecy of the superconscious. These are the upper and the lower ocean.

This Vedic imagery throws a clear light on the similar symbolic images of the Puranas, especially on the famous symbol of Vishnu sleeping after the pralaya on the folds of the snake Ananta upon the ocean of sweet milk. It may perhaps be objected that the Puranas were written by superstitious Hindu priests or poets who believed that eclipses were caused by a dragon eating the sun and moon and could easily believe that during the periods of non-creation the supreme Deity in a physical body went to sleep on a physical snake upon a material ocean of real milk and that therefore it is a vain ingenuity to seek for a spiritual meaning in these fables. My reply would be that there is in fact no need to seek for such meanings; for these very superstitious poets have put them there plainly on the very surface of the fable for everybody to see who does not choose to be blind. For they have given a name to Vishnu’s snake, the name Ananta, and Ananta means the Infinite; therefore they have told us plainly enough that the image is an allegory and that Vishnu, the all-pervading Deity, sleeps in the periods of non-creation on the coils of the Infinite. As for the ocean, the Vedic imagery shows us that it must be the ocean of eternal existence and this ocean of eternal existence is an ocean of absolute sweetness, in other words, of pure Bliss. For the sweet milk (itself a Vedic image) has, evidently, a sense not essentially different from the madhū, honey or sweetness, of Vamadeva’s hymn.
Thus we find that both Veda and Purana use the same symbolic images; the ocean is for them the image of infinite and eternal existence. We find also that the image of the river or flowing current is used to symbolise a stream of conscious being. We find that Saraswati, one of the seven rivers, is the river of inspiration flowing from the Truth-consciousness. We have the right then to suppose that the other six rivers are also psychological symbols.

But we need not depend entirely on hypothesis and inference, however strong and entirely convincing. As in the hymn of Vamadeva we have seen that the rivers, ghṛtasya dhārāḥ, are there not rivers of clarified butter or rivers of physical water, but psychological symbols, so we find in other hymns the same compelling evidence as to the image of the seven rivers. For this purpose I will examine one more hymn, the first Sukta of the third Mandala sung by the Rishi Vishwamitra to the god Agni; for here he speaks of the seven rivers in language as remarkable and unmistakable as the language of Vamadeva about the rivers of clarity. We shall find precisely the same ideas recurring in quite different contexts in the chants of these two sacred singers.
Chapter XI

The Seven Rivers

The VEDA speaks constantly of the waters or the rivers, especially of the divine waters, āpo deviḥ or āpo divyāḥ, and occasionally of the waters which carry in them the light of the luminous solar world or the light of the Sun, svarvatīr apah. The passage of the waters effected by the Gods or by man with the aid of the Gods is a constant symbol. The three great conquests to which the human being aspires, which the Gods are in constant battle with the Vritras and Panis to give to man are the herds, the waters and the Sun or the solar world, gā apah svah. The question is whether these references are to the rains of heaven, the rivers of Northern India possessed or assailed by the Dravidians — the Vritras being sometimes the Dravidians and sometimes their gods, the herds possessed or robbed from the Aryan settlers by the indigenous “robbers” — the Panis who hold or steal the herds being again sometimes the Dravidians and sometimes their gods; or is there a deeper, a spiritual meaning? Is the winning of Swar simply the recovery of the sun from its shadowing by the storm-cloud or its seizure by eclipse or its concealment by the darkness of Night? For here at least there can be no withholding of the sun from the Aryans by human “black-skinned” and “noseless” enemies. Or does the conquest of Swar mean simply the winning of heaven by sacrifice? And in either case what is the sense of this curious collocation of cows, waters and the sun or cows, waters and the sky? Is it not rather a system of symbolic meanings in which the herds, indicated by the word gāh in the sense both of cows and rays of light, are the illuminations from the higher consciousness which have their origin in the Sun of Light, the Sun of Truth? Is not Swar itself the world or plane of immortality governed by that Light or Truth of the all-illumining Sun called in Veda the vast Truth, rtaḥ brhat, and the true Light? and are not the divine waters, āpo deviḥ, divyāḥ
or \textit{svarvatih}, the floods of this higher consciousness pouring on the mortal mind from that plane of immortality?

It is, no doubt, easy to point to passages or hymns in which on the surface there seems to be no need of any such interpretation and the \textit{s\text{"u}kta} can be understood as a prayer or praise for the giving of rain or an account of a battle on the rivers of the Punjab. But the Veda cannot be interpreted by separate passages or hymns. If it is to have any coherent or consistent meaning, we must interpret it as a whole. We may escape our difficulties by assigning to \textit{svar} or \textit{gah} entirely different senses in different passages — just as Sayana sometimes finds in \textit{gah} the sense of cows, sometimes rays and sometimes, with an admirable light-heartedness, compels it to mean waters.\footnote{So also he interprets the all-important Vedic word \textit{r$tam} sometimes as sacrifice, sometimes as truth, sometimes as water, and all these different senses in a single hymn of five or six verses!} But such a system of interpretation is not rational merely because it leads to a “rationalistic” or “common-sense” result. It rather flouts both reason and common sense. We can indeed arrive by it at any result we please, but no reasonable and unbiassed mind can feel convinced that that result was the original sense of the Vedic hymns.

But if we adopt a more consistent method, insuperable difficulties oppose themselves to the purely material sense. We have for instance a hymn (VII.49) of Vasishtha to the divine waters, \textit{\text{"a}po dev\text{"i}h, \text{"a}po \textit{divy\text{"a}h}}, in which the second verse runs, “The divine waters that flow whether in channels dug or self-born, they whose movement is towards the ocean, pure, purifying, — may those waters foster me.” Here, it will be said, the sense is quite clear; it is to material waters, earthly rivers, canals, — or, if the word \textit{khanitr\text{"i}m\text{"a}h} means simply “dug”, then wells, — that Vasishtha addresses his hymn and \textit{\text{"a}po \textit{divy\text{"a}h}}, divine, is only an ornamental epithet of praise; or even perhaps we may render the verse differently and suppose that three kinds of water are described, — the waters of heaven, that is to say the rain, the water of wells, the water of rivers. But when we study the hymn as a whole this sense can no longer stand. For thus it runs:
“May those divine waters foster me, the eldest (or greatest) of the ocean from the midst of the moving flood that go purifying, not settling down, which Indra of the thunderbolt, the Bull, clove out. The divine waters that flow whether in channels dug or self-born, whose movement is towards the Ocean,—may those divine waters foster me. In the midst of whom King Varuna moves looking down on the truth and the falsehood of creatures, they that stream honey and are pure and purifying,—may those divine waters foster me. In whom Varuna the king, in whom Soma, in whom all the Gods have the intoxication of the energy, into whom Agni Vaishwanara has entered, may those divine waters foster me.”

It is evident that Vasishtha is speaking here of the same waters, the same streams that Vamadeva hymns, the waters that rise from the ocean and flow into the ocean, the honeyed wave that rises upward from the sea, from the flood that is the heart of things, streams of the clarity, *ghṛtasya dhārāḥ*. They are the floods of the supreme and universal conscious existence in which Varuna moves looking down on the truth and the falsehood of mortals,—a phrase that can apply neither to the descending rains nor to the physical ocean. Varuna in the Veda is not an Indian Neptune, neither is he precisely, as the European scholars at first imagined, the Greek Ouranos, the sky. He is the master of an ethereal wideness, an upper ocean, of the vastness of being, of its purity; in that vastness, it is elsewhere said, he has made paths in the pathless infinite along which Surya, the Sun, the Lord of Truth and the Light can move. Thence he looks down on the mingled truths and falsehoods of the mortal consciousness. And we have farther to note that these divine waters are those which Indra has cloven out and made to flow upon the earth,—a description which throughout the Veda is applied to the seven rivers.

If there were any doubt whether these waters of Vasishtha’s prayer are the same as the waters of Vamadeva’s great hymn, *madhvān īrmih, ghṛtasya dhārāḥ*, it is entirely removed by another Sukta of the sage Vasishtha, (VII.47). In the forty-ninth hymn he refers briefly to the divine waters as honey-streaming,
madhuścutah and speaks of the Gods enjoying in them the intoxication of the energy, īrjāṁ madanti; from this we can gather that the honey or sweetness is the madhu, the Soma, the wine of the Ananda, of which the Gods have the ecstasy. But in the forty-seventh hymn he makes his meaning unmistakably clear.

“O Waters, that supreme wave of yours, the drink of Indra, which the seekers of the Godhead have made for themselves, that pure, inviolate, clarity-streaming, honeyed (ghṛtapruśam madhumāntam) wave of you may we today enjoy. O Waters, may the son of the waters (Agni), he of the swift rushings, foster that most honeyed wave of you; that wave of yours in which Indra with the Vasus is intoxicated with ecstasy, may we who seek the Godhead taste today. Strained through the hundred purifiers, ecstatic by their self-nature, they are divine and move to the goal of the movement of the Gods (the supreme ocean); they limit not the workings of Indra: offer to the rivers a food of oblation full of the clarity (ghṛtavat). May the rivers which the sun has formed by his rays, from whom Indra clove out a moving wave, establish for us the supreme good. And do ye, O gods, protect us ever by states of felicity.”

Here we have Vamadeva’s madhumān īrmīḥ, the sweet intoxicating wave, and it is plainly said that this honey, this sweetness is the Soma, the drink of Indra. That is farther made clear by the epithet śatapavitráḥ which can only refer in the Vedic language to the Soma; and let us note that it is an epithet of the rivers themselves and that the honeyed wave is brought flowing from them by Indra, its passage being cloven out on the mountains by the thunderbolt that slew Vritra. Again it is made clear that these waters are the seven rivers released by Indra from the hold of Vritra, the Besieger, the Coverer and sent flowing down upon the earth.

What can these rivers be whose wave is full of Soma wine, full of the ghṛta, full of īrj, the energy? What are these waters that flow to the goal of the gods’ movement, that establish for man the supreme good? Not the rivers of the Punjab; no wildest assumption of barbarous confusion or insane incoherence in the mentality of the Vedic Rishis can induce us to put such a
construction upon such expressions. Obviously these are the waters of the Truth and the Bliss that flow from the supreme ocean. These rivers flow not upon earth, but in heaven; they are prevented by Vritra the Besieger, the Coverer from flowing down upon the earth-consciousness in which we mortals live till Indra, the god-mind, smites the Coverer with his flashing lightnings and cuts out a passage on the summits of that earth-consciousness down which they can flow. Such is the only rational, coherent and sensible explanation of the thought and language of the Vedic sages. For the rest, Vasishtha makes it clear enough to us; for he says that these are the waters which Surya has formed by his rays and which, unlike earthly movements, do not limit or diminish the workings of Indra, the supreme Mind. They are, in other words, the waters of the Vast Truth, \( \text{r.tam bh} \) and, as we have always seen that this Truth creates the Bliss, so here we find that these waters of the Truth, \( \text{r.tasya dh} \), as they are plainly called in other hymns (e.g. V.12.2, “O perceiver of the Truth, perceive the Truth alone, cleave out many streams of the Truth”), establish for men the supreme good and the supreme good is the felicity, the bliss of the divine existence.

Still, neither in these hymns nor in Vamadeva’s is there an express mention of the seven rivers. We will turn therefore to the first hymn of Vishwamitra, his hymn to Agni, from its second to its fourteenth verse. The passage is a long one, but it is sufficiently important to cite and translate in full.

2. \( \text{Prāñcam yajñam cakrma vardhatāṁ gīh,} \\
    \text{samidbir agnim namasā duvasyan;} \\
    \text{Divah śaśāsur vidathā kavināṁ,} \\
    \text{grtśaya cit tavase gātum iṣuh.} \)

3. \( \text{Mayo dadhe medhirah pūtadakśo,} \\
    \text{divah subandhir januśa prthivyāḥ;} \\
    \text{Avindan nu darśatam apsvantar,} \\
    \text{devāso agnim apasi svasṛṇām.} \)

\[ \text{The word indeed is usually understood as “felicity”}. \]
4. Avardhayan subhagam sapta yahvih, 
śvetam jajñānam aruṣan mahitvā; 
Śīṣuṁ na jātām abhyārur āśvā, 
devaso agnim janiman vapusyan.

5. Śukrebhir angai raja ātatanvān, 
kratum punañah kavibhiḥ pavitraḥ; 
Śocir vasānah pari āyur apām, 
śriyo mimitre brhatir anūnah.

6. Vavrāja sim anadatir adabdha, 
divo yahvīr avasānā anagnāḥ; 
Sanā athra yuvatayaḥ sayonir, 
ekaṃ garbham dadhīre sapta vānīḥ.

7. Stīrṇā asya sambato visvarūpā, 
gṛtasya yonau srawate madhūnām; 
Asthur athra dhenavah pīvanānā, 
mahi dasmasya mātarā samīcī.

8. Babhrānāḥ sino sahaso vyadyaud, 
dadhānah sukra rabhasā vāpūṣṇi; 
Śocantī dhārā madhuno gṛtasya, 
vṛśa yatra vārdeḥ kāryena.

9. Pitus cīd ādhur januṣa viveda, 
vyasya dhārā astjād vi dhenāḥ; 
Guhā carantām sakhibhiḥ śivebhir, 
divo yahvibhir na guhā babhūva.

10. Pitus ca garbham janitus ca babhre, 
pūrvir eko adhayat pīpyānāḥ; 
Vṛṣṇe sapatnī śucaye sabandhā, 
ubhe asmai manusya ni pāhi.

11. Urau mahān anibādhe vavardha, 
āpo agnim yasaśah sam hi pūrvih; 
Rtasya yonāv asayad damūnā, 
jāminām agnir apasi vasaṇām.

12. Akro na babhriḥ samitthe mabīnān, 
didṛkṣeyah sūnave bhā-ṛjikāḥ; 
Ud usriyā janitā yo jajāna, 
apām garbhō nṛtamo yahvo agnih.
13. Apāṁ garbhaṁ drśatam oṣadhināṁ, 
vanā jajāna subhagā virūpam;
Devāsaś cin manasā saṁ hi jagmuḥ,
paniṣṭham jātaṁ tavasaṁ dvāsyan.

14. Bṛhanta id bhānava bhā-ṛjikam, 
agniṁ sacanta vidyuto na śukrāḥ;
Guḥeva vṛddhaṁ sadasi sve antar, 
apāra īrve amṛtaṁ duhānāḥ.

“We have made the sacrifice to ascend towards the supreme, 
let the Word increase. With kindlings of his fire, with obeisance 
of submission they set Agni to his workings; they have given ex-
pression in the heaven to the knowings of the seers and they de-
sire a passage for him in his strength, in his desire of the word. (2)
“Full of intellect, purified in discernment, the perfect friend 
(or, perfect builder) from his birth of Heaven and of Earth, 
he establishes the Bliss; the gods discovered Agni visible in the 
Waters, in the working of the sisters. (3)
“The seven Mighty Ones increased him who utterly enjoys 
felicity, white in his birth, ruddy when he has grown. They 
moved and laboured about him, the Mares around the newborn 
child; the gods gave body to Agni in his birth. (4)
“With his pure bright limbs he extended and formed the 
middle world purifying the will-to-action by the help of the 
pure lords of wisdom; wearing light as a robe about all the life 
of the Waters he formed in himself glories vast and without any 
deficiency. (5)
“He moved everywhere about the Mighty Ones of Heaven, 
and they devoured not, neither were overcome,—they were 
not clothed, neither were they naked. Here the eternal and ever 
young goddesses from one womb held the one Child, they the 
Seven Words. (6)
“Spread out were the masses of him in universal forms in the 
womb of the clarity, in the flowings of the sweetineses; here the 
fostering Rivers stood nourishing themselves; the two Mothers 
of the accomplishing god became vast and harmonised. (7)
“Borne by them, O child of Force, thou didst blaze out
holding thy bright and rapturous embodiments; out flow the streams of the sweetness, the clarity, where the Bull of the abundance has grown by the Wisdom. (8)

“He discovered at his birth the source of the abundance of the Father and he loosed forth wide His streams and wide His rivers. By his helpful comrades and by the Mighty Ones of Heaven he found Him moving in the secret places of existence, yet himself was not lost in their secrecy. (9)

“He bore the child of the Father and of him that begot him; one, he fed upon his many mothers in their increasing. In this pure Male both these powers in man (Earth and Heaven) have their common lord and lover; do thou guard them both. (10)

“Great in the unobstructed Vast he increased; yea, many Waters victoriously increased Agni. In the source of the Truth he lay down; there he made his home, Agni in the working of the undivided Sisters. (11)

“As the mover in things and as their sustainer he in the meeting of the Great Ones, seeking vision, straight in his lustres for the presser-out of the Soma wine, he who was the father of the Radiances, gave them now their higher birth, — the child of the Waters, the mighty and most strong Agni. (12)

“To the visible Birth of the waters and of the growths of Earth the goddess of Delight now gave birth in many forms, she of the utter felicity. The gods united in him by the mind and they set him to his working who was born full of strength and mighty for the labour. (13)

“Those vast shinings clove to Agni straight in his lustre and were like bright lightnings; from him increasing in the secret places of existence in his own seat within the shoreless Vast they milked out Immortality.” (14)

Whatever may be the meaning of this passage, — and it is absolutely clear that it has a mystic significance and is no mere sacrificial hymn of ritualistic barbarians, — the seven rivers, the waters, the seven sisters cannot here be the seven rivers of the Punjab. The waters in which the gods discovered the visible Agni cannot be terrestrial and material streams; this Agni who
increases by knowledge and makes his home and rest in the
source of the Truth, of whom Heaven and Earth are the wives
and lovers, who is increased by the divine waters in the unob-
structed Vast, his own seat, and dwelling in that shoreless infinity
yields to the illumined gods the supreme Immortality, cannot be
the god of physical Fire. In this passage as in so many others the
mystical, the spiritual, the psychological character of the burden
of the Veda reveals itself not under the surface, not behind a veil
of mere ritualism, but openly, insistently,—in a disguise indeed,
but a disguise that is transparent, so that the secret truth of
the Veda appears here, like the rivers of Vishwamitra's hymn,
“neither veiled nor naked”.

We see that these Waters are the same as those of Vamadeva's
hymn, of Vasishtha's, closely connected with the clarity and the
honey,—gdtya yonau sravathe madhinam, scotanti dhara
madhuno gdrasya; they lead to the Truth, they are themselves
the source of the Truth, they flow in the unobstructed and shore-
less Vast as well as here upon the earth. They are figured as
fostering cows (dhenavah), mares (asvah), they are called sapta
vanih, the seven Words of the creative goddess Vak,—Speech,
the expressive power of Aditi, of the supreme Prakriti who is
spoken of as the Cow just as the Deva or Purusha is described in
the Veda as Vrishabha or Vrishan, the Bull. They are therefore
the seven strands of all being, the seven streams or currents or
forms of movement of the one conscious existence.

We shall find that in the light of the ideas which we have
discovered from the very opening of the Veda in Madhuch-
chhandas' hymns and in the light of the symbolic interpretations
which are now becoming clear to us, this passage apparently so
figured, mysterious, enigmatical becomes perfectly straightfor-
ward and coherent, as indeed do all the passages of the Veda
which seem now almost unintelligible when once their right clue
is found. We have only to fix the psychological function of Agni,
the priest, the fighter, the worker, the truth-finder, the winner of
beatitude for man; and that has already been fixed for us in the
first hymn of the Rig Veda by Madhuchchhandas' description
of him,—“the Will in works of the Seer true and most rich in
varied inspiration.” Agni is the Deva, the All-See, manifested as conscious-force or, as it would be called in modern language, Divine or Cosmic Will, first hidden and building up the eternal worlds, then manifest, “born”, building up in man the Truth and the Immortality.

Gods and men, says Vishwamitra in effect, kindle this divine force by lighting the fires of the inner sacrifice; they enable it to work by their adoration and submission to it; they express in heaven, that is to say, in the pure mentality which is symbolised by Dyaus, the knowings of the Seers, in other words the illuminations of the Truth-consciousness which exceeds Mind; and they do this in order to make a passage for this divine force which in its strength seeking always to find the word of right self-expression aspires beyond mind. This divine will carrying in all its workings the secret of the divine knowledge, kavikratuh, befriends or builds up the mental and physical consciousness in man, divah prthivyah, perfects the intellect, purifies the discernment so that they grow to be capable of the “knowings of the seers” and by the superconscient Truth thus made conscient in us establishes firmly the Beatitude (vs. 2-3).

The rest of the passage describes the ascent of this divine conscious-force, Agni, this Immortal in mortals who in the sacrifice takes the place of the ordinary will and knowledge of man, from the mortal and physical consciousness to the immortality of the Truth and the Beatitude. The Vedic Rishis speak of five births for man, five worlds of creatures where works are done, pañca janah, pañca kṣṭib or kṣitib. Dyaus and Prithivi represent the pure mental and the physical consciousness; between them is the Antariksha, the intermediate or connecting level of the vital or nervous consciousness. Dyaus and Prithivi are Rodasi, our two firmaments; but these have to be overpassed, for then we find admission to another heaven than that of the pure mind — to the wide, the Vast which is the basis, the foundation (budhna) of the infinite consciousness, Aditi. This Vast is the Truth which supports the supreme triple world, those highest steps or seats (padāni, sadānasi) of Agni, of Vishnu, those supreme Names of the Mother, the cow, Aditi. The Vast or Truth is declared to be
The Seven Rivers

the own or proper seat or home of Agni, svāṁ damam, svāṁ sadah. Agni is described in this hymn ascending from earth to his own seat.

This divine Power is found by the gods visible in the Waters, in the working of the Sisters. These are the sevenfold waters of the Truth, the divine waters brought down from the heights of our being by Indra. First it is secret in the earth’s growths, osadhiḥ, the things that hold her heats, and has to be brought out by a sort of force, by a pressure of the two aranis, earth and heaven. Therefore it is called the child of the earth’s growths and the child of the earth and heaven; this immortal Force is produced by man with pain and difficulty from the workings of the pure mind upon the physical being. But in the divine waters Agni is found visible and easily born in all his strength and in all his knowledge and in all his enjoyment, entirely white and pure, growing ruddy with his action as he increases (v. 3). From his very birth the Gods give him force and splendour and body; the seven mighty Rivers increase him in his joy; they move about this great newborn child and labour over him as the Mares, ásvāḥ (v. 4).

The rivers, usually named dhenaḥ, fostering cows, are here described as ásvāḥ, Mares, because while the Cow is the symbol of consciousness in the form of knowledge, the Horse is the symbol of consciousness in the form of force. Ashwa, the Horse, is the dynamic force of Life, and the rivers labouring over Agni on the earth become the waters of Life, of the vital dynamis or kinesis, the Prana, which moves and acts and desires and enjoys. Agni himself begins as material heat and power, manifests secondarily as the Horse and then only becomes the heavenly fire. His first work is to give as the child of the Waters its full form and extension and purity to the middle world, the vital or dynamic plane, raja ātatavan. He purifies the nervous life in man pervading it with his own pure bright limbs, lifting upward its impulsions and desires, its purified will in works (kratum) by the pure powers of the super-conscient Truth and Wisdom, kavibhiḥ pavitraiḥ. So he wears his vast glories, no longer the broken and limited activity
of desires and instincts, all about the life of the Waters (vs. 4-5).

The sevenfold waters thus rise upward and become the pure mental activity, the Mighty Ones of Heaven. They there reveal themselves as the first eternal ever-young energies, separate streams but of one origin—for they have all flowed from the one womb of the super-conscient Truth—the seven Words or fundamental creative expressions of the divine Mind, \textit{sapta van\={i}h}. This life of the pure mind is not like that of the nervous life which devours its objects in order to sustain its mortal existence; its waters devour not but they do not fail; they are the eternal truth robed in a transparent veil of mental forms; therefore, it is said, they are neither clothed nor naked (v. 6).

But this is not the last stage. The Force rises into the womb or birthplace of this mental clarity (\textit{ghr\={i}tasya}) where the waters flow as streams of the divine sweetness (\textit{sravathe madh\={i}n\={a}m}); there the forms it assumes are universal forms, masses of the vast and infinite consciousness. As a result, the fostering rivers in the lower world are nourished by this descending higher sweetness and the mental and physical consciousness, the two first mothers of the all-effecting Will, become in their entire largeness perfectly equal and harmonised by this light of the Truth, through this nourishing by the infinite Bliss. They bear the full force of Agni, the blaze of his lightnings, the glory and rapture of his universal forms. For where the Lord, the Male, the Bull of the abundance is increased by the wisdom of the super-conscient Truth, there always flow the streams of the clarity and the streams of the bliss (vs. 7-8).

The Father of all things is the Lord and Male; he is hidden in the secret source of things, in the super-conscient; Agni, with his companion gods and with the sevenfold Waters, enters into the super-conscient without therefore disappearing from our conscient existence, finds the source of the honeyed plenty of the Father of things and pours them out on our life. He bears and himself becomes the Son, the pure Kumara, the pure Male, the One, the soul in man revealed in its universality; the mental and physical consciousness in the human being accept him as their
lord and lover; but, though one, he still enjoys the manifold movement of the rivers, the multiple cosmic energies (vs. 9-10).

Then we are told expressly that this infinite into which he has entered and in which he grows, in which the many Waters victoriously reaching their goal (yaśasah) increase him, is the unobstructed vast where the Truth is born, the shoreless infinite, his own natural seat in which he now takes up his home. There the seven rivers, the sisters, work no longer separated though of one origin as on the earth and in the mortal life, but rather as indivisible companions (jāmināṁ apasi svasīnāṁ). In that entire meeting of these great ones Agni moves in all things and upbears all things; the rays of his vision are perfectly straight, no longer affected by the lower crookedness; he from whom the radiances of knowledge, the brilliant herds, were born, now gives them this high and supreme birth; he turns them into the divine knowledge, the immortal consciousness (vs. 11-12).

This also is his own new and last birth. He who was born as the Son of Force from the growths of earth, he who was born as the child of the Waters, is now born in many forms to the goddess of bliss, she who has the entire felicity, that is to say to the divine conscious beatitude, in the shoreless infinite. The gods or divine powers in man using the mind as an instrument reach him there, unite around him, set him to the great work of the world in this new, mighty and effective birth. They, the outshinings of that vast consciousness, cleave to this divine Force as its bright lightnings and from him in the super-conscient, the shoreless vast, his own home, they draw for man the Immortality.

Such then, profound, coherent, luminous behind the veil of figures is the sense of the Vedic symbol of the seven rivers, of the Waters, of the five worlds, of the birth and ascent of Agni which is also the upward journey of man and the Gods whose image man forms in himself from level to level of the great hill of being (sānoḥ sānum). Once we apply it and seize the true sense of the symbol of the Cow and the symbol of the Soma with a just conception of the psychological functions of the Gods, all the apparent incoherences and obscurities and far-fetched chaotic confusion of these ancient hymns disappears in a
moment. Simply, easily, without straining there disengages itself the profound and luminous doctrine of the ancient Mystics, the secret of the Veda.
Chapter XII

The Herds of the Dawn

THE SEVEN Rivers of the Veda, the Waters, āpah, are usually designated in the figured Vedic language as the seven Mothers or the seven fostering Cows, sapta dhenaṭavah. The word āpah itself has, covertly, a double significance; for the root ap meant originally not only to move from which in all probability is derived the sense of waters, but to be or bring into being, as in apattyā, a child, and the Southern Indian appā, father. The seven Waters are the waters of being; they are the Mothers from whom all forms of existence are born. But we meet also another expression, sapta gāvah, the seven Cows or the seven Lights, and the epithet saptagu, that which has seven rays. Gū (gavah) and go (gāvah) bear throughout the Vedic hymns this double sense of cows and radiances. In the ancient Indian system of thought being and consciousness were aspects of each other, and Aditi, infinite existence from whom the gods are born, described as the Mother with her seven names and seven seats (dhāmāni), is also conceived as the infinite consciousness, the Cow, the primal Light manifest in seven Radiances, sapta gāvah.

The sevenfold principle of existence is therefore imaged from the one point of view in the figure of the Rivers that arise from the ocean, sapta dhenaṭavah, from the other in the figure of the Rays of the all-creating Father, Surya Savitri, sapta gāvah.

The image of the Cow is the most important of all the Vedic symbols. For the ritualist the word go means simply a physical cow and nothing else, just as its companion word, āsva, means simply a physical horse and has no other sense, or as ghrta means only water or clarified butter, viṇa only a son or a retainer or servant. When the Rishi prays to the Dawn, gomad vīravat dhehi ratnam uṣo āsvaṭ, the ritualistic commentator sees in the invocation only an entreaty for “pleasant wealth to which are attached cows, men (or sons) and horses”. If on the other
hand these words are symbolic, the sense will run, “Confirm in us a state of bliss full of light, of conquering energy and of force of vitality.” It is therefore necessary to decide once for all the significance of the word go in the Vedic hymns. If it proves to be symbolic, then these other words, — āsva, horse, vīra, man or hero, apatya or prajā, offspring, bīranyā, gold, vāja, plenty (food, according to Sayana), — by which it is continually accompanied, must perforce assume also a symbolic and a kindred significance.

The image of the Cow is constantly associated in Veda with the Dawn and the Sun; it also recurs in the legend of the recovery of the lost cows from the cave of the Panis by Indra and Brihaspati with the aid of the hound Sarama and the Angiras Rishis. The conception of the Dawn and the legend of the Angirases are at the very heart of the Vedic cult and may almost be considered as the key to the secret of the significance of Veda. It is therefore these two that we must examine in order to find firm ground for our inquiry.

Now even the most superficial examination of the Vedic hymns to the Dawn makes it perfectly clear that the cows of the Dawn, the cows of the Sun are a symbol for Light and cannot be anything else. Sayana himself is obliged in these hymns to interpret the word sometimes as cows, sometimes as rays, — careless as usual of consistency; sometimes he will even tell us that go like rtam, the word for truth, means water. As a matter of fact it is evident that we are meant to take the word in a double sense, “light” as the true significance, “cow” as the concrete image and verbal figure.

The sense of “rays” is quite indisputable in such passages as the third verse of Madhuchchhandas’ hymn to Indra, I.7, “Indra for far vision made the Sun to ascend in heaven: he sped him all over the hill by his rays,” vi gobhir adrim airayat.¹ But at the same time, the rays of Surya are the herds of the Sun, the kine

¹ We may also translate “He sent abroad the thunderbolt with its lights”; but this does not make as good and coherent a sense; even if we take it, gobhir must mean “radiances” not “cows”.

www.holybooks.com
of Helios slain by the companions of Odysseus in the Odyssey, stolen by Hermes from his brother Apollo in the Homeric hymn to Hermes. They are the cows concealed by the enemy Vala, by the Panis; when Madhuchchhandas says to Indra, “Thou didst uncover the hole of Vala of the Cows”, he means that Vala is the concealer, the withholder of the Light and it is the concealed Light that Indra restores to the sacrificer. The recovery of the lost or stolen cows is constantly spoken of in the Vedic hymns and its sense will be clear enough when we come to examine the legend of the Panis and of the Angirases.

Once this sense is established, the material explanation of the Vedic prayer for “cows” is at once shaken; for if the lost cows for whose restoration the Rishis invoke Indra, are not physical herds stolen by the Dravidians but the shining herds of the Sun, of the Light, then we are justified in considering whether the same figure does not apply when there is the simple prayer for “cows” without any reference to any hostile interception. For instance in I.4.2 it is said of Indra, the maker of perfect forms who is as a good milker in the milking of the cows, that his ecstasy of the Soma-Wine is verily “cow-giving”, godā id revato madah. It is the height of absurdity and irrationality to understand by this phrase that Indra is a very wealthy god and, when he gets drunk, exceedingly liberal in the matter of cow-giving. It is obvious that as the cow-milking in the first verse is a figure, so the cow-giving in the second verse is a figure. And if we know from other passages of the Veda that the Cow is the symbol of Light, we must understand here also that Indra, when full of the Soma-ecstasy, is sure to give us the Light.

In the hymns to the Dawn the symbolic sense of the cows of light is equally clear. Dawn is described always as gomati, which must mean, obviously, luminous or radiant; for it would be nonsense to use “cowful” in a literal sense as the fixed epithet of the Dawn. But the image of the cows is there in the epithet; for Usha is not only gomati, she is gomatī aśvavatī; she has always with her her cows and her horses. She creates light for all the world and opens out the darkness as the pen of the Cow, where we have without any possibility of mistake the cow as the
symbol of light, (I.92.4). We may note also that in this hymn I.92, the Ashwins are asked to drive downward their chariot on a path that is radiant and golden, gomad bhiranyavad. Moreover Dawn is said to be drawn in her chariot sometimes by ruddy cows, sometimes by ruddy horses. “She yokes her host of the ruddy cows”; yunkte gavām aruṇānām anikam (I.124.11), — where the second meaning “her host of the ruddy rays” stands clear behind the concrete image. She is described as the mother of the cows or radiances; gavāṁ janitī akṛta pra ketum (I.124.5), “the Mother of the cows (radiances) has created vision”, and it is said elsewhere of her action, “vision” or “perception has dawned now where nought was”; and again it is clear that the cows are the shining herds of the Light. She is also praised as “the leader of the shining herds”, netrī gavām, VII.76.6; and there is an illuminating verse in which the two ideas are combined, “the Mother of the Herds, the guide of the days”, gavāṁ mātā netrī ahnām (VII.77.2). Finally, as if to remove the veil of the image entirely, the Veda itself tells us that the herds are a figure for the rays of the Light, “her happy rays come into sight like cows released into movement” — prati bhadrā adṛkṣata gavām sargā na raśmayah (IV.52.5). And we have the still more conclusive verse, VII.79.2, “Thy cows (rays) remove the darkness and extend the Light”; saṁ te gāvas tama ā vartayanti, jyotir yacchanti.

But Dawn is not only drawn by these shining herds; she brings them as a gift to the sacrificer; she is, like Indra in his Soma-ecstasy, a giver of the Light. In a hymn of Vasishtha (VII.75) she is described as sharing in the action of the gods by which the strong places where the herds are concealed are broken open and they are given to men; “True with the gods who are true, great with the gods who are great, she breaks open the strong places and gives of the shining herds; the cows low towards the dawn,” — rujad drdhāni dadad uriyāṇām, prati

2 It cannot of course be disputed that go means light in the Veda e.g. when it is said that Vritra is slain gavā, by light, there is no question of the cow; the question is of the use of the double sense and of the cow as a symbol.
And in the very next verse she is asked to confirm or establish for the sacrificers gomad ratnam aśvāvat purubhojah, a state of bliss full of the light (cows), of the horses (vital force) and of many enjoyments. The herds which Usha gives are therefore the shining troops of the Light recovered by the gods and the Angiras Rishis from the strong places of Vala and the Panis and the wealth of cows (and horses) for which the Rishis constantly pray can be no other than a wealth of this same Light; for it is impossible to suppose that the cows which Usha is said to give in the seventh verse of the hymn are different from the cows which are prayed for in the eighth, — that the word in the former verse means light and in the next physical cows and that the Rishi has forgotten the image he was using the very moment it has fallen from his tongue.

Sometimes the prayer is not for luminous delight or luminous plenitude, but for a luminous impulsion or force; “Bring to us, O daughter of Heaven, luminous impulses along with the rays of the Sun,” gomatīr iṣa ā vahā duhitar divah, sākam sūryasya rasmibhiḥ, V.79.8. Sayana explains that this means “shining foods”, but it is obviously nonsense to talk of radiant foods being brought by Dawn with the rays of the Sun. If iṣ means food, then we have to understand by the phrase “food of cow’s flesh”, but, although the eating of cow’s flesh was not forbidden in the early times, as is apparent from the Brahmanas, still that this sense which Sayana avoids as shocking to the later Hindu sentiment, is not intended — it would be quite as absurd as the other, — is proved by another verse of the Rig Veda in which the Ashwins are invoked to give the luminous impulsion that carries us through to the other side of the darkness, yā nah piṣparad aśvinā jyotiṣmati tamas tirah, tāṁ asme rāṣṭhāṁ iṣam (I.46.6).

We can perceive from these typical examples how pervading is this image of the Cow of Light and how inevitably it points to a psychological sense for the Veda. A doubt, however, intervenes. Why should we not, even accepting this inevitable conclusion that the cow is an image for Light, understand it to mean simply the light of day as the language of the Veda seems to intend?
Why suppose a symbol where there is only an image? Why invite the difficulty of a double figure in which “cow” means light of dawn and light of dawn is the symbol of an inner illumination? Why not take it that the Rishis were praying not for spiritual illumination, but for daylight?

The objections are manifold and some of them overwhelming. If we assume that the Vedic hymns were composed in India and the dawn is the Indian dawn and the night the brief Indian night of ten or twelve hours, we have to start with the concession that the Vedic Rishis were savages overpowered by a terror of the darkness which they peopled with goblins, ignorant of the natural law of the succession of night and day — which is yet beautifully hymned in many of the Suktas, — and believed that it was only by their prayers and sacrifices that the Sun rose in the heavens and the Dawn emerged from the embrace of her sister Night. Yet they speak of the undeviating rule of the action of the Gods, and of Dawn following always the path of the eternal Law or Truth! We have to suppose that when the Rishi gives vent to the joyous cry “We have crossed over to the other shore of this darkness!”, it was only the normal awakening to the daily sunrise that he thus eagerly hymned. We have to suppose that the Vedic peoples sat down to the sacrifice at dawn and prayed for the light when it had already come. And if we accept all these improbabilities, we are met by the clear statement that it was only after they had sat for nine or for ten months that the lost light and the lost sun were recovered by the Angiras Rishis. And what are we to make of the constant assertion of the discovery of the Light by the Fathers; — “Our fathers found out the hidden light, by the truth in their thoughts they brought to birth the Dawn,” gūḍham jyotih pitaro anvavindaḥ, satyamantrā ajanayan uśāsam (VII.76.4). If we found such a verse in any collection of poems in any literature, we would at once give it a psychological or a spiritual sense; there is no just reason for a different treatment of the Veda.

If, however, we are to give a naturalistic explanation and no other to the Vedic hymns, it is quite clear that the Vedic Dawn and Night cannot be the Night and Dawn of India; it
is only in the Arctic regions that the attitude of the Rishis towards these natural circumstances and the statements about the Angirases become at all intelligible. But though it is extremely probable that the memories of the Arctic home enter into the external sense of the Veda, the Arctic theory does not exclude an inner sense behind the ancient images drawn from Nature nor does it dispense with the necessity for a more coherent and straightforward explanation of the hymns to the Dawn.

We have, for instance, the hymn of Praskanwa Kanwa to the Ashwins (I.46) in which there is the reference to the luminous impulsion that carries us through to the other shore of the darkness. This hymn is intimately connected with the Vedic idea of the Dawn and the Night. It contains references to many of the fixed Vedic images, to the path of the Truth, the crossing of the rivers, the rising of the Sun, the connection between the Dawn and the Ashwins, the mystic effect and oceanic essence of the Soma Wine.

"Lo, the Dawn than which there is none higher, opens out full of delight in the Heavens; O Ashwins, the Vast of you I affirm, ye of whom the Ocean is the mother, accomplishers of the work who pass beyond through the mind to the felicities and, divine, find that substance by the thought. . . . O Lords of the Voyage, who mentalise the word, this is the dissolver of your thinkings,—drink ye of the Soma violently; give to us that impulsion, O Ashwins which, luminous, carries us through beyond the darkness. Travel for us in your ship to reach the other shore beyond the thoughts of the mind. Yoke, O Ashwins, your car,—your car that becomes the vast oared ship in Heaven, in the crossing of its rivers. By the thought the powers of Delight have been yoked. The Soma-powers of delight in heaven are that substance in the place of the Waters. But where shall you cast aside the veil you have made to conceal you? Nay, Light has been born for the joy of the Soma; — the Sun that was dark has shot out its tongue towards the Gold. The path of the Truth has come into being by which we shall travel to that other shore; seen is all the wide way through Heaven. The seeker grows in his being towards increasing manifestation after manifestation.
of the Ashwins when they find satisfaction in the ecstasy of the Soma. Do ye, dwelling (or, shining) in the all-luminous Sun, by the drinking of the Soma, by the Word come as creators of the bliss into our humanity. Dawn comes to us according to your glory when you pervade all our worlds and you win the Truths out of the Nights. Both together drink, O Ashwins, both together extend to us the peace by expandings whose wholeness remains untorn."

This is the straightforward and natural sense of the hymn and its intention is not difficult to follow if we remember the main ideas and images of the Vedic doctrine. The Night is clearly the image of an inner darkness; by the coming of the Dawn the Truths are won out of the Nights. This is the rising of the Sun which was lost in the obscurity — the familiar figure of the lost sun recovered by the Gods and the Angiras Rishis — the sun of Truth, and it now shoots out its tongue of fire towards the golden Light: — for hiranya, gold is the concrete symbol of the higher light, the gold of the Truth, and it is this treasure not golden coin for which the Vedic Rishis pray to the Gods. This great change from the inner obscurcation to the illumination is effected by the Ashwins, lords of the joyous upward action of the mind and the vital powers, through the immortal wine of the Ananda poured into mind and body and there drunk by them. They mentalise the expressive Word, they lead us into the heaven of pure mind beyond this darkness and there by the Thought they set the powers of the Delight to work. But even over the heavenly waters they cross, for the power of the Soma helps them to dissolve all mental constructions, and they cast aside even this veil; they go beyond Mind and the last attaining is described as the crossing of the rivers, the passage through the heaven of the pure mind, the journey by the path of the Truth to the other side. Not till we reach the highest supreme, paramā parāvat, do we rest at last from the great human journey.

We shall see that not only in this hymn, but everywhere Dawn comes as a bringer of the Truth, is herself the outshining of the Truth. She is the divine Dawn and the physical dawning is only her shadow and symbol in the material universe.
Chapter XIII

Dawn and the Truth

Usha is described repeatedly as the Mother of the Cows. If then the cow is a Vedic symbol for the physical light or for spiritual illumination the phrase must either bear this sense that she is the mother or source of the physical rays of the daylight or else that she creates the radiances of the supreme Day, the splendour and clarity of the inner illumination. But we see in the Veda that Aditi, the Mother of the Gods, is described both as the Cow and as the general Mother; she is the Supreme Light and all radiances proceed from her. Psychologically, Aditi is the supreme or infinite Consciousness, mother of the gods, in opposition to Danu or Diti, the divided consciousness, mother of Vritra and the other Danavas — enemies of the gods and of man in his progress. In a more general aspect she is the source of all the cosmic forms of consciousness from the physical upwards; the seven cows, sapta gāvah, are her forms and there are, we are told, seven names and seven seats of the Mother. Usha as the mother of the cows can only be a form or power of this supreme Light, of this supreme Consciousness, of Aditi. And in fact, we do find her so described in I.113.19, mātā devānām aditer anikam, “Mother of the gods, form (or, power) of Aditi.”

But the illumining dawn of the higher or undivided Consciousness is always the dawn of the Truth; if Usha is that illumining dawn, then we are bound to find her advent frequently associated in the verses of the Rig Veda with the idea of the Truth, the Ritam. And such association we do repeatedly find. For, first of all, Usha is described as “following effectively the path of the Truth,” r̥tasya panthām anveti sādhu. Here neither the ritualistic nor the naturalistic sense suggested for r̥tam can at

1 Not that the word Aditi is etymologically the privative of Diti; the two words derive from entirely different roots, ad and di.
all apply; there would be no meaning in a constant affirmation that Dawn follows the path of the sacrifice or follows the path of the water. We can only escape from the obvious significance if we choose to understand by \textit{panthā rtasya} the path, not of the Truth, but of the Sun. But the Veda describes rather the Sun as following the path of Usha and this would be the natural image suggested to an observer of the physical Dawn. Moreover, even if the phrase did not clearly in other passages mean the path of the Truth, the psychological significance would still intervene; for the sense would then be that the dawn of illumination follows the path of the True or the Lord of the Truth, Surya Savitri.

We have precisely the same idea repeated but with still clearer and fuller psychological indications in I.124.3; \textit{ṛtasya pantham anvetai sādhuv, praṇāṇatīva na diśo mināti:} “She moves according to the path of the Truth and, as one that knows, she limits not the regions.” \textit{Disah,} we may note, has a double sense; but it is not necessary to insist upon it here. Dawn adheres to the path of the Truth and because she has this knowledge or perception she does not limit the infinity, the \textit{bṛhat}, of which she is the illumination. That this is the true sense of the verse is proved beyond dispute, expressly, unmistakably, by a Rik of the fifth Mandala (V.80.1) which describes Usha \textit{dyutad-yāmānāṁ bṛhatim ṛtena ṛtāvarīṁ svār āvahantīm,} “of a luminous movement, vast with the Truth, supreme in (or possessed of) the Truth, bringing with her Swar.” We have the idea of the Vast, the idea of the Truth, the idea of the solar light of the world of Swar; and certainly all these notions are thus intimately and insistently associated with no mere physical Dawn! We may compare VII.75.1, \textit{vyuṣā āvo divijā ṛtena, āviṣṭṛvivānā mahīmānam āgāt;} “Dawn born in heaven opens out things by the Truth, she comes manifesting the greatness.” Again we have Dawn revealing all things by the power of the Truth and the result described as the manifestation of a certain Vastness.

Finally we have the same idea described, but with the use of another word for Truth, \textit{satyā} which does not, like \textit{ṛtam,} lend itself to any ambiguity, \textit{satyā satyebhīr mahatī mahadbhir}
devī devebhir (VII.75.7), “Dawn true in her being with the gods who are true, vast with the Gods who are vast.” This “truth” of the Dawn is much insisted upon by Vamadeva in one of his hymns, IV.51; for there not only does he speak of the Dawns “encompassing the worlds immediately with horses yoked by the Truth,” ṛtayugbhīr aśvaiḥ (cf. VI.65.2) but he speaks of them as bhadraḥ ṛtājātasyāḥ, “happy, and true because born from the Truth”; and in another verse he describes them as “the goddesses who awake from the seat of the Truth.”

This close connection of bhadra and ṛtā reminds us of the same connection of ideas in Madhuchchhandas’ Hymn to Agni. In our psychological interpretation of the Veda we are met at every turn by the ancient conception of the Truth as the path to the Bliss. Usha, the dawn of the illumination of the Truth, must necessarily bring also the joy and the beatitude. This idea of the Dawn as the bringer of delight we find constantly in the Veda and Vasishtha gives a very positive expression to it in VII.81.3, yā vahasi puruṣaparāh ratnam na dāsūse mayāḥ, “thou who bearest to the giver the beatitude as a manifold and desirable ecstasy.”

A common Vedic word is the word sūṃrtā which Sayana interprets as “pleasant and true speech”; but it seems to have often the more general sense of “happy truths”. Dawn is sometimes described as ṛtāvari, full of the Truth, sometimes as sūṃtāvari. She comes uttering her true and happy words, sūṃtā śrayantā. As she has been described as the leader of the radiant herds and the leader of the days, so she is described as the luminous leader of happy truths, bhāsvatī netrī sūṃtānām (I.92.7). And this close connection in the mind of the Vedic Rishis between the idea of light, of the rays or cows, and the idea of the truth is even more unmistakable in another Rik, I.92.14, gomati aśvāvati vibhāvari . . . sūṃtāvati, “Dawn with thy shining herds, with thy steeds, widely luminous, full of happy truths.” A similar but yet more open phrase in I.48.2 points the significance of this collocation of epithets, aśvāvatī gomātī viśvasuvīdāḥ, “Dawns with their swiftnesses (horses), their radiances (herds), rightly knowing all things.”
These are by no means all the indications of the psychological character of the Vedic Dawn that we find in the Rig Veda. Dawn is constantly represented as awakening to vision, perception, right movement. “The goddess,” says Gotama Rahugana, “fronts and looks upon all the worlds, the eye of vision shines with an utter wideness; awakening all life for movement she discovers speech for all that thinks,” viśvasya vācam avidan manāyoh (I.92.9). We have here a Dawn that releases life and mind into their fullest wideness and we ignore the whole force of the words and phrases chosen by the Rishi if we limit the suggestion to a mere picture of the reawakening of earthly life in the physical dawning. And even if here the word used for the vision brought by the Dawn, caksuḥ, is capable of indicating only physical sight, yet in other passages it is ketuh which means perception, a perceptive vision in the mental consciousness, a faculty of knowledge. Usha is pratetāḥ, she who has this perceptive knowledge. Mother of the radiances, she has created this perceptive vision of the mind; gavām janitṛi akṛta pra ketum (I.124.5). She is herself that vision,—“Now perceptive vision has broken out into its wide dawn where nought was before,” vi nūnam ucchād asati pra ketuḥ (I.124.11). She is by her perceptive power possessed of the happy truths, cikītviṣ-sūmrṭāvari (IV.52.4).

This perception, this vision is, we are told, that of the Immortality, amṛtasya ketuḥ (III.61.3); it is the light, in other words, of the Truth and the Bliss which constitute the higher or immortal consciousness. Night in the Veda is the symbol of our obscure consciousness full of ignorance in knowledge and of stumblings in will and act, therefore of all evil, sin and suffering; light is the coming of the illuminated higher consciousness which leads to truth and happiness. We find constantly the opposition of the two words duritam and suvitam. Duritam means literally stumbling or wrong going, figuratively all that is wrong and evil, all sin, error, calamity; suvitam means literally right or good going and expresses all that is good and happy, it means especially the felicity that comes by following the right path. Thus Vasishtha says of the goddess (VII.78.2), “Dawn
comes divine repelling by the Light all darknesses and evils,”
$v ś v ā \ t a m ā ī s i \ d u r i t ā$; and in a number of verses the goddess is
described as awakening, impelling or leading men to right going,
to the happiness, suvītāya.

Therefore she is the leader not only of happy truths, but
of our spiritual wealth and joy, bringer of the felicity which
is reached by man or brought to him by the Truth, $e ś ā \ n e t r ī$
$r ā d h a s ā h \ s u r t ā n ā m$ (VII.76.7). This wealth for which the Rishis
pray is described under the figure of material riches; it is $g o m a d$
avad viravad or it is $g o m a d$ aśvavad rathavac ca rādhaḥ. Go,
the cow, aśva, the horse, praśa or apatya, the offspring, nṛ or
vīra, the man or hero, hiranya, gold, ratha, the chariot, śravas, —
food or fame, according to the ritualist interpretation, — these
are the constituents of the wealth desired by the Vedic sages.
Nothing, it would seem, could be more matter-of-fact, earthy,
material; these are indeed the blessings for which a race of lusty
barbarians full of vigorous appetite, avid of earth’s goods would
pray to their primitive gods. But we have seen that hiranya is
used in another sense than that of earthly gold. We have seen
that the “cows” return constantly in connection with the Dawn
as a figure for the Light and we have seen that this light is
connected with mental vision and with the truth that brings the
bliss. And aśva, the horse, is always in these concrete images
of psychological suggestions coupled with the symbolic figure
of the cow: Dawn is gomati aśvāvati. Vasishtha has a verse
(VII.77.3) in which the symbolic sense of the Vedic Horse comes
out with great power and clearness,—

$D e v ā n ā m \ c a k ś u h \ s u b h a g ā \ v a h a n t i,$
$s v e t a n n a y a n t i \ s u d r i s ī k a m \ a ś v a m ;$
$U ś ā \ a d a r ś i \ r a ś m i b h i r \ v y a k t ā ,$
$c i t r ā m a g h ā \ v i ś v a m \ a n u \ p r a b h ī t ā t ā .$

“Happy, bringing the gods’ eye of vision, leading the white
